MSMA PUBLIC AFFAIRS CONFERENCE 7

115th ANNUAL SESSION PRELIMINARY PROGRAM 10

Contents on Page 6

115th MSMA Annual Session
March 29-April 1, 1973 St. Louis

Everybody experiences psychic tension.

Most people can handle this tension.

Some people develop excessive psychic tension and need your counselin

and a few may need counseling
and the psychotropic action of Valium® (diazepam).

Before deciding to make Valium iazepam) part of your treatment an, check on whether or not the itient is presently taking drugs id, if so, what his response has een. Along with the medical and ocial history, this information can elp you determine initial dosage, ie possibility of side effects and ie ultimate prospects of success failure.

While Valium can be a most elpful adjunct to your counseling, should be prescribed only as long excessive psychic tension persists and should be discontinued hen you decide it has accomlished its therapeutic task. In eneral, when dosage guidelines re followed, Valium is well olerated (see Dosage). For conenience it is available in 2-mg, 5-mg nd 10-mg tablets.

Drowsiness, fatigue and ataxia ave been the most commonly reorted side effects.

Until response is determined, atients receiving Valium should e cautioned against engaging in azardous occupations requiring omplete mental alertness, such s driving or operating machinery.

ROCHE
Roche Laboratories
Division of Hoffmann-La Roche Inc.
Nutley, N.J. 07110

Before prescribing, please consult complete product information, a summary of which follows:

Indications: Tension and anxiety states; somatic complaints which are concomitants of emotional factors; psychoneurotic states manifested by tension, anxiety, apprehension, fatigue, depressive symptoms or agitation; symptomatic relief of acute agitation, tremor, delirium tremens and hallucinosis due to acute alcohol withdrawal; adjunctively in skeletal muscle spasm due to reflex spasm to local pathology, spasticity caused by upper motor neuron disorders, athetosis, stiff-man syndrome, convulsive disorders (not for sole therapy).

Contraindicated: Known hypersensitivity to the drug. Children under 6 months of age. Acute narrow angle glaucoma; may be used in patients with open angle glaucoma who are receiving appropriate therapy.

Warnings: Not of value in psychotic patients. Caution against hazardous occupations requiring complete mental alertness. When used adjunctively in convulsive disorders, possibility of increase in frequency and/or severity of grand mal seizures may require increased dosage of standard anticonvulsant medication; abrupt withdrawal may be associated with temporary increase in frequency and/or severity of seizures. Advise against simultaneous ingestion of alcohol and other CNS depressants. Withdrawal symptoms (similar to those with barbiturates and alcohol) have occurred following abrupt discontinuance (convulsions, tremor, abdominal and muscle cramps, vomiting and sweating). Keep addiction-prone individuals under careful surveillance because of their predisposition to habituation and dependence. In pregnancy, lactation or women of childbearing age, weigh potential benefit against possible hazard.

Precautions: If combined with other psychotropics or anticonvulsants, consider carefully pharmacology of agents employed; drugs such as phenothiazines, narcotics, barbiturates, MAO inhibitors and other antidepressants may potentiate its action. Usual precautions indicated in patients severely depressed, or with latent depression, or with suicidal tendencies. Observe usual precautions in impaired renal or hepatic function. Limit dosage to smallest effective amount in elderly and debilitated to preclude ataxia or oversedation.

Side Effects: Drowsiness, confusion, diplopia, hypotension, changes in libido, nausea, fatigue, depression, dysarthria, jaundice, skin rash, ataxia, constipation, headache, incontinence, changes in salivation, slurred speech, tremor, vertigo, urinary retention, blurred vision. Paradoxical reactions such as acute hyperexcited states, anxiety, hallucinations, increased muscle spasticity, insomnia, rage, sleep disturbances, stimulation have been reported; should these occur, discontinue drug. Isolated reports of neutropenia, jaundice; periodic blood counts and liver function tests advisable during long-term therapy.

Dosage: Individualize for maximum beneficial effect. *Adults:* Tension, anxiety and psychoneurotic states, 2 to 10 mg b.i.d. to q.i.d.; alcoholism, 10 mg t.i.d. or q.i.d. in first 24 hours, then 5 mg t.i.d. or q.i.d. as needed; adjunctively in skeletal muscle spasm, 2 to 10 mg t.i.d. or q.i.d.; adjunctively in convulsive disorders, 2 to 10 mg b.i.d. to q.i.d. *Geriatric or debilitated patients:* 2 to 2½ mg, 1 or 2 times daily initially, increasing as needed and tolerated. (See Precautions.) *Children:* 1 to 2½ mg t.i.d. or q.i.d. initially, increasing as needed and tolerated (not for use under 6 months).

Supplied: Valium® (diazepam) Tablets, 2 mg, 5 mg and 10 mg; bottles of 100 and 500. All strengths also available in Tel-E-Dose® packages of 1000.

THE mudranes®

All Mudranes are bronchodilator-mucolytic in action, and are indicated for symptomatic relief of bronchial asthma, emphysema, bronchiectasis and chronic bronchitis. **MUDRANE tablets** contain 195 mg. potassium iodide; 130 mg. aminophylline; 21 mg. phenobarbital (Warning: may be habit-forming); 16 mg. ephedrine HCl. **Dosage** is one tablet with full glass of water, 3 or 4 times a day. **Precautions** are those for aminophylline-phenobarbital-ephedrine combinations. **Iodide side-effects:** May cause nausea. Very long use may cause goiter. Discontinue if symptoms of iodism develop. **Iodide contraindications:** Tuberculosis; pregnancy (to protect the fetus against possible depression of thyroid activity). **MUDRANE-2 tablets** contain 195 mg. potassium iodide; 130 mg. aminophylline. **Dosage** is one tablet with full glass of water, 3 or 4 times a day. **Precautions** are those for aminophylline. **Iodide side-effects and contraindications are listed above. MUDRANE GG tablets** contain 100 mg. glyceryl guaiacolate; 130 mg. aminophylline; 21 mg. phenobarbital (Warning: may be habit-forming); 16 mg. ephedrine HCl. **Dosage** is one tablet with full glass of water, 3 or 4 times a day. **Precautions** are those for aminophylline-phenobarbital-ephedrine combinations. **MUDRANE GG-2 tablets** contain 100 mg. glyceryl guaiacolate; 130 mg. aminophylline. **Dosage** is one tablet with full glass of water, 3 or 4 times a day. **Precautions:** Those for aminophylline. **MUDRANE GG Elixir.** Each teaspoonful (5 cc) contains 26 mg. glyceryl guaiacolate; 20 mg. theophylline; 5.4 mg. phenobarbital (Warning: may be habit-forming); 4 mg. ephedrine HCl. **Dosage:** Children, 1 cc for each 10 lbs. of body weight; one teaspoonful (5 cc) for a 50 lb. child. Dose may be repeated 3 or 4 times a day. Adult, one tablespoonful, 4 times daily. All doses should be followed with ½ to full glass of water. **Precautions:** See those listed above for Mudrane GG tablets.

MUDRANE—original formula

First choice

MUDRANE-2

When ephedrine is too exciting
or is contraindicated

MUDRANE GG

During pregnancy or when K.I. is
contraindicated or not tolerated

MUDRANE GG-2

A counterpart for Mudrane-2

MUDRANE GG ELIXIR

For pediatric use
or where liquids are preferred

Clinical specimens
available to physicians.

Information for Contributors

Articles are accepted for publication on condition that they are contributed solely to this journal. Material appearing in Missouri Medicine is protected by copyright. Permission will be granted on request for reproduction in reputable publications provided proper credit is given and author gives permission.

Manuscripts should be typewritten, double spaced, and the original with one carbon copy submitted. Retain another carbon copy for proofreading. Used manuscripts are not returned. School and hospital appointments of the author should accompany the manuscript. It is desirable that a synopsis-abstract of approximately 135 words accompany the manuscript. References should be arranged at the end of the article in the order in which the references are cited in the text. The reference should give name of author, title of article, name of periodical, volume number, initial page number and year. Authors are responsible for reference accuracy.

Illustrations should be glossy prints or drawings in India ink on white paper. They should not be mounted and name of author and figure number should be penciled lightly on the backs. Legends should appear on a separate sheet. Colored illustrations will be used when suitable if author assumes the actual cost.

Legal difficulties may arise from unauthorized use of names, initials or photographs in which individuals can be identified. Permission should be secured from patient or legal guardian and signed duplicate or photostat submitted with such photographs or identification. The Editor and Editorial Board assume no responsibility for the opinions and claims expressed in articles contributed by authors. If citation of an institution related to the article is made, approval of the chief of service should be given in a letter accompanying the article.

Reprint order blanks will accompany proof, which will be sent to authors prior to publication.

All material other than scientific should be received prior to the first of the month preceding month of publication.

Please give notice of change of address at least one month in advance of the change, giving old and new addresses.

QUALITY CONTROL MARK

Sally's back in sew biz! After an arthritic flare-up.

tant Note: This drug is not a simple analgesic. Do
lminister casually. Carefully evaluate patients be-
tarting treatment and keep them under close su-
ion. Obtain a detailed history, and complete
cal and laboratory examination (complete hemo-
urinalysis, etc.) before prescribing and at fre-
intervals thereafter. Carefully select patients,
ng those responsive to routine measures, contra-
ted patients or those who cannot be observed fre-
ly. Warn patients not to exceed recommended
e. Short-term relief of severe symptoms with the
est possible dosage is the goal of therapy. Dosage
d be taken with meals or a full glass of milk. Sub-
e alka capsules for tablets if dyspeptic symptoms
. Patients should discontinue the drug and report
diately any sign of: fever, sore throat, oral lesions
ptoms of blood dyscrasia); dyspepsia, epigastric
symptoms of anemia, black or tarry stools or other
nce of intestinal ulceration or hemorrhage, skin re-
ns, significant weight gain or edema. A one-week
eriod is adequate. Discontinue in the absence of a
able response. Restrict treatment periods to one
in patients over sixty.
ations: Acute gouty arthritis, rheumatoid arthritis,
natoid spondylitis.
raindications: Children 14 years or less; senile pa-
; history or symptoms of G.I. inflammation or ul-
ion including severe, recurrent or persistent dys-
a; history or presence of drug allergy; blood
asias; renal, hepatic or cardiac dysfunction; hy-
nsion; thyroid disease; systemic edema;
atitis and salivary gland enlargement due to the
polymyalgia rheumatica and temporal arteritis;
nts receiving other potent chemotherapeutic
ts, or long-term anticoagulant therapy.
ings: Age, weight, dosage, duration of therapy, ex-
ce of concomitant diseases, and concurrent potent
otherapy affect incidence of toxic reactions. Care-
nstruct and observe the individual patient, espe-
the aging (forty years and over) who have
ased susceptibility to the toxicity of the drug. Use
st effective dosage. Weigh initially unpredictable
fits against potential risk of severe, even fatal, re-
ns. The disease condition itself is unaltered by the
. Use with caution in first trimester of pregnancy
n nursing mothers. Drug may appear in cord blood
reast milk. Serious, even fatal, blood dyscrasias,

Butazolidin® alka Geigy

Each capsule contains:
100 mg. phenylbutazone USP
100 mg. dried aluminum hydroxide gel USP
150 mg. magnesium trisilicate USP

If it doesn't work in a week, forget it.

including aplastic anemia, may occur suddenly despite regular hemograms, and may become manifest days or weeks after cessation of drug. Any significant change in total white count, relative decrease in granulocytes, appearance of immature forms, or fall in hematocrit should signal immediate cessation of therapy and complete hematologic investigation. Unexplained bleeding involving CNS, adrenals, and G.I. tract has occurred. The drug may potentiate action of insulin, sulfonylurea, and sulfonamide-type agents. Carefully observe patients taking these agents. Nontoxic and toxic goiters and myxedema have been reported (the drug reduces iodine uptake by the thyroid). Blurred vision can be a significant toxic symptom worthy of a complete ophthalmological examination. Swelling of ankles or face in patients under sixty may be prevented by reducing dosage. If edema occurs in patients over sixty, discontinue drug.

Precautions: The following should be accomplished at regular intervals: Careful detailed history for disease being treated and detection of earliest signs of adverse reactions; complete physical examination including check of patient's weight; complete weekly (especially for the aging) or an every two week blood check; pertinent laboratory studies. Caution patients about participating in activity requiring alertness and coordination, as driving a car, etc. Cases of leukemia have been reported in patients with a history of short- and long-term therapy. The majority of these patients were over forty. Remember that arthritic-type pains can be the presenting symptom of leukemia.

Adverse Reactions: This is a potent drug; its misuse can lead to serious results. Review detailed information before beginning therapy. Ulcerative esophagitis, acute and reactivated gastric and duodenal ulcer with perforation and hemorrhage, ulceration and perforation of large bowel, occult G.I. bleeding with anemia, gastritis, epigastric pain, hematemesis, dyspepsia, nausea, vomiting and diarrhea, abdominal distention, agranulocytosis, aplastic anemia, hemolytic anemia, anemia due to blood loss including occult G.I. bleeding, thrombocytopenia, pancytopenia, leukemia, leukopenia, bone marrow depression, sodium and chloride retention, water retention and edema, plasma dilution, respiratory alkalosis, metabolic acidosis, fatal and nonfatal hepatitis (cholestasis may or may not be prominent), petechiae, purpura without thrombocytopenia, toxic pruritus, erythema nodosum, erythema multiforme, Stevens-Johnson syndrome, Lyell's syndrome (toxic necrotizing epidermolysis), exfoliative dermatitis, serum sickness, hypersensitivity angiitis (polyarteritis), anaphylactic shock, urticaria, arthralgia, fever, rashes (all allergic reactions require prompt and permanent withdrawal of the drug), proteinuria, hematuria, oliguria, anuria, renal failure with azotemia, glomerulonephritis, acute tubular necrosis, nephrotic syndrome, bilateral renal cortical necrosis, renal stones, ureteral obstruction with uric acid crystals due to uricosuric action of drug, impaired renal function, cardiac decompensation, hypertension, pericarditis, diffuse interstitial myocarditis with muscle necrosis, perivascular granulomata, aggravation of temporal arteritis in patients with polymyalgia rheumatica, optic neuritis, blurred vision, retinal hemorrhage, toxic amblyopia, retinal detachment, hearing loss, hyperglycemia, thyroid hyperplasia, toxic goiter, association of hyperthyroidism and hypothyroidism (causal relationship not established), agitation, confusional states, lethargy; CNS reactions associated with overdosage, including convulsions, euphoria, psychosis, depression, headaches, hallucinations, giddiness, vertigo, coma, hyperventilation, insomnia, ulcerative stomatitis, salivary gland enlargement. (B)98-146-070-G

Serious side effects do occur. Select patients carefully (particularly the elderly) and follow them closely in line with the drug's precautions, warnings, contraindications and adverse reactions.

For complete details, including dosage, please see full prescribing information.

MSMA NEWS ROUND-UP

January, 1973

PA Conference to offer 'one-stop information center'

"One-stop shopping centers" have made a big hit on the consumer scene. Now, in effect, members of the Missouri State Medical Association are being offered a "one-stop information center" — the annual Public Affairs Conference.

Scheduled Feb. 3-4, 1973, at the Ramada Inn in Jefferson City, the Conference will offer MSMA members an opportunity to find out what is going on affecting medicine in the areas of state and national legislation, the AMA, the MSMA, foundations and MMPAC. All of this at one meeting!

Also, plenty of time has been allotted for question, answers and discussion so that MSMA members can express their own opinions on matters of concern.

(See complete Conference program on Page 7)

The Woman's Auxiliary to the MSMA has scheduled its Winter Board Meeting to coincide with the Conference so physicians and their wives will have the opportunity to attend sessions of the Conference. The Auxiliary Board will meet from 10:00 a.m. to noon, Saturday, Feb. 3, at the Ramada Inn.

Hubert A. Ritter, M.D., St. Louis, Conference Chairman, says Walter T. Gunn, M.D., St. Louis, President of the MSMA, will welcome participants. Following the welcome, a panel composed of Charles P. McGinty, M.D., Cape Girardeau; E. J. Cunningham, M.D., St. Louis; Tom McMurry, M.D., Resident at the University of Missouri Medical Center; and Mr. William F. Strech, Senior Medical Student at M.U., will discuss "What Should Organized Medicine Do to Better Serve the Profession?"

Two Missouri legislators, Rep. Richard Rabbitt, D-St. Louis, Speaker of the House, and Sen. Lem Jones, R-Kansas City, will talk on issues before the General Assembly. John I. Matthews, M.D., Jefferson City, will present the MSMA outlook on state legislation.

Howard L. Cook, Jr., Washington, D. C., Assistant Director of the AMA Department of Congressional Relations, will outline bills affecting medicine currently before Congress. David B. Weihaupt, Chicago, Director of the AMA Department of Planning and Development, will explain what the AMA offers members and field questions concerning the AMA.

MMPAC had another good record in the recent election. Kenneth C. Hollweg, M.D., Kansas City, Chairman of MMPAC, will discuss the Committee and how it works.

Clement B. Grebel, M.D., St. Louis, Chairman of the Health Care Foundation of Missouri, will bring Conference participants up to date on the Foundation.

MSMA members can register for the PA Conference by clipping the attached card and mailing it to the Missouri State Medical Association, Box 1028, Jefferson City, Missouri 65101.

Room reservations should be made directly with the Ramada Inn, Jefferson City, Mo. 65101.

FDA plans curb on anti-obesity drugs, vitamins

The Food and Drug Administration recently disclosed plans to curb the prescribing of anti-obesity drugs and also proposed limits on vitamin A and vitamin D capsules.

The agency said studies show that anti-obesity drugs are seldom effective for average users and hazardous for some. Drug bulletins will be mailed to physicians and manufacturers will be ordered to revise the labelling of the medicines.

The FDA will seek to have the great majority of appetite-suppressants — those containing an amphetamine type of chemical — regulated under the Controlled Substances Act. That would provide degrees of control ranging from tight record-keeping requirements on physicians and pharmacists to production quotas on manufacturers.

Concerning vitamins, the FDA proposed limits on capsules are 10,000 international units of vitamin A and 400 of vitamin D. Those amounts have for some time been the "recommended daily allowance."

The FDA proposal gives interested parties 60 days for comment, after which the agency will issue firm regulations. Physicians, of course, could prescribe higher amounts of the vitamins for treatment of specific diseases.

W.F. Franca, M.D., former President of MSMA, dies

Wenceslaus F. Francka, M.D., of Hannibal, a surgeon and former President of the Missouri State Medical Association, died Dec. 2 at St. Mary's Health Center, Richmond Heights. Services and burial were in Hannibal.

Dr. Francka was President of the MSMA in 1957. He was also a former trustee of the St. Louis Blue Shield Plan.

Dr. Francka practiced in Hannibal after being graduated from the St. Louis University School of Medicine in 1924 until his retirement in 1959.

Survivors include his wife, Mrs. Margaret Scheer Francka of Hannibal, and two daughters, Mrs. Jerry E. Ritter, St. Louis, and Mrs. Jane Mosley, Hannibal.

Dr. Klippel appointed

Allen P. Klippel, M.D., was recently named the first Director of Emergency Medical Services for St. Louis.

Dr. Klippel, who is Chairman of the MSMA Ad Hoc Committee on Emergency Medical Services, will assume the office Jan. 1, 1973.

News Briefs

Dr. Wilson resigns from HEW

Vernon E. Wilson, M.D., recently announced he is resigning as head of the Government Health Services and Mental Health Administration of HEW to return to the University of Missouri.

Dr. Wilson was Dean and Director of the University of Missouri Medical Center-Columbia from 1959 to 1967 and served as Vice President of Academic Affairs for the University from 1968 to 1970. He also serves on the AMA Council on Medical Education.

His position at the University will be announced at a later date.

Fire destroys Osceola clinic

D. H. Giesler, M.D., and J. H. Thies, M.D., are preparing to move into a temporary clinic facility at Osceola after fire destroyed their Tri-County Clinic in late November.

Dr. Giesler said a double-wide trailer will be used for the clinic until a permanent structure is built near the Sac-Osage Hospital.

The blaze, which broke out only moments after the clinic closed, did an estimated $150,000 damage. Dr. Giesler said many medical records in the files were damaged but salvaged while others were destroyed.

Dr. Ulett is appointed

George A. Ulett, M.D., former director of the Missouri Division of Mental Health, was recently appointed chairman of psychiatry at the Missouri Institute of Psychiatry in St. Louis. The appointment was made by the University of Missouri Board of Curators.

Mental health directory ready

A resource directory listing Missouri's Public Mental Health and Mental Retardation Services has recently been published and is available free to physicians.

The directory gives the name and location of the clinics, the telephone number, the area the clinic serves and the hours the clinic is open.

Richard B. Cravens, Ph.D., Director of the Community Mental Health Program, said the agency has also compiled a catalog of films and pamphlets available to physicians.

Both the directory and the catalog can be obtained free by writing to Richard B. Cravens, Missouri Division of Mental Health, 722 Jefferson St., Jefferson City, Mo. 65101.

MSMA Council votes to distribute publication as communications aid

In an effort to improve communications between the AMA and members of the Missouri State Medical Association, the MSMA Council voted Dec. 9 to distribute copies of the weekly AMA Newsletter to hospitals throughout the state.

The Newsletter, which usually is mailed only to state association officers, is a four-page condensed publication offering news items affecting medicine. The Councilors agreed to obtain the name of a person in each hospital in the state who will be responsible for receiving and posting the Newsletter.

The project is expected to begin with the first edition of the Newsletter in January and continue on a trial basis until the Annual Session, March 29 to April 1. The project will then be assessed for effectiveness. Councilors expressed the hope that posting the Newsletter on hospital bulletin boards would provide more physicians with access to pertinent medical information.

In other action taken at the Dec. 9-10 meeting in Jefferson City, the Council:

Otolaryngology

* Accepted a request from the Missouri Ear, Nose and Throat Association, Inc., for representation on the MSMA Commission on Interspecialty Medicine.

* Approved a 1973 budget for the MSMA of $353,757, an increase of about 5 per cent over the 1972 budget.

* Appointed an Ad Hoc Committee to study the feasibility of inserting a year of primary care training in medical school curriculum.

New Headquarters Building

* Okayed the Building Committee's recommendation for funds to remodel the newly purchased building which will become Headquarters for the MSMA. Remodeling work on the building began on Dec. 14 with a projected completion date set in late spring.

* Approved in principle the efforts of the Ad Hoc Committee on Emergency Medical Services and encouraged further development of a coordinated program for these services in Missouri and also provide for regionalization of ambulances.

* Accepted recommendations of the Committee on Planning which call for (1) tabling House of Delegates Resolution No. 27 dealing with the Council Chairmanship; (2) a study to be made of the problem that strict adherence to tradition constitutes a continuing deterrent to the sustained involvement of competent and interested members of the Association; (3) advising the Communications Committee that two ways to improve communications could be to advocate short personal letters from Councilors to their District members and to maintain closer liaison with hospital staffs; (4) a legal clarification of the Council status of Immediate Past President; (5) the Health Care Foundation of Missouri to study the possibility of developing a certified hospital admission program; and (6) the Council to study feasibility of retaining management consultants to recommend possible income-producing programs for the MSMA.

New MSMA Headquarters

The Council approved funds and remodeling work began last week on the new MSMA Headquarters Building, 113 Madison St., in Jefferson City. The historic structure is located directly across the street from the Missouri Governor's Mansion and is two blocks from the State Capitol. Contractors estimate the building will be ready for occupancy in late spring of 1973.

(Please See Next Page)

Council

(Continued from Preceding Page)

* Approved a Commission on Public Affairs report which asked for endorsement for new guidelines for mobile X-ray unit chest screening as issued by the Tuberculosis and Respiratory Disease Society of St. Louis and Eastern Missouri. The TB Society has discontinued mass screening, but will continue to offer the service in problem situations such as long term care facilities and high incidence areas.

* Heard a report from the Insurance Advisory Study Committee and approved the existing group insurance programs offered by the MSMA. The Council also okayed a recommendation seeking further study in three additional insurance areas (1) term life; (2) overhead; and (3) excess major medical.

* Approved a report from the Ad Hoc Committee on Continuing Medical Education which recommends summer employment of medical students in physicians' offices and calls for the CME Committee to form a panel to study the EKG computer interpretation problem. The CME Committee plans a workshop Feb. 2-3, 1973, in Jefferson City, in conjunction with the MSMA Council and the Public Affairs Conference.

Video Tape Depositions

* Heard a report of the Joint Meeting of Medical-Legal Committees calling for a study of the use of video tape depositions from physicians for courtroom use. Also, the Council approved a recommendation that the use of pretrial screening panels for professional liability suits be re-studied.

* Approved the report of the Ad Hoc Committee on Third Party Payments and discussed a meeting that will be held in January with representatives of the Committee and of Aetna Insurance Co. The meeting will cover Aetna's prevailing fee program.

* Endorsed a Project Proposal of the Health Care Foundation of Missouri to the Missouri Regional Medical Program which seeks funding for HCFM from MoRMP for a three-year period.

Some physicians fees may be increased within freeze guidelines

Physicians who haven't increased fees since Jan. 1, 1971, may be eligible to raise them by a cumulative 5 per cent, effective Jan. 1, 1973.

Physicians are permitted to increase fees 2.5 per cent annually without seeking prior approval by the IRS, but must be prepared to justify the increase. Only higher costs incurred since Jan. 1, 1971, or since fees were last raised, whichever is later, may be passed on in the form of higher fees. Guidelines do not allow MDs to pass on increased costs that occurred prior to Jan. 1, 1971.

Physicians will not be permitted to increase fees if the additional income would raise their profit margin above the base period. Base period profit margin is defined as any two of a physician's past three fiscal years ending before Aug. 15, 1971. Profit margin is defined as the ratio of net profit, before taxes, to total revenue.

Those physicians who feel they have suffered gross inequity or serious hardship may apply for exception to the regulations by obtaining forms S-16 and S-53 from the IRS district director.

AMA members desiring assistance may call AMA's special telephone service for interpretation of Economic Stabilization Program regulations. Call (312) 527-1571, Ext. 434, and ask for Norbert Budde.

Are claims practice of commercial carriers causing you problems?

Are the practices of commercial insurance carriers presenting problems for physicians in Missouri?

This question will be taken up Jan. 11, 1973, in Jefferson City when the MSMA Commission on Medical Economics and Third Party Medicine meet with carrier representatives.

The Commission has requested MSMA members who have experienced objectionable procedures by commercial carriers to inform MSMA Headquarters, Box 1028, Jefferson City, Mo., 65101, before the Jan. 11 meeting. It would be helpful if physicians would send supportive material listing specific instances of objectionable commercial carrier claims practices.

The meeting is to assess the present situation in Missouri in regard to an AMA resolution passed at the 1972 Annual Session. The resolution calls on third parties to consult with medicine before attempting to develop and administer contracts relating to "usual, customary, and reasonable fees," emphasized the essential need for third parties to rely upon existing peer review mechanisms and made clear the unalterable opposition of the medical profession to action on the part of any third party that would encourage or promulgate litigation in the settlement of fee disputes.

Legislation Affects You!!

All MSMA Members Are Invited to Attend the MSMA 1973

Public Affairs Conference

AND

WOMAN'S AUXILIARY BOARD MEETING

February 3-4, 1973 **Ramada Inn, Jefferson City**

Legislation, both state and federal, is having more and more affect on YOU and YOUR practice. Keep abreast of the current legislative scene by attending the 1973 Public Affairs Conference.

The Conference is designed to inform Missouri physicians about the problems and issues which medicine faces today. There will be ample time for input with officials of the MSMA, AMA and legislators.

SATURDAY, FEBRUARY 3, 1973

1:00-2:00 PM Registration

2:00 PM Welcome
Walter T. Gunn, M.D.
St. Louis, President, MSMA

2:15 PM **Panel: "What Should Organized Medicine Do to Better Serve the Profession?"**
Mr. William F. Strech, Columbia, Senior Medical Student at M.U.
Tom McMurry, M.D., Columbia, Resident Missouri University Medical Center
E. J. Cunningham, M.D., St. Louis, Practicing Physician
Charles P. McGinty, M.D., Cape Girardeau, Practicing Physician
Moderator: Hubert A. Ritter, M.D., St. Louis

3:15 PM Coffee Break

3:30 PM **Legislators' Report**
Rep. Richard Rabbitt, D-St. Louis
Sen. Lem Jones, R-Kansas City

4:30 PM **"What Does AMA Do for You?"**
David B. Weihaupt
Director, AMA Department of Planning and Development

5:00 PM **Questions and Answers**
Featuring all afternoon session program participants at social hour

6:30 PM Banquet
Speaker—
Howard L. Cook, Jr.
Assistant Director, AMA Department of Congressional Relations

SUNDAY, FEBRUARY 4, 1973

7:30-9:00 AM Buffet Breakfast

9:00 AM **Auxiliary Activities**
Mrs. Keith Jones
Warrensburg
President, Woman's Auxiliary to MSMA

9:30 AM **MSMA Outlook on Legislation**
John I. Matthews, M.D.
Jefferson City
Chairman, MSMA Legislative Affairs Committee

10:00 AM **Health Care Foundation of Missouri**
Clement B. Grebel, M.D.
St. Louis
Chairman, Central Coordinating Committee
Health Care Foundation of Missouri

10:30 AM **MMPAC—Does It Work?**
Kenneth C. Hollweg, M.D.
Kansas City
Chairman, Missouri Political Action Committee

11:00 AM **Questions and Answers**
Featuring all morning session program participants

(A Registration Form Is on the Yellow Sheet of this JOURNAL*)*

MAKE YOUR ADVANCE ROOM RESERVATIONS AT THE RAMADA INN, JEFFERSON CITY, MO. 65101

Pinworm therapy is often a family affair

Contraindications: History of hypersensitivity to thiabendazole. **Warnings:** If hypersensitivity reactions occur, drug should be discontinued immediately and not resumed. Rarely, erythema multiforme has been associated with thiabendazole therapy; in severe cases (Stevens-Johnson syndrome), fatalities have occurred. Because CNS side effects may occur quite frequently, activities requiring mental alertness should be avoided. Safe use in pregnancy or lactation has not been established. **Precautions:** Ideally, supportive therapy is indicated for anemic, dehydrated, or malnourished patients prior to initiation of anthelmintic therapy. In presence of hepatic or renal dysfunction, patients should be carefully monitored. **Adverse Reactions:** Most frequently encountered are anorexia, nausea, vomiting, and dizziness. Less frequently, diarrhea, epigastric distress, pruritus, weariness, drowsiness, giddiness, and headache have occurred. Rarely, tinnitus, hyperirritability, numbness, abnormal sensation in eyes, blurring of vision, xanthopsia; hypotension, collapse; enuresis; transient rise in cephalin flocculation and SGOT; perianal rash, cholestasis and parenchymal liver damage; hyperglycemia; transient leukopeni malodor of the urine, crystalluria, hematuria; appearance of liv Ascaris in the mouth and nose. Hypersensitivity reactions

INDICATION | DOSAGE SCHEDULE

MINTEZOL® (Thiabendazole, MSD) has demonstrated effectiveness against a broad spectrum of nematode infections. Dosages are weight related. For your convenience, the information in the weight-dose chart below is included in the full prescribing information and in the 1973 edition of PDR.

The recommended maximum daily dose of MINTEZOL is 3 g (6 tablets).

MINTEZOL should be given after meals if possible. Dietary restriction, complementary medications, and cleansing enemas are not needed.

The usual dosage schedule for all conditions is two doses per day. The size of the dose is determined by the patient's weight.

Weight-dose chart:

WEIGHT (lb)	EACH DOSE (g)	TABLETS
25	0.25	½
50	0.5	1
75	0.75	1½
100	1.0	2
125	1.25	2½
150 & over	1.5	3

The regimen for each indication follows:

INDICATION	REGIMEN	COMMENTS
Pinworm disease	Two doses per day for 1 day. Repeat in 7 days. This regimen is designed to reduce the risk of reinfection.	If this is not practical, give 2 doses per day for 2 successive days.
Threadworm,* large roundworm,* hookworm,* and whipworm* disease	Two doses per day for 2 successive days.	A single dose of 20 mg/lb or 50 mg/kg may be employed as an alternative schedule, but a higher incidence of side effects should be expected.
Creeping eruption	Two doses per day for 2 successive days.	If active lesions are still present 2 days after completion of therapy, a second course is recommended.
Symptoms of trichinosis* during the invasive phase of the disease	Two doses per day for 2 to 4 successive days according to the response of the patient.	The optimal dosage for the treatment of trichinosis has not been established.

*Clinical experience with thiabendazole for treatment of each of these conditions in children weighing less than 30 lb has been limited.

Preliminary Program
115th Annual Session

MISSOURI STATE MEDICAL ASSOCIATION

Chase-Park Plaza Hotel, St. Louis **March 29-April 1, 1973**

Thursday, March 29

11:00 AM Registration of Delegates.
1:30 PM House of Delegates Meeting, opening session.
3:30 PM Reference Committee Meetings.

Friday, March 30

8:00 AM Registration.
9:00 AM General Session.
 Introduction: Walter T. Gunn, M.D., St. Louis, MSMA President.
 Speaker: Representative James W. Symington, Washington, D. C.
10:30 AM Intermission to view exhibits.
10:30 AM *Clinical Allergy—Diagnosis and Treatment.*
 Presiding: William T. K. Bryan, M.D., St. Louis, President, Missouri State Allergy Association.
 Participants:
 Welcome and Introduction, William T. K. Bryan, M.D.
 Diagnostic Tests in Allergic Disease, Raymond G. Slavin, M.D., Associate Professor of Internal Medicine and Chief, Section of Allergy and Immunology, St. Louis University School of Medicine, St. Louis.
 Hyposensitization, Ralph Hale, M.D., Department of Medicine, Wesley Medical Center and St. Joseph Hospital, Wichita, Kan.
 Food Allergy in Alcoholics, George A. Ulett, M.D., Professor and Chief, Department of Psychiatry, University of Missouri School of Medicine, St. Louis.
 Sponsored by Missouri State Allergy Association.
*11:00 AM *Newer Techniques in the Diagnosis and Treatment of Thyroid Disease.*
 Moderator: Thomas F. Frawley, M.D., St. Louis.
 Panel Participants:
 John Lindeman, M.D., St. Louis.
 Garrett Hagen, M.D., St. Louis.
 Lewis Chase, M.D., St. Louis.
 Sponsored by Missouri Society of Internal Medicine and the Missouri Chapter, American College of Physicians.
*11:00 AM *Newer Aids in the Diagnosis of Connective Tissue Disease*, John D. Arnold, M.D., Kansas City.
 Newer Treatments in Connective Tissue Disease, Jack Zuckner, M.D., St. Louis.
 Sponsored by Missouri Society of Internal Medicine and the Missouri Chapter, American College of Physicians.
*11:00 AM *Developmental Dyslexia and a Rational Approach to Management,* Norman E. Silberberg, Ph.D., Director of Research and Program Development, Kenny Rehabilitation Institute, Minneapolis, Minn.
 Moderator: Warren A. Weinberg, M.D., St. Louis.
 Panel Discussants:
 Philip R. Dodge, M.D., Professor and Chairman, Department of Pediatrics and Professor of Neurology, Washington University School of Medicine, St. Louis.
 Richard Burnett, Ed.D., Professor of Education and Director of the Reading Clinic, University of Missouri-St. Louis.
 Warren A. Weinberg, M.D., Assistant Professor, Department of Pediatrics and Neurology, Washington University School of Medicine, St. Louis.
 Manic-Depressive Illness in Children: Recognition and Treatment, Warren A. Weinberg, M.D., St. Louis.
 Sponsored by Missouri Chapter, American Academy of Pediatrics.

---

* Concurrent Sessions.

*11:00 AM *Psychiatric Sequelae of Vasectomy.*
Moderator: Ralph L. Biddy, M.D., St. Louis.
Panel Participants:
I. M. Thompson, M.D., Professor and Chief, Department of Urology, University of Missouri, Columbia.
Gilbert Ross, Jr., M.D., Department of Urology, University of Missouri, Columbia.
(Additional panelists to be announced.)
Sponsored by Missouri Psychiatric Association and Missouri Academy of Psychiatry.

*11:00 AM *Program on Surgery,* Sponsored by Missouri State Surgical Society.

12:30 PM Missouri University Alumni Luncheon.
Youth and School Committee, Missouri Chapter, American Academy of Pediatrics Luncheon. (Open to all physicians.)
Missouri Academy of Psychiatry Luncheon.

* 2:00 PM *Clinical Allergy—Diagnosis and Treatment* (Continued).
Presiding: Orval R. Withers, M.D., Clinical Professor of Medicine Emeritus, University of Kansas School of Medicine, Kansas City, Kan.
Participants:
37 Years of ENT Allergy, George E. Shambaugh, Jr., M.D., Emeritus Professor of Otolaryngology, Northwestern University School of Medicine, Chicago, Ill.
Allergic Middle Ear Disease, Jack D. Clemis, M.D., Associate Professor of Otolaryngology, Northwestern University School of Medicine, Chicago, Ill.
The Effect of Allergy on the Nervous System, Frederic Speer, M.D., Director, Pediatric Allergy, University of Kansas Medical Center, Kansas City, Kan.
Adrenergic Theory of Bronchial Asthma, Charles W. Parker, M.D., Professor of Medicine, Division of Immunology, Washington University School of Medicine, St. Louis.
Panel—Entire Faculty—Allergy—Questions and Answers.
Moderator: James W. Willoughby, M.D., Lecturer in Medicine, University of Missouri-Kansas City School of Medicine.
Sponsored by Missouri State Allergy Association.

* 2:00 PM *The Management of Chronic Renal Failure.*
Moderator: John Maher, M.D., Columbia.
Panel Participants:
Robert Cuddihee, M.D., St. Louis.
Herbert Lubowitz, M.D., St. Louis.
Thomas T. Crouch, M.D., Kansas City.
Sponsored by Missouri Society of Internal Medicine and the Missouri Chapter, American College of Physicians.

* 2:00 PM *Hypoglycemic Agents Revisited,* Marvin E. Levin, M.D., St. Louis.
(Additional program to be announced.)
Sponsored by Missouri Society of Internal Medicine and the Missouri Chapter, American College of Physicians.

* 2:00 PM *Abdominal Pain and Multiple Surgery—A Psychosomatic Condition?*
Moderator: Ralph L. Biddy, M.D., St. Louis.
Panel Participants:
David Davis, M.D., Professor of Psychiatry and Associate Chairman, Department of Psychiatry, University of Missouri School of Medicine, Columbia.
Richard T. Quick, M.D., Assistant Professor of Psychiatry, St. Louis University, St. Louis.
Richard L. Sterkel, M.D., Gastroenterologist, St. Louis.
W. E. Bazzoui, M.D., Clinical Director, Mid-Missouri Mental Health Center, Columbia.
Sponsored by Missouri Psychiatric Association and Missouri Academy of Psychiatry.

* 2:00 PM Program on Surgery Sponsored by Missouri State Surgical Society.
3:30 PM Intermission to view exhibits.
4:00 PM **House of Delegates,** second session.
5:30 PM Missouri State Medical Foundation Annual Meeting.
6:00 PM Reference Committee Meetings.
6:00 PM Dinner Meeting: Missouri State Allergy Association.
6:30 PM Dinner Meetings:
Missouri Psychiatric Association and Missouri Academy of Psychiatry.
Missouri State Surgical Society—University Club.
8:00 AM Registration.

---

* Concurrent Sessions.

Saturday, March 31

*9:00 AM *Whither Medicine.*
Moderator: Maxwell G. Berry, M.D., Kansas City.
Participants:
Assurance of Quality by Knowledge and Performance or—How Else?, Edward C. Rosenow, Jr., M.D., Executive Vice-President, American College of Physicians, Philadelphia, Pa.
Dynamic Reform in Graduate Education and Credentialing, Robert A. Chase, M.D., Chairman, Graduate Education Committee, American College of Surgeons and Emile Holman Professor of Surgery and Chairman, Department of Surgery, Stanford University School of Medicine, Stanford, Calif.
The New Economics of Health Care, William B. Hildebrand, M.D., Chairman, Council on Medical Services, American Medical Association, Menasha, Wis.

*9:00 AM *Postoperative Respiratory Care*, Henrik Bendixen, M.D., Professor and Chairman, Department of Anesthesia, University of California, San Diego, Calif.
Moderator: Robert W. Vaughan, M.D., St. Louis.
Sponsored by Missouri Society of Anesthesiologists.

10:30 AM Intermission to view exhibits.

10:30 AM *Health Care Team Concept—Spinal Cord Injury System.*
Moderator: Saul Boyarsky, M.D., St. Louis.
Participants:
Franz U. Steinberg, M.D., Chief of Physical Medicine and Rehabilitation, Jewish Hospital and Assistant Professor of Medicine, Washington University School of Medicine, St. Louis.
Simon Horenstein, M.D., Professor and Chairman, Department of Neurology, St. Louis University School of Medicine, St. Louis.
Henry G. Schwartz, M.D., Professor and Head, Division of Neurosurgery, Washington University School of Medicine, St. Louis.
Saul Boyarsky, M.D., Professor and Head of Division of Urological Surgery, Washington University School of Medicine.
(With invited discussants)

*11:00 AM *Medicine, Surgery, Anesthesia and Hepatitis*, David M. Little, Jr., M.D., Staff Anesthesiologist, Hartford Hospital, Hartford, Conn.
Moderator: Robert W. Vaughan, M.D., St. Louis.
Sponsored by Missouri Society of Anesthesiologists.

*11:00 AM *Symposium on Chemotherapy.*
Moderator: Andrew McCanse, M.D., Kansas City.
Participants:
Joel L. Zeffren, M.D., St. Louis.
Virgil Loeb, Jr., M.D., St. Louis.
Reginald P. Pugh, M.D., Columbia.
Sponsored by Missouri Division, American Cancer Society.

*11:00 AM *Newer Approaches to the Management of Coronary Artery Disease.*
Moderator: G. Charles Oliver, M.D., St. Louis.
(Panel participants to be announced.)
Sponsored by Missouri Society of Internal Medicine and the Missouri Chapter, American College of Physicians.

*11:00 AM *The Problem of Diabetic Retinopathy*, Francis A. L'Esperance, M.D., Assistant Professor of Clinical Ophthalmology, Columbia University College of Physicians and Surgeons and Director of John A. Hartford Laser Laboratory, New York, N. Y.
Moderator: Anwar Shah, M.D., St. Louis
Panel Discussants:
Isaac Boniuk, M.D., St. Louis.
King Y. Lee, M.D., Kansas City.
Anwar Shah, M.D., St. Louis.
Sponsored by the Missouri Ophthalmological Society, Inc.

12:30 PM **MSMA General Luncheon.**
Guest Speaker—James H. Sammons, M.D., Vice Chairman, Board of Trustees, American Medical Association, Baytown, Tex.
Fifty-Year Club Luncheon.
Missouri Ophthalmological Society, Inc., Luncheon.
Missouri State Society of Neurological Surgeons Luncheon.
Physiatrists Luncheon.

---

* Concurrent Sessions.

1:30 PM *Diagnostic Radiology in Obstetrics and Gynecology,* Lawrence A. Pilla, M.D., Assistant Clinical Professor of Radiology, St. Louis University, St. Louis. (This program is of general interest.)
Moderator: William H. McAlister, M.D., St. Louis.
Sponsored by Missouri Radiological Society.

* 2:30 PM *Program on Dermatology,* Sponsored by Missouri Dermatological Society, Inc.

* 2:30 PM *Cerebrovascular Disease and the Management of the Post-Phlebitic Extremity.*
Moderator: Albert M. Estes, M.D., Cape Girardeau.
Participants:
Pathogenesis and Diagnosis of Cerebral Ischemia, William S. Fields, M.D., Professor of Neurology, University of Texas Medical School, Houston, Tex.
Surgical Management of Cerebrovascular Insufficiency, Jesse E. Thompson, M.D., Clinical Professor of Surgery, University of Texas Southwestern Medical School, Dallas, Tex.
The Management of the Post-Phlebitic Extremity, Charles R. Doyle, M.D., Professor of Clinical Surgery, St. Louis University School of Medicine, St. Louis.
Sponsored by Missouri Heart Association, Inc.

* 2:30 PM *Program on Surgery,* Sponsored by Missouri State Surgical Society.

3:00 PM *Radiology of Total Hip Replacement,* Tom W. Staple, M.D., Associate Professor of Radiology, Mallinckrodt Institute of Radiology, Washington University School of Medicine, St. Louis.
A Roentgen Approach to GI Obstruction in Children, Gary D. Shackelford, M.D., Instructor in Radiology, Mallinckrodt Institute of Radiology, Washington University School of Medicine, St. Louis.
Necrotizing Enterocolitis, John C. Leonidas, M.D., Kansas City.
Moderator: William H. McAlister, M.D., St. Louis.
Sponsored by Missouri Radiological Society.

4:00 PM Intermission to view exhibits.
5:00 PM St. Louis University Medical Alumni Cocktail Party.
5:00 PM Washington University Medical Alumni Cocktail Party.
6:00 PM Missouri Dermatological Society, Inc., Cocktails and Dinner.
6:30 PM Social Hour for those Attending Banquet.
7:15 PM Annual Banquet in Honor of Past-Presidents.

Sunday, April 1

7:30 AM House of Delegates, breakfast and final session.

---

* Concurrent Sessions.

Have You Made Your Reservations?

MISSOURI STATE MEDICAL ASSOCIATION

115th ANNUAL SESSION

March 29-April 1, 1973 Chase-Park Plaza Hotel, St. Louis

AMA President Carl A. Hoffman *(left)* visits the Missouri Delegation in the Missouri Room. He is shown here with Dr. Stanley S. Peterson of Springfield, Delegate to the AMA.

MSMA Tenth District Councilor Eugene T. Hansbrough of Poplar Bluff *(left)* and MSMA Executive Secretary Raymond McIntyre, Jefferson City, discuss a matter of importance.

PSRO Is Major Issue at Clinical Convention; AMA to Take Dominant Leadership Role

The AMA will "provide a dominant role of leadership in the implementation of the PSRO program to assure that the best interests of the public and profession are preserved," the AMA House of Delegates decreed in acting on the major issue at the 1972 Clinical Convention.

This will be done by creating an advisory Committee on Professional Standards Review to help provide input from the medical profession in development of PSRO regulations and to help constituent societies set up PSROs, among other things.

On other matters, AMA President Carl A. Hoffman offered bold suggestions on solving the problems of catastrophic illness insurance coverage for Americans and the maldistribution of physicians. Delegates at the 1972 meeting gave their approval to budget restraint measures within the AMA.

During the Clinical Session in Cincinnati on November 26-29, the House of Delegates met for a total of eight hours and 55 minutes and acted upon 59 reports and 65 resolutions, the greatest total number of measures presented at a clinical meeting in several years.

More than 2,000 physicians attended the convention and included a delegation from Missouri. MSMA's four delegates, four alternates, Association officers and members were in attendance. Delegates are Arthur W. Neilson, St. Louis; Hector W. Benoit, Jr., Kansas City; Stanley S. Peterson, Springfield; and J. Loren Washburn, Versailles. Alternates are James C. Sisk, St. Louis County; Robert W. Kelley, St. Louis; Rae W. Froelich, Lebanon; and Hugh E. Stephenson, Jr., Columbia.

MSMA President Walter T. Gunn, President-Elect E. A. Stricker and Council Chairman James C. Cope were in attendance.

The issue of PSRO—Professional Standards Review Organization—was No. 1 at the convention. Before adopting Report Z of the Board of Trustees and the Council on Medical Service, a lengthy plea by one delegate that the House defer action on the Report, which he called "a complete reversal of our policy," was rejected. Report Z noted that while legislation was pending in Congress, the AMA questioned whether its emphasis on cost control might not lead to a lowering of the quality of medical care. Since it is now law, the report said, AMA should act to guard the interests of the public and the profession.

The AMA Advisory Committee on Professional Standards Review will be created by the Board of Trustees. It will include members of the Board and Council on Medical Service. In addition, the Board may invite other appropriate organizations to participate.

In his address, AMA President Hoffman offered suggestions as to how some long-decried national health problems might be solved.

In reporting on his recent European survey of health care systems, Doctor Hoffman showed a film of his interviews in England, Sweden, West Germany and the Soviet Union. "What impressed

The MSMA officers and delegates meet for a caucus in the Missouri Room each day. Alternate Delegates James C. Sisk of St. Louis County *(left)* and Rae W. Froelich of Lebanon *(right)* confer with AMA Delegate Arthur W. Neilson of St. Louis.

MSMA President Walter T. Gunn *(left)* and AMA President Hoffman enjoy a friendly get-together. All MSMA members and their wives consider the Missouri Room their "headquarters" during this and all other AMA conventions.

me most," he said, "was the fact that the health care problems of the United States also are to be found in these other nations—where economic, political and cultural conditions are so different from our own."

Although the nations he visited also grapple with maldistribution which limits access to medical care for some citizens, he said that "we in the U. S. appear to be sadly deficient in insurance coverage for catastrophic illness." He suggested that a number of conditions be specified as catastrophic, such as hemophilia, stroke, severe burns and severe injuries, and that, perhaps, certain stipulations could be made to provide coverage for unforeseen or extremely unusual situations.

As for maldistribution of doctors, Doctor Hoffman offered what he called "perhaps a revolutionary suggestion" on how to get physicians into rural areas: A "strictly voluntary" program under which needy students could get a medical education with state or federal financing, by signing an unbreakable contract to practice in needy areas for three or four years. He would have no option to repay the loan in cash.

To control the program, medical societies and licensing boards could grant temporary licenses, allowing the physician to practice only in the designated community. After the period of service was complete, the physician would get complete licensure.

Doctor Hoffman's proposals were referred to the Council on Medical Service.

A summary of the 1973 AMA budget, prepared by the Office of Finance and the Finance Committee, drew congratulations from the reference committee which studied it. Also, budget-cutting action recently taken by the Board of Trustees was approved by the House. Fiscal restraint action taken by the Board included the termination of four councils and six committees and making specialty journals available on subscription only, starting January 9. *Prism,* the AMA's new socioeconomic publication, and *JAMA* will be sent as a membership benefit.

"In considering the budget for 1973, the Board of Trustees made a determined effort to exercise fiscal restraint and to allocate our financial resources according to priority needs," the Board said in Report A. The budget summary anticipates 1973 gross revenues of just over $37 million and operating expenses of $36,322,000, leaving a projected surplus of about $800,000.

A revised version of Medicredit will be prepared for introduction in the 93rd Congress, the Board of Trustees reported to the House. The AMA is consulting with the American Dental Association, the National Association of Retail Druggists and the Pharmaceutical Manufacturers Association regarding possible inclusion of dental and drug benefits. Enrollment incentives are being studied. All state medical associations and national specialty societies have been urged to provide suggestions for the revised proposal. The House adopted and referred to the Board a resolution setting forth principles essential to physician participation in the debate on national health insurance. The House also voted to continue to support the pluralistic health care system and oppose the concept of health maintenance organizations as the exclusive or major means of providing health care.

A complete report of the Convention is printed in the December 4 issue of *American Medical News* and contains details of these and other actions taken by the House of Delegates.

'Health Care Delivery' Is Theme for Tenth District Meeting in Farmington

Approximately 60 physicians and their wives from an 18-county Southeast Missouri area attended the annual Tenth Councilor District meeting of the Missouri State Medical Association on November 19, 1972 at the Holiday Inn in Farmington.

Discussion leaders during the Tenth District meeting in Farmington included *(left to right)* Dr. Gordon M. Nunnelly, David T. Berry, Dr. Edward D. Campbell and Dr. Charles P. McGinty of Cape Girardeau. Mr. Berry is Executive Secretary of the Cape Girardeau County Medical Society.

Dr. Jay F. Tuttle *(left)*, superintendent of the Missouri State Hospital in Farmington, and Dr. T. Eugene Ruff of Poplar Bluff.

Theme of the meeting was "Health Care Delivery: The Winds of Change."

A medical education program, which began at 1:30 PM, included presentations on mental health care delivery, comprehensive health planning, medical foundations and health maintenance organizations. Walter T. Gunn, M.D., St. Louis, President of the Missouri State Medical Association, spoke on "The Best Health Care System in the World."

Other participants featured on the afternoon program were Mr. Robert Wildman, Psychologist, Vocational Rehabilitation Department, Farmington State Hospital; Robert W. Kelley, M.D., Chairman, Governor's Advisory Council on Comprehensive Health Planning; Mr. Don Whitehead, Health Planning Specialist, Missouri Department of Community Affairs; and Mr. James B. Hughes, President, Missouri Medical Service.

Eugene T. Hansbrough, M.D., Poplar Bluff, Tenth District Councilor, served as moderator for the program.

Other area physicians on the program included Edward Campbell, M.D. and Charles McGinty, M.D., both of Cape Girardeau, and George Ladyman, M.D., Poplar Bluff.

Doctor Hansbrough, Doctor Gunn and Mrs. Keith D. Jones, Warrensburg, President of the MSMA Woman's Auxiliary, were featured speakers at the 6:30 PM dinner meeting.

Members of Mineral Area Medical Society served as hosts at the meeting.

Counties in the Missouri State Medical Association Tenth District are Bollinger, Butler, Cape Girardeau, Dunklin, Iron, Madison, Mississipi, New Madrid, Pemiscot, Perry, Reynolds, Ripley, St. Francois, Ste. Genevieve, Scott, Stoddard, Washington and Wayne.

Scientific Sessions Important to Every Physician!

115th MSMA ANNUAL SESSION

March 29-April 1, 1973 St. Louis Chase-Park Plaza Hotel

J. E. STOLFI, M.D., F.A.C.P.*

Pre-Hospital Emergency Care of The Heart Attack Patient

EMERGENCY MEDICAL CARE of patients with a coronary heart attack is divided into pre-hospital and in-hospital phases. In-hospital treatment made excellent progress during the last decade, with the development of coronary care units. Pre-hospital treatment has lagged behind.

Mobile emergency rooms and coronary care vehicles deliver medical care to patients quicker and more efficiently. Equipped with monitors, shock equipment and drugs, they allow trained personnel to treat patients on the spot and en route to the hospital.

Nothing has been done to sustain life until a mobile unit arrives. Now, an attempt is being made to provide that missing but essential link. The American College of Physicians has embarked on a mass educational program on cardiopulmonary resuscitation. This prestigious society, by using the expertise of 20,000 members, hopes to implement this lifesaving training program on a nationwide basis.

Cardiopulmonary resuscitation combines mouth-to-mouth respiration and closed heart massage. The latter is accomplished by applying downward pressure on the breastbone with the palm of the hand. By squeezing it toward the backbone, the heart is compressed and blood is forced out into the general circulation. A sudden release of pressure causes the heart to suck blood back into its chambers. If repeated once a second and accompanied by blowing air into the lungs through the mouth (12 times a minute), life can be sustained for periods in excess of 30 minutes.

The knowledge gained in coronary care units, by monitoring patients for long periods, has shown that when the heart stops beating or is rendered inefficient by a rapid or irregular rhythm, it must be restored within four minutes to preserve the brain.

When cardiac arrest occurs in the street, restaurant, theater, sports stadium, golf course or home, it is difficult to provide professional care within that critical period. The number of sudden deaths due to heart attacks annually is about 350,000. To save some of them, we will have to teach, all old enough to understand, the simple but effective resuscitative procedure outlined above. By instructing a large number, help for those stricken may be at their side. Sustaining life until professional help arrives will save thousands of victims each year. The risks involved if the procedure is performed improperly include damage to ribs and bruised organs. Some people may not have a coronary. Subjecting them to resuscitative procedures will do no harm and potential for good greatly outweighs the risks involved.

The College of Physicians, in cooperation with the Heart Associations, will urge physicians to join in this national effort. Demonstrations on mannequins and movie films will be used to train the general public.

Autopsies have revealed that many people who die suddenly have no apparent heart damage. Death may have been caused by a reversible electrical disturbance in rhythm, known as fibrillation. If resuscitated, these individuals could live a normal life.

A side issue concerns legal action against those who perform the procedure improperly. Several states have enacted laws protecting individuals who perform emergency procedures. They should be adopted universally. This legal problem emphasizes the need for good instruction. Interest, cooperation and participation by all members of the medical profession, as well as the general public, is necessary for the success of this vital drive for life.

Well-equipped mobile units staffed with trained personnel are now delivering medical care in a shorter response time to the patient whose life is being sustained. The number is small but ever increasing. A cardiologist and nurse are best prepared to utilize the electrical defibrillators, monitors, rhythm-controlling medications and pain-killing drugs. However, the shortages of both precludes their use. To compensate for this, both cardiologists and anesthesiologists have, for many years, offered training programs in the specifics of treatment and ventilatory techniques. Residents, nurses, aides, attendants and even drivers can be trained to use or help in the application of the special equipment and drugs. Thump version, closed cardiac massage and the use of oxygen, after establishing open air passages, are procedures done frequently by individuals trained to treat heart disease and administer anesthesia. Using these techniques en route to the hospital completes the life sustaining chain. The hospital can be alerted by a two-way communication system and prepare to receive the patient. On arrival at the institution, the heart attack victim is transferred from the vehicle to the intensive or coronary care unit without interrupting treatment. When in the special unit, the cardiologist and the anesthesiologist take over and institute treatment which has already been proven to reduce the percentage of deaths.

---

* This article was provided by the Commission on Emergency Medical Services, American Medical Association.

The above depicts the ideal method of treating the individual whose collapse results from a coronary heart attack. It begins at the time of onset and continues through transportation and arrival at the hospital. This is designated as pre-hospital care. The procedures that take place after arrival are classified as in-hospital emergency care. Many articles are available in medical journals that describe the latter in detail and it need not be repeated here.

WASHINGTON

Congressional leaders have given national health insurance a high priority, but the new Congress convening this month may not act on it until late this year or even next year.

Senate Democratic Leader Mike Mansfield of Montana assigned the legislation "the highest priority" and expressed confidence that a national health insurance program will be approved during the next two years by the 93rd Congress.

The key congressman on this legislation, Rep. Wilbur D. Mills (D-Ark.), chairman of the House Ways and Means Committee, has described the 93rd Congress as moving "to fashion a national health insurance program which the great bulk of Americans can support."

The three major national health insurance bills before the Congress will be the Nixon Administration's proposal financed by employer-employee contributions, the American Medical Association's Medicredit plan and legislation sponsored by Sen. Edward M. Kennedy (D.-Mass.).

The Ways and Means Committee acts first on such legislation and it had been expected to take up tax reform and, possibly, pension plan legislation before national health insurance. This would have deferred national health insurance for at least several months. But the time-table has not been definitely set and Mills recently indicated that tax reform might be given a lower priority.

Another piece of legislation of major importance to the medical profession that will be before the 93rd Congress deals with health maintenance organizations (HMOs). The Senate last year approved a bill authorizing a broad HMO program and the House Health Subcommittee approved a much more limited program.

Democrats remain in control of Congress and the key congressmen on health care legislation will continue to be Mills; Kennedy, chairman of the Senate Health Subcommittee; Rep. Paul G. Rogers (D.-Fla.), chairman of the House Health Subcommittee; and Sen. Russell B. Long (D.-La.).

Both the Ways and Means Committee and the Senate Finance Committee held extensive hearings on national health insurance during the 92nd Congress, but the legislative process must start anew because all pending bills die automatically at the end of a two-year Congress.

Medicredit, slated for early introduction, is being expanded to include home care and limited dental benefits. In the 92nd Congress, Medicredit had 174 sponsors, by far the largest number for any national health insurance legislation.

Kennedy, with the support of organized labor, sponsored the most costly plan in the 92nd Congress. It also called for extensive reorganization of the nation's health care delivery system with the government having a dominant role. At this writing, he had not disclosed any details of his new bill.

He and Mills have conferred on national health legislation to see if they could agree on a program. In a recent speech, Kennedy said that Mills "and I plan to jointly introduce such legislation early next year (1973)." But Mills has not gone quite this far, at least in his public statements. Last fall, Mills said of his talks on the matter with Kennedy:

"We found wide areas of agreement. But obviously, there were key areas where we did not —particularly in the financing and administrative areas. It may be that as we continue to discuss these areas further agreement can be made. I think I will be able to convince him that reliance on the federal treasury and the federal bureaucrat is not the best way to accomplish our common objectives."

* * *

The Bureau of Narcotics and Dangerous Drugs (BNDD) has proposed restricting sales of nine barbiturates which were described as highly addictive and linked to 1,771 suicides and deaths in 17 months.

The Bureau said the barbiturates are more dangerous than heroin.

"Withdrawal from the use of these drugs can be fatal and, in many instances, withdrawal symptoms are more severe from a barbiturate habit than from heroin addiction," BNDD Director John E. Ingersoll said.

He identified the barbiturates by their generic names as amobarbital, butabarbital, cyclobarbital, heptabarbital, pentobarbital, probarbital, secobarbital, talbutal and vinbarbital. He listed only five brand-name drugs: seconal (secobarbital), tuinal (amobarbital and secobarbital), amytol (amobarbital), neumbutal (pentobarbital) and butisol (butabarbital).

The BNDD Director asked the Food and Drug Administration to place the nine barbiturates under the same controls for cocaine, morphine, codeine, methadone and amphetamine.

* * *

W. R. Barclay, M.D., assistant executive vice-president of the American Medical Association, said that the AMA reserves the right to reject drug advertising even if it conforms to Food and Drug Administration regulations.

He said the AMA had accepted the FDA's authority as to drug advertising when it was promulgated in 1968 "after determining that the regulations would provide adequate screening and, furthermore, would have the advantage of being consistently applied to all medical publications, not just AMA journals."

However, Doctor Barclay added, the AMA reserved the further right of rejection, not only as to drugs but to other products too, "if the proposed ad is judged to be in poor taste, if the layout would cause confusion with the editorial content of the journal or if the ad is for a product, service or book which is not covered by FDA regulations and which, in AMA's opinion, does not meet our standards of acceptability."

Doctor Barclay said the impact of advertising on drug prescribing, use and misuse is not known.

"No scientific data has been developed on this question, and no reliable method has been proposed to acquire such data," Doctor Barclay said. "Ads placed in scientific journals reach a well-educated, well-informed and broadly-experienced audience that has access to many sources of scientific information. Since all material in such ads has been judged by FDA to be correct and accurate, it is difficult to see how such advertisements could adversely affect prescribing practices. In spite of the plethora of information available to physicians, AMA has developed and distributed without charge to its members its own evaluation of drug products. This book is titled *AMA Drug Evaluations* and is usually referred to as 'ADE.' Unfortunately, we are in no better position to judge the impact of this book than we are to judge the impact of advertising or editorial copy in our journals."

Dr. Barclay outlined the AMA's position at a public hearing of the National Council of Churches.

Gantrisin® (sulfisoxazole) Roche® provides your patients with many important advantages:

- high urinary levels
- generally good tolerance
- high solubility at average urinary pH
- rapid absorption
- rapid renal clearance
- high plasma concentrations
- economy (average cost of therapy: less than 6½¢ per tablet)

Before prescribing, please consult complete prod
information, a summary of which follows:
Indications: Nonobstructed urinary tract infecti
(mainly cystitis, pyelitis, pyelonephritis) due to s
ceptible organisms. **Important Note:** ***In vitro*** **s**
sitivity tests not always reliable; must be coordina
with bacteriological and clinical response. A
aminobenzoic acid to follow-up culture media.
creasing frequency of resistant organisms limits u
fulness of antibacterial agents, especially in chro
and recurrent urinary infections. Maximum safe t
sulfonamide blood level, 20 mg/100 ml; meas
levels as variations may occur.
Contraindications: Hypersensitivity to sulfonamid
infants less than 2 months of age; pregnancy at te
and during the nursing period.
Warnings: Safety in pregnancy not established.
not use for group A beta-hemolytic streptococcal
fections, as sequelae (rheumatic fever, glomerulo
phritis) are not prevented. Deaths reported fr
hypersensitivity reactions, agranulocytosis, apla
anemia and other blood dyscrasias. Sore throat, fe
pallor, purpura or jaundice may be early indicati
of serious blood disorders. CBC and urinalysis w
careful microscopic examination should be perform
frequently.
Precautions: Use cautiously in patients with impai
renal or hepatic function, severe allergy or bronc
asthma. Hemolysis, frequently dose related, may
cur in glucose-6-phosphate dehydrogenase-defici
patients. Maintain adequate fluid intake to prev
crystalluria and stone formation.
Adverse Reactions: *Blood dyscrasias:* Agranulo
tosis, aplastic anemia, thrombocytopenia, leukope
hemolytic anemia, purpura, hypoprothrombinemia a
methemoglobinemia; *Allergic reactions:* Erythe
multiforme (Stevens-Johnson syndrome), generaliz
skin eruptions, epidermal necrolysis, urticaria, ser
sickness, pruritus, exfoliative dermatitis, anaphyl
toid reactions, periorbital edema, conjunctival a
scleral injection, photosensitization, arthralgia and
lergic myocarditis; *Gastrointestinal reactions:* Naus
emesis, abdominal pains, hepatitis, diarrhea, a
rexia, pancreatitis and stomatitis; *C.N.S. reactio*
Headache, peripheral neuritis, mental depressi
convulsions, ataxia, hallucinations, tinnitus, verti
and insomnia; *Miscellaneous reactions:* Drug fev
chills and toxic nephrosis with oliguria and anu
Periarteritis nodosa and L.E. phenomenon have
curred. Due to certain chemical similarities with so
goitrogens, diuretics (acetazolamide, thiazides) a
oral hypoglycemic agents, sulfonamides have caus
rare instances of goiter production, diuresis and hy
glycemia as well as thyroid malignancies in rats
lowing long-term administration. Cross-sensitiv
with these agents may exist.
Supplied: Tablets containing 0.5 Gm sulfisoxazole.

cute, recurrent or chronic **nonobstructed cystitis**

TWO BUILT-IN BENEFITS OF GANTRISIN®

sulfisoxazole/Roche®

1.

High urinary drug levels
Gantrisin quickly reaches peak antibacterial concentrations in the urine—usually in 2 to 3 hours. With the recommended dosage regimen, Gantrisin maintains these high urinary levels throughout therapy to combat such susceptible organisms as *E. coli, Klebsiella-Aerobacter, Staphylococcus aureus, Proteus mirabilis* and, less frequently, *Proteus vulgaris.*

2.

Generally good tolerance
Because of Gantrisin's high solubility and rapid excretion, therapy is relatively free of adverse reactions serious enough to require discontinuance of the drug (3.1% of 1002 patients in a recent study*). Even minor reactions are comparatively infrequent, but may include nausea, headache and vomiting. For other possible undesirable reactions, and precautions, please see summary of prescribing information on opposite page.

Notes of interest from Here . . . . and There

The Missouri State Board of Health has elected **Dr. William D. Bradshaw** of Clinton as vice-chairman. Doctor Bradshaw has been in general practice in Clinton since 1955 and is Councilor for the MSMA Sixth District. Chairman of the board is **Mr. Lester L. Cox** of Springfield.

Dr. Melvin Tess, first deputy health commissioner of the Division of Health for the City of St. Louis ended a 36-year career in public health when he retired on Dec. 20, 1972. Doctor Tess began his public health career as a school physician with the St. Louis Health Division in 1936 and received a master's degree in public health from the University of Michigan in 1940. He became assistant health commissioner in 1949 and was acting health commissioner during the four years that **Dr. J. Earl Smith** was on leave of absence.

Dr. Lynn M. Garner was honored at a dinner on Nov. 15, 1972 in Jefferson City observing his retirement from the Missouri Division of Health following 41 years of service. Secretary of State **James C. Kirkpatrick** was the speaker at the dinner. Doctor Garner compiled the longest continuous employment record in the history of the Division of Health. He joined the Division of Health on July 1, 1931. He advanced through the health agency ranks and on June 1, 1965 he was named by **Gov. Warren E. Hearnes** to be acting director of the Division of Health, a position he held until Jan. 1, 1971 when he was succeeded by the present director, Dr. **Herbert R. Domke.**

Dr. Albert M. Estes, Cape Girardeau, who pioneered the use of electrocardiographic equipment in Southeast Missouri, was cited recently by having the cardiac care unit of St. Francis Hospital and that of the hospital's future medical center named in his honor. The cardiac units will become known as Dr. Albert M. Estes Cardiac Station in recognition of his 33 years of internal medicine practice in Jackson and Cape Girardeau during which he specialized in heart care. The citation was made by **Dr. Raymond A. Ritter,** a member of the hospital's staff.

Dr. David D. Thomasson, Springfield, was named to represent the Missouri Heart Association at the annual meeting and scientific sessions of the American Heart Association in Dallas, Tex. on Nov. 19-21, 1972.—**Dr. Charles E. Lockhart,** Springfield, has been named chairman of the American Cancer Society's National Service and Rehabilitation Subcommittee on Honors. Recently elected to the ACS National Board of Directors as a medical delegate for a two-year term, Doctor Lockhart will serve on the ACS's Medical and Scientific Committee.

Dr. G. G. Robinson has retired after 31 years in the practice of medicine in Humansville. A 1933 graduate of the University of Kansas School of Medicine, he practiced in Georgia before moving to Humansville in 1941. Doctor Robinson is a former city councilman and past-president of the Chamber of Commerce.

MSMA Members Enjoy Caribbean Cruise

Sixty MSMA members and their wives and guests sailed from Miami, Fla. on Nov. 11, 1972 on the first MSMA-sponsored convention cruise to the Caribbean and participated in scientific sessions aboard the M S Boheme. The tour visited Puerto Plata, St. Thomas, San Juan and Haiti.

Medical seminars for the physicians were held aboard ship on the three full days at sea. Speakers at the various sessions included Drs. Peter G. Danis, Belmont R. Thiele, Richard F. Huck, Thomas J. Cooper and Harold K. Roberts, all of St. Louis; William D. Hoadley, John F. Bowser, Alfred D. Biggs, Jr., Gerald L. Miller and Thomas R. Hunt, all of Kansas City; Daniel L. Yancey of Springfield; and Trevor F. Watson of Columbia. The program was acceptable for 12 AAFP elective hours.

All members enjoyed swimming, sunning, skeet shooting, shuffleboard and tennis on board ship. Social activities included a gala Masquerade Party as well as welcome and farewell parties while at sea.

The success of the tour is indicated in the following excerpts from letters received by Royal O. Cooper, MSMA Assistant Executive Secretary and program director for the tour:

"The scientific portion of this trip was particularly good . . . I consider it an outstanding program. The additional rest and recreation provided a plus-value which cannot be estimated. Please convey to the Council of the MSMA my appreciation for the opportunity offered and my hope that this is the first in a long series of similar MSMA activities."—Roy W. Pearse, Jr., M.D., Nevada.

"I feel the place of meeting was idyllic and that the program content was worthwhile. The whole cruise was well organized, and we thank you for it."—John F. Bowser, M.D., Kansas City.

"The speakers' topics were well chosen and well presented. I think that the Council should give consideration to another such meeting. . . . Thanks for an enjoyable and educational experience."—James A. Hasek, Mountain Grove.

"We saw many old friends whom we had not seen in some time. The lectures were very good and the accommodations and service were excellent."—Robert V. Brennan, M.D., Kirkwood.

(Right to left) Dr. Ronald G. Shriver of Poplar Bluff, Dr. Owen W. D. Craig of St. Joseph, Mrs. Craig and Mrs. Shriver go aboard the MS Boheme at San Juan to sail on to Cap Haitien, the fourth exciting port in the one-week cruise.

MSMA members take advantage of the opportunity to attend the excellent medical seminars held on board ship.

Mrs. Gerald L. Miller, Kansas City, makes friends with two young natives in Puerto Plata, the "port of silver" on the north coast of the Dominican Republic.

SYNTHROID
T4

T_4 IS THE PREDICTABLE HORMONE BECAUSE IT LOVES PROTEIN.

SYNTHROID® (sodium levothyroxine) is pure synthetic T_4, the major circulating thyroid hormone. It is reliable to use because of its affinity for protein-binding sites in the blood. T_3 is more fickle. Sometimes it binds. Sometimes it doesn't. T_4 more *predictably* binds to protein.

RADAR
AHEAD

ALL THYROID-FUNCTION TESTS ARE USEFUL IN MONITORING SYNTHROID THERAPY

No calculations are needed, test interpretation is simple.

Any of the commonly used T_4 thyroid function tests (P.B.I., T_4 By Column, Murphy-Pattee, Free Thyroxine) are useful in monitoring patients on T_4 because they *all* measure T_4. Patients on SYNTHROID are thereby easy to monitor because their results will fall within predictable, elevated test ranges. Of course, clinical assessment is the best criterion of the thyroid status of the drug-treated patient.

HISTORICAL
MARKER

TWO GOOD REASONS WHY THE ROAD TO NORMALIZED THYROID STATUS IS SO SMOOTH FOR THE SYNTHROID PATIENT.

(1) The onset of action of T_4 is gradual. It has a long in vivo "half-life" of over six days. (Occasional missed doses or accidental double-doses are of less concern because of this factor)[1]; (2) since SYNTHROID contains only T_4, the potential for metabolic surges traceable to more potent iodides (T_3) is eliminated.

TEST	HYPOTHYROID	SYNTHROID THERAPEUTIC NORMAL
P.B.I.	Less than 4 mcg %	6-10 mcg %
T_4 By Column	Less than 3 mcg %	7-9 mcg %
T_3 (Resin)	Less than 25%	27-35%
T_3 (Red Cell)	Less than 11%	11.5-18%
Free Thyroxine	Less than 0.7 nanograms %	0.7-2.5 nanograms %
Murphy-Pattee	Less than 2.9 mcg %	4-11 mcg %

AS WITH ANY THYROID PREPARATION, CAUTIOUS OBSERVATION OF THE PATIENT DURING THE BEGINNING OF THERAPY WILL ALERT THE PHYSICIAN TO ANY UNTOWARD EFFECTS.

Side effects, when they do occur, are related to excessive dosage. Caution should be exercised in administering the drug to patients with cardiovascular disease. Read the accompanying prescribing information for additional data or write Flint Laboratories.

synthetic thyroid drugs,
HROID is the most
mical to the patient.

WHY DOES SYNTHROID COST LESS THAN SYNTHETIC DRUGS CONTAINING T_3?

Very simple. T_3 costs more to make synthetically than does T_4. So it is economically necessary for a synthetic thyroid medication containing T_3 to cost more than one containing T_4 alone. Synthetic combinations cost patients nearly 50% more than SYNTHROID[3] because the T_3 costs more to start with; also there is the additional expense of formulating a tablet containing two active ingredients.

Name

Address

City State Zip

Indications: SYNTHROID (sodium levothyroxine) is specific replacement therapy for diminished or absent thyroid function resulting from primary or secondary atrophy of the gland, congenital defect, surgery, excessive radiation, or antithyroid drugs. Indications for SYNTHROID (sodium levothyroxine) **Tablets** include myxedema, hypothyroidism without myxedema, hypothyroidism in pregnancy, pediatric and geriatric hypothyroidism, hypopituitary hypothyroidism, simple (nontoxic) goiter, and reproductive disorders associated with hypothyroidism. SYNTHROID (sodium levothyroxine) **for Injection** is indicated for intravenous use in myxedematous coma and other thyroid dysfunctions where rapid replacement of the hormone is required. The injection is also indicated for intramuscular use in cases where the oral route is suspect or contraindicated due to existing conditions or to absorption defects, and when a rapid onset of effect is not desired.

Precautions: As with other thyroid preparations, an overdosage may cause diarrhea or cramps, nervousness, tremors, tachycardia, vomiting and continued weight loss. These effects may begin after four or five days or may not become apparent for one to three weeks. Patients receiving the drug should be observed closely for signs of thyrotoxicosis. If indications of overdosage appear, discontinue medication for 2-6 days, then resume at a lower dosage level. In patients with diabetes mellitus, careful observations should be made for changes in insulin or other antidiabetic drug dosage requirements. If hypothyroidism is accompanied by adrenal insufficiency, as Addison's Disease (chronic subcortical insufficiency), Simmonds's Disease (panhypopituitarism) or Cushing's syndrome (hyperadrenalism), these dysfunctions must be corrected prior to and during SYNTHROID (sodium levothyroxine) administration. The drug should be administered with caution to patients with cardiovascular disease; development of chest pains or other aggravations of cardiovascular disease requires a reduction in dosage.

Contraindications: Thyrotoxicosis, acute myocardial infarction. **Side effects:** The effects of SYNTHROID (sodium levothyroxine) therapy are slow in being manifested. Side effects, when they do occur, are secondary to increased rates of body metabolism; sweating, heart palpitations with or without pain, leg cramps, and weight loss. Diarrhea, vomiting, and nervousness have also been observed. Myxedematous patients with heart disease have died from abrupt increases in dosage of thyroid drugs. Careful observation of the patient during the beginning of any thyroid therapy will alert the physician to any untoward effects.

In most cases with side effects, a reduction of dosage followed by a more gradual adjustment upward will result in a more accurate indication of the patient's dosage requirements without the appearance of side effects.

Dosage and Administration: The activity of a 0.1 mg. SYNTHROID (sodium levothyroxine) TABLET is equivalent to approximately one grain thyroid, U.S.P. Administer SYNTHROID tablets as a single daily dose, preferably after breakfast. In hypothyroidism without myxedema, the usual initial adult dose is 0.1 mg. daily, and may be increased by 0.1 mg. every 30 days until proper metabolic balance is attained. Clinical evaluation should be made monthly and PBI measurements about every 90 days. Final maintenance dosage will usually range from 0.2-0.4 mg. daily. In adult myxedema, starting dose should be 0.025 mg. daily. The dose may be increased to 0.05 mg. after two weeks and to 0.1 mg. at the end of a second two weeks. The daily dose may be further increased at two-month intervals by 0.1 mg. until the optimum maintenance dose is reached (0.1-1.0 mg. daily).

Supplied: Tablets: 0.025 mg., 0.05 mg., 0.1 mg., 0.15 mg., 0.2 mg., 0.3 mg., 0.5 mg., scored and color-coded, in bottles of 100, 500, and 1000. Injection: 500 mcg. lyophilized active ingredient and 10 mg. of Mannitol, N.F., in 10 ml. single-dose vial, with 5 ml. vial of Sodium Chloride Injection, U.S.P., as a diluent. SYNTHROID (sodium levothyroxine) for **Injection** may be administered intravenously utilizing 200-400 mcg. of a solution containing 100 mcg. per ml. If significant improvement is not shown the following day, a repeat injection of 100-200 mcg. may be given.

in Brief

A summary of AMA, medical & health news

American Medical Association / 535 North Dearborn Street / Chicago, Illinois 60610 / Phone (312) 527-1500 / TWX 910-221-0300

The AMA has proposed that physicians in corporate practice be granted regulatory relief to alleviate their unique problems under Phase 2 controls. The recommendation was made by the AMA Center for Health Services Research and Development in a presentation before the Health Service Industry's Subcommittee on Non-Institutional Providers. The AMA said many of the 30,000 physicians in corporate practice are being penalized through double taxation, thus creating disincentives to increase productivity. Most equitable solution would be to permit corporate physicians to increase their incomes without limit, but not to permit use of any part of this increase as cost justification for raising fees, the AMA said. The Medical Group Management Assn. presented supporting evidence. The AMA received assistance from the American Assn. of Medical Clinics in preparing testimony.

Yielding to protests by physicians, the Social Security Administration has deleted a provision that required the mark of illiterate or physically handicapped Medicare beneficiaries to be witnessed by someone not associated with the physician of record or other provider. The provision was dropped in September, 1972, after having been in effect for six months.

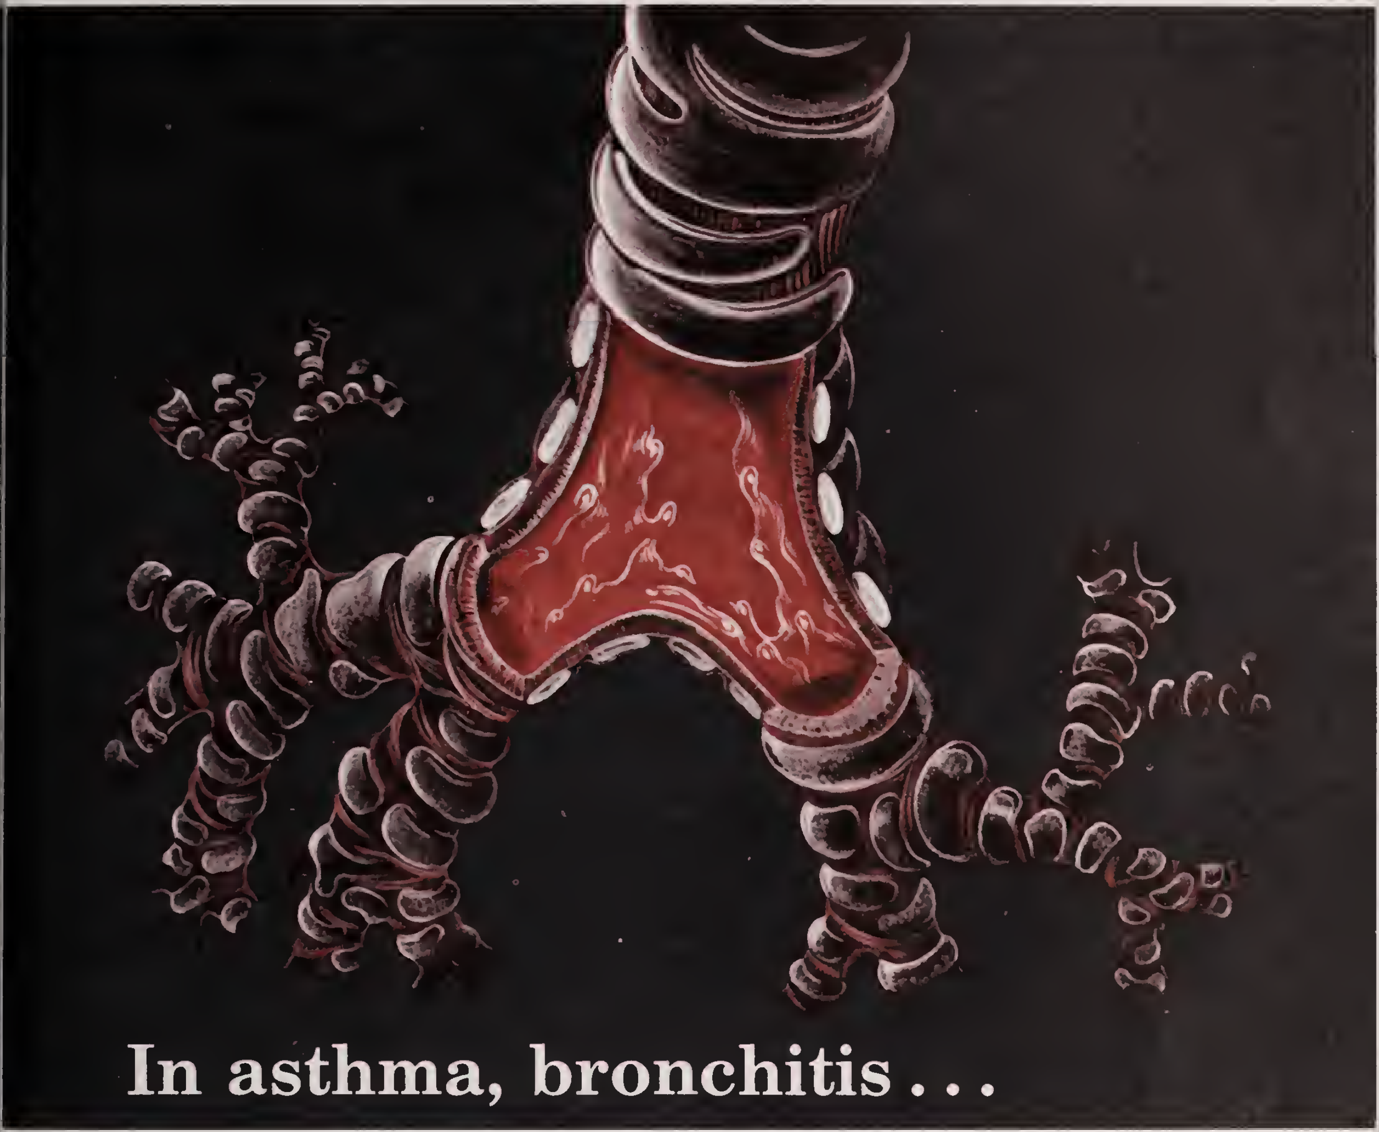
The "awful consequences" of chiropractic are described in the report of a study committee to the Wisconsin Governor's Health Planning and Policy Task Force. The committee emphasized that chiropractic treatment "frequently delays effective medical care until it is too late," often aggravates conditions, and "sometimes produces actual physical damage to patients." It outlined steps that should be taken to protect citizens against the potential hazards of chiropractic. Copies may be obtained from all medical societies.

The AMA is serving as a clearinghouse for students seeking financial assistance to help them train for careers in medicine and allied fields. The two-phase public service program, known as FIND (Financial Information National Directory), is being conducted with the full cooperation of health professions organizations, governmental agencies, schools and private organizations. More than 1,000 sources of financial aid are listed in the directory, *FIND '72-Health Careers*. Copies, $2.95 each, are available from Order Dept., AMA. The program also includes a computer search service that matches a student's needs and qualifications with current sources of funds. Write FIND, AMA, for information.

Medicine still leads all other institutions in public confidence ratings, a 1972 Harris Survey revealed. Forty-eight percent of the respondents expressed "a great deal of confidence" in the leadership of medicine, but that reflected a sharp decline from a year ago when the figure was 61%. It was 72% in 1966. Medicine previously had appeared "to be immune from the tide of disenchantment that had swept over most other leadership groups," Harris commented. Financial leaders placed second in the public esteem with a 39% "great deal of confidence" rating. Held in the lowest regard among the 16 groups covered by the survey were advertising (12%), labor (15%), television (17%) and the press (18%).

New Medicare provision for coverage of "specified chiropractic services" contains tight restrictions, HEW Undersecretary John Veneman said. Noting that the Administration is "not very supportive" of the chiropractic provision, Veneman said the most limiting restriction is that subluxation of the spine must be demonstrated by x-ray. Veneman also said review of chiropractic services will be performed exclusively by physicians in Professional Standards Review Organizations. To be eligible for Medicare reimbursement, effective July 1, 1973, a chiropractor must be licensed in his state and comply with minimum standards to be set by the HEW secretary.

MOVE-OUT STICKY MUCUS...



In asthma, bronchitis . . .

"Many physicians use iodides intravenously when they suspect that the main reason for airway obstruction is sticky mucus but oral iodides are more likely to exert an expectorant action."[1]

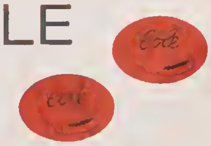
"For the viscid sputum, potassium iodide (... preferable as enteric coated tablets) may be best."[2]

Provide tastefree, well-tolerated KI in convenient SLOSOL coated tablets–

IODO-NIACIN®

COLE

Each SLOSOL coated tablet contains potassium iodide 135 mg. and niacinamide hydroiodide 25 mg.



please see next page for prescribing information–

Promote Productive Cough-

"The productive cough serves the necessary purpose of removing excess mucus from the bronchial tree."[3]

". . . there is clear evidence that the loosening of the bronchial mucus blanket must begin from within the underlying mucus glands where it is anchored and not from the surface. Complications of iodides are too occasional to avoid the use of this valuable medication."[3]

Rx Information:

INDICATIONS: The primary indication for Iodo-Niacin is in any clinical condition where iodide therapy is desired. All of the usual indications for the iodides apply to Iodo-Niacin and include:

RESPIRATORY DISEASE: The use of Iodo-Niacin is indicated whenever an expectorant action is desired to increase the flow of bronchial secretion and thin out tenacious mucus as seen in bronchial asthma, and other chronic pulmonary disease. Iodo-Niacin has also proven of value in sinusitis, bronchitis, bronchiectasis, and other chronic and acute respiratory diseases where the expectorant action of iodide is desired.

THYROID DISEASE: Iodo-Niacin is indicated in any thyroid disorder due to iodine deficiency, such as endemic goiter or hypoplastic goiter, and where hypothyroidism is secondary to iodine deficiency. Iodo-Niacin will suppress mild hyperthyroidism completely, and partially suppress more severe hyperthyroid states. Iodo-Niacin is also of value in suppressing the symptoms of hyperthyroidism and decreasing the size and vascularity of the thyroid gland prior to thyroidectomy.

ARTERIOSCLEROSIS: Iodides have been reported as relieving some of the symptoms associated with arteriosclerosis. The mechanism of action is unknown, but the effects are documented.

OPHTHALMOLOGY: Iodo-Niacin has been reported to be of value in retinal and vitreous hemorrhages. The mechanism of action is unknown, but absorption of the hemorrhagic areas has been observed following use of this drug. It is also reported to be of value in reducing or removing vitreous floaters.

SIDE EFFECTS: Serious adverse side effects from the use of Iodo-Niacin are rare. Mild symptoms of iodism such as metallic taste, skin rash, mucous membrane ulceration, salivary gland swelling, and gastric distress have occurred occasionally. These generally subside promptly when the drug is discontinued. Pulmonary tuberculosis is considered a contraindication to the use of iodides by some authorities, and the drug should be used with caution in such cases. Rare cases of goiter with hypothyroidism have been reported in adults who had taken iodides over a prolonged period of time, and in newborn infants whose mothers had taken iodides for prolonged periods. The signs and symptoms regressed spontaneously after iodides were discontinued. The causal relationship and exact mechanism of action of iodides in this phenomenon are unknown. Appropriate precautions should be followed in pregnancy and in individuals receiving Iodo-Niacin for prolonged periods.

DOSAGE: The oral dose for adults is two tablets after meals taken with a glass of water. For children over eight years, one tablet after meals with water. The dosage should be individualized according to the needs of the patient on long-term therapy.

HOW SUPPLIED: Cole's Iodo-Niacin tablets are available in bottles of 100, 500 and 1,000. Slosol coated pink. NDC 55-6458.

IODO-NIACIN®

Each SLOSOL tablet contains potassium iodide 135 mg. and niacinamide hydroiodide 25 mg. Sig. *ij* tabs. t.i.d. p.c.

and Dentistry

Obviously, many drugs are given concomitantly. Whether it makes sense to combine medications in one preparation, be it capsule, tablet, or liquid, is a question that can be answered only by examining the advantages and disadvantages in the individual case.

Among the advantages is, first of all, convenience. The more medications that are taken concurrently and the more complicated the directions, the less likely the patient is to take medications accurately. From the standpoint of convenience and accuracy, and economy as well, you can make an important case for putting medications together in one preparation, as long as they are compatible.

By the same token, when you prescribe a properly tested and rational combination, you should have less worry about pharmaceutical or pharmacological compatibility – and about reasonable dosage ratios as well. Compatibility of the formulation should be demonstrated in the laboratory and clinic before the product is available for prescription—which is more than can usually be said for the physician's own spontaneous creations. And, the dosage ratios employed in rational precompounded combinations are designed to meet the needs of substantial numbers of "typical" patients.

There is no doubt that many "atypical" patients are to be found, and for them the prefabricated combination must be rejected. But that hardly argues for eliminating rational combinations from the market. Think, for example, of the problems that would arise if the components of widely accepted combinations, like the oral contraceptives and the diuretic-antihypertensives, always had to be prescribed, purchased and ingested separately.

One disadvantage that comes to mind is some doctors' unawareness of the ingredients a given combination contains. For example, a doctor might know that a patient is allergic to aspirin but forget that a certain analgesic mixture, which he knows only by its trade name, contains aspirin. His prescription, then, causes considerable discomfort, to say the least. This problem is a function of physician education, rather than of combination therapy as such. Improving doctors' knowledge about all medicaments they prescribe is a problem that deserves tackling on its own.

Another accusation leveled at combination drugs is that they encourage sloppiness of diagnosis and treatment. In many cases, however, a combination may prove to be the most effective choice. A good example of the usefulness of combinations appears in a recent article in the *Journal of Chronic Diseases* on the efficacy and side effects of an antihypertensive containing three ingredients, in which the track records of the combination drug and the individual ingredients were compared. Interestingly enough, whether the drugs were given individually or together, incidence and severity of side effects were the same. But blood pressure control was invariably better when the drugs were taken in one combination tablet than when they were taken separately (in "titratable" dosage) or in two or three different tablets.

Deciding which combinations constitute rational therapy obviously leads to a discussion of who is to determine which should be used and which should not. Realistically, I think combinations should be evaluated somewhat differently if they are old and established or new and untried.

In today's regulatory atmosphere, there is no possibility of a new combination being put on the market without a substantial amount of acceptable evidence in the form of controlled trials that show it to be safe and efficacious. On the other hand, I believe a different set of standards should apply to combination preparations that have been around for a long time. In other words, physician acceptance over a long period should be given some weight as evidence of the efficacy and safety of these drugs.

The FDA, however, does not seem to share this attitude. It often requires, for these older products, controlled trials that will monopolize the time of already overtired investigators and cost a grea
of money. I wish we

ke antibiotic mixtures,
source of much of the
cism generated against combinations generally. Obviously, no one should be exposed willy-nilly to the potential side effects of two or three antibiotics when only one is needed. At the same time there are cases where it is prudent to prescribe more than one. The clinician is the judge in these circumstances, as he should be.

There is no clear definition of the word rational. Most persons, I suppose, would find it synonymous with reasonable, but in many circumstances it may best be defined as the opinion of those in power at the moment.

Other factors govern combination therapy, not the least of which has been its broad use by practicing physicians anxious to achieve convenience in prescribing, to reduce medication error, and to save money for their patients. Combinations clearly have met the test on all three counts.

I have been impressed by studies showing that the rate of error climbs markedly with the number of medications to be taken, even with sophisticated patients. When medically justified, therefore, this factor alone supports the logic of combination therapy.

The cost argument for combinations appears to be irrefutable. In 1971, R. A. Gosselin studied the 71 combination products (excluding oral contraceptives) among the 200 most prescribed drugs. The study found that if all 71 products were discontinued, and if each ingredient in these combinations were prescribed separately, the price of medicines to patients would jump by $443.2 million on a national basis! At a time when the cost of medical care is under so much fire, it would be nonsensical to boost costs without clearly irrefutable medical reasons.

The part played by government on this question, of course, is fundamental. The FDA should play a role in determining which combinations are reasonable. That role, as defined by law and regulation, is to ensure that any medication on the market is safe and effective in line with its label claims. Certainly combinations are entitled to as much consideration as single entities—neither more nor less. So long as the addition of one drug to another does not make either less safe, or less effective, so long as they are compatible in a formulation, we have a reasonable product. It makes no sense to recommend the use of two products for certain conditions and to deny their being combined in a single form. An unhappy side effect of the problem concerns the efficacy panel discussions of many products submitted for review. The term "effective, but" has been freely interpreted to mean "ineffective" in toto, regardless of the merit of the individual drugs. This interpretation has placed numerous useful combination products in needless jeopardy.

In reading the actual reports of the review panels, it seems clear that some of the ratings were based less on scientific research and clinical observation than on the "informed" opinions of the panelists. These "informed" opinions were accepted at face value, while the "informed" opinions of others who had used the products were rejected. All of this put combination products into a sort of scientific never-never land.

It should be kept in mind by all, government as well as others involved in our health care system, that advances in therapy are seldom made in leaps and bounds but rather by small painstaking steps—and that some of these steps have resulted from research in combination drugs as well as with single entities. Given the near-infinite biologic variation in patient response, this is hardly surprising to clinicians. It should not be to regulatory agencies either.

In the end, the practicing physician is in the best position to decide if a particular combination makes sense. Such a decision should not be made exclusively by those whose responsibility for continuing clinical care is limited. Clinicians are the best judges of efficacy because the ultimate proof of any product's effectiveness is acceptance by physicians who have observed its actions in patients over time. The corollary statement may be made about over-the-counter medicines, which would not long survive if they failed to afford the relief the user anticipates. That the antihistamine in a "cold" remedy may not *always* be necessary is no reason to proscribe the combination generally.

Cutaneous Effects of Cold Exposure

Severe injury due to freezing has almost been eliminated by the warm homes, heated cars and modern clothing of present day Americans. However, minor disorders due to cold are still very common, for example, chapping, asteatotic eczema, livedo of the legs or transient vasospasm in the hands. Diseases aggravated by cold include dysproteinemias, ichthyosis, atopic dermatitis, psoriasis of the feet and fingers, diabetic dermatopathy and circulatory deficiency generally. Studies concerning the biology of cold injury have been advanced by medical interest in freeze-preservation of skin, and this new information is summarized in this article. The most common clinical disorders are described and the current treatment summarized.

Biological Changes

Generally, the first results of cold exposure are to depress enzyme actions, dehydrate cells and concentrate intracellular electrolytes. The secondary effects of cold on the vascular supply are increased blood viscosity, vasoconstriction and stasis. Both actions are responsible for the anoxic necrosis of cold injury.

Direct Injury

Severe freezing of living tissue causes ice crystal formation in the extracellular space. Intracellular water is drawn into this crystal mass causing concentration of intracellular contents.[1] The low vapor pressure of cold water forces the water across the cell membrane as does the osmotic gradient.[2] Further, the increasing extracellular ice mechanically compresses water from the cells.[2] These forces cause severe and often fatal changes in cell functions, particularly to the cell membranes.

If cooling is very rapid and if water is unable to leave the cell rapidly, the freezing then occurs inside the cell and total disruption follows. Slow cooling results in cellular dehydration with extracellular ice formation, while rapid cooling produces intracellular ice and disintegration of the cell.[3]

The sodium-ion content of cellular fluids is crucial in the reaction to freezing. While the potassium-ion is of lesser importance than the NA^+, it nevertheless exerts its influence in much the same manner. Transition from water to ice is delayed greatly by concentrating sodium ions. Even more important, perhaps, is the effect of tissue hyper-natremia on increasing permeability of cell membranes, facilitating a protective transient dehydration of tissue. This increases intracellular sodium chloride and lowers the freezing point. In extreme cold, however, both salt and water crystallize to destroy the living tissues, but at this point, the full range of protective responses has been exhausted.

Dehydration and electrolyte transport are the principal causes of complete or partial destruction of protein. Protein stability relies on a pH of about 7.4.

The rate of freezing influences cell survival. During slow freezing, extracellular ice forms

Although minor skin diseases due to cold affect many people during the winter season, they are often neglected. The authors describe the most common clinical disorders and summarize current treatment, including freeze-preservation of skin. The authors are from the Division of Dermatology, Department of Medicine, University of Missouri Medical Center. Doctor Anderson is Chief of the Division.

draw water slowly from the cell, while during thawing, water may return to the cell without injury to the cell membrane. Merryman[1] stressed that slow freezing is the usual clinical event. Rapid freezing of skin is practically unobtainable except by the application of liquid nitrogen or similar unusual means.

The rate of warming also is of great importance. If frozen tissue is slowly warmed, recrystallization of intracellular ice occurs and cells are less likely to survive. Therefore, cell death rate is greater in the event of rapid cooling (100 C/min) and slow warming (1-10 C/min). Several variables have been cited in freezing injury: (a) duration of cold exposure, (b) temperature of exposure, (c) rapidity of freezing and (d) rapidity of rewarming.[4]

Vascular Injury

Lapp and Jergenson,[5] in their excellent review article, describe the vascular effects of frostbite. "Freezing" or "cold injury" of tissue begins about 50 F (10 C),[6] and 23 F (–5 C) is the lowest temperature to which cells may be slowly frozen and still survive.[7] However, vasoconstriction is significant even above this temperature. For example, blood flow is reduced to 3% of normal in the arm immersed in water at 55 F (13 C) for two hours.[8]

Vasoconstriction of the dermal blood vessels is due to a direct effect of cold on the vessels as well as to the central vasoconstrictor centers of the brain responding to a cooling of the peripheral blood. At maximum vasoconstriction, the skin appears pale (at about 0 C), but at approximately 15 C all metabolism and oxygen needs are reduced so that a relative oxygen surplus occurs, causing the skin to become erythematous. A sensation of warmth or burning is felt. Low skin temperature occurs with loss of pain and touch sensation and increased skin redness.

The "hunting phenomenon" of Lewis[9] is a transient paradoxical cold induced vasodilatation associated with an increase of skin temperature and brief relief of accompanying pain. It follows vasoconstriction due to rather prolonged cold. This cycle of warming recurs several times during continued cold exposure and is due to opening and closing of arteriovenous anastomoses.

A reflex constriction of the precapillary sphincters causes A-V shunting and, also, aggravates capillary stasis. Tissue anoxia, histamine release and local vessel damage increase capillary permeability and cause edema. Thawing of tissues causes increased blood flow, hyperemia, liberation of histamine and minute thrombi, which also result in local edema. Generally, with cold stimulus, the venules constrict more than the arterioles and the arterioles dilate more upon rewarming. This also results in local edema after the restarting of arterial flow.[4]

Impaired circulation is the most important factor during the recovery phase of frostbite. When cell metabolism ceases in frozen cells, vasospasm or free histamine have no injurious effects. After thawing, vasospasm of the small vessels results in anoxia, histamine injures cells and the metabolic needs of thawing cells are denied or disrupted. Experimental evidence is clear concerning the necessity of promptly restoring circulation after cold exposure. The consequences of anoxia are well-described.[6, 10-13]

Early Sequelae of Cold Injury

Initially, there is pallor. One hour after freezing, subcutaneous edema forms, resulting in the presence of vesicles and bullae.[5] A hyperemic zone occurs at the tissue line of demarcation due to reactive vasodilation. The early edema peaks at 48 to 72 hours. Pain, burning, itching and tingling result and are associated with injury to nerves, muscles, cartilage, vessels and even bone. True thermal injury with evidence of muscle damage may occur within 15 minutes of cold injury.[14]

Skin atrophy and keratinization may occur later. The connective tissue becomes sclerotic, the elastic tissue and skin appendages may disappear and melanin accumulates in the basal layer. If severe enough, actual skin necrosis will occur. After the occurrence of necrosis and gangrene, a final line of demarcation usually occurs within 60 to 90 days.

After four months, the most common physical signs are painful feet, hyperhidrosis, skin tenderness, numbness and tingling.[15]

Late Sequelae of Cold Injury

Numerous physical changes result from severe frostbite. Those noted four years after frostbite are hyperhidrosis, chronic pain, cold feet, numbness, color changes and joint symptoms.[16] Ultimately, severe frostbite results in skin necrosis with tissue loss, hypopigmentation, thickened skin with growth disturbances and nail abnormality. Severe scarring, deformity and mutilation result from the most severe injury. Moderate frostbite results in minor changes such as erythema, vesiculation leading to hyperhidrosis, color changes and mild joint symptoms. After five to 18 years, the most usual persistent abnormalities are sensitivity to cold, color changes, hyperhidrosis, hyperkeratosis, scarring, hyperesthesia, pain or transitory numbness.

Hair and Nail Growth Changes

Nail and hair growth decreases in cold weather. In Antarctica, with living temperature at 44.6 C to 48.2 C, nail and hair growth was 60% of normal. MacLean[17] noted a hair growth of 50% with living temperature near freezing. This indicates a decreased metabolism of the body surface. Cold acclimatization indicates a requirement for lowering the body surface temperature, and the decreased hair and nail growth indicates success in cold acclimatization.

Diseases of Cold

Diseases caused by cold are dependent upon the temperature, amount of exposure, immobility, health and age of the person. The effects may range from mild erythema to gangrene. Allergic mechanisms involving abnormal plasma proteins also may contribute to the variation. The list in Fig. 1 includes diseases associated with cold followed by a few of the more uncommon clinical conditions.

Frostbite

Frostbite is the actual freezing of tissue caused by sufficient cold exposure of –2 C to –10 C.[4, 18] Contributory factors are lack of proper clothing, wind, moisture, circulatory disease, anoxia, immobility and poor general health.

The frozen tissue becomes waxy and white and numb. If frozen a short time, hyperemia follows rewarming and is associated with discomfort. A return to normal can be expected within a few hours. If freezing is prolonged, edema, vesiculation, ulceration and even gangrene may occur. Symptoms relative to damaged nerves and vessels may occur with hyperhidrosis, cold sensitivity, paraesthesia, hyperesthesia and anesthesia.

Diseases Caused By or Associated With Cold

Common Conditions
Frostbite
Asteatotic eczema and chapping
Hyperhidrosis
Livedo reticularis
Benign vasospastic conditions

Uncommon Conditions
Trenchfoot, immersion foote
Chilblain
Raynaud's disease and condition
Cold urticaria
Cold hemolysin syndrome
Cryoglobulinemia
Cryofibinogenemia
Cold agglutination syndrome
Cold erythema
Acrocyanosis
Erythrocyanosis

Fig. 1

In the past, therapy for frostbite was a gradual warming of the affected part with immersion in cool water or even rubbing with snow and ice.[4] It has been shown, however, that rapid rewarming is more effective[1] due to the beneficial effects of increased circulation and decreased exposure time.[12] This results in quickly improved circulation and maximum blood flow to the part by the direct effect of heat on the blood vessels. This is associated with less destruction of blood vessel walls, increased proliferation of endothelial cells, fewer changes in the ground substance and a reduction in the damaging effect of the increased intracellular electrolyte concentration. Less tissue destruction and gangrene occurs. Rapid thawing, however, may lead to increased edema due to an inflammatory response resulting in vesiculation, hyperemia and pain, which may be severe and require analgesics.

Slow thawing results in a marked shedding of endothelial cells into the vessel lumen with increased destruction of vessel walls and more tissue gangrene. Specifically, soaking in warm water at 104 F to 111 F (or 40 C to 44 C) for 20 minutes or more is optimal.[5] Heating should continue until skin attains a pink color or to no further color change. Higher temperature is injurious, and open fire and other dry heat should be avoided. Early use of analgesics, sedation, antihistamines, general body warmth, hot liquids, sterile care, in general, and avoidance of trauma are most important. Early surgery, even debridement, is contraindicated until at least 36 to 48 hours have elapsed. Sympathectomy may be beneficial by interrupting the vasoconstriction reflex, thereby causing increased capillary filling by closing down the AV shunts. Injection of the lumbar stellate ganglia and lumbar ganglia results in a temporary sympathectomy and should be used according to the sympathectomy above.

Low molecular weight dextran, vasodilating agents and corticosteroids have been shown to be of little value. If possible, amputation should be postponed at least 60 to 90 days so that an accurate demarcating line may be assured.

Asteatotic Eczema

Asteatotic eczema describes a skin which is erythematous, dry, wrinkled, often purpuric and fissured and which has a fine scale and a microvesicular eczema reaction, all as the result of drying. Pruritus, generalized discomfort and even pain are common. Children and the elderly are most susceptible during cold, dry weather.

The etiology is not fully determined. However, it is likely that asteatosis is due simply to decreased water content of the superficial skin layers associated with a disorganized lipid layer and reduced lipid content. Reduced lipid production in skin is seen in many children or in the elderly with prolonged illness or malnutrition or as a normal variation in some adults. Asteatosis tends to be aggravated suddenly by coolness. For example, severe pruritus may occur during undressing at night or be triggered by other brief changes in humidity or temperature. The problem tends to relapse each winter, improving promptly in the summer and usually clearing completely. It is made much worse by using soaps, detergents and any defatting solvents or by prolonged water immersion alone. To protect the skin, water must be bound to electrolytes and proteins in the stratum corneum. Extraction of electrolytes by water reduces natural protection. Increasing the bound-water in the skin cures the disorder.

The milder disorder, chapping of skin, always follows prolonged exposure to cold.[19] This injury is represented by a linear cracking and scaling of the stratum corneum and upper epidermis due to dehydration, but a sustained eczema does not evolve. Chapping is associated with a low temperature and a low dew point, but it is not related to relative humidity.[20] Acclimatization to cold is important to chapping, which appears promptly if one moves suddenly from a warm, moist region to a cool, dry area. It also is associated with too-frequent bathing, the wearing of woolens, injury by chemicals or trauma and previous disease.

Middleton[20] showed an increased extensibility of the stratum corneum of the guinea pig with increased temperature. This was not accounted for by an increased water content but probably was due to a direct effect of temperature. A low temperature results in a low extensibility of the stratum corneum and contributes to fragility and to the chapping process.

Asteatosis or chapping, also termed “winter itch,” is best treated with sufficient emollients to insure a well-hydrated skin. In the elderly, it is extremely important to fortify the skin against local injury which may allow infection. Almost all dry skin disorders can be benefitted by hydration.

Specifically, lubricants, such as eucerin, or other water-rich emulsions, such as unibase or acid mantle base, rubbed well into the skin four to six times daily will provide the required lubrication. The most common error is to apply too little ointment too seldom. A bath, adding rock salt (four cups per tub), or a tar bath or oil bath may be helpful. Sometimes an oral antihistamine such as hydroxyzine hydrochloride (Vistaril, Atarax), cyprohepladine hydrochloride (Periactin) and trimeprazine tartrate (Temaril) may be used initially to control itching.

Hyperhidrosis

The etiology of cold hyperhidrosis is largely unknown. It is undetermined if the hyperhidrosis is a cause or an effect of cold injury. The person may have been hyperhidrotic prior to frostbite and this may have been a factor in aggravating frostbite. A hyperhidrotic person is more likely to acquire frostbite.[21] Many cases of severe hyperhidrosis seeming to follow frostbite are known, and the cause is thought to be an injury to autonomic nerves.

Treatment of hyperhidrosis is generally unsatisfactory. Iontophoresis with water has been used in treating palms and soles. Systemic medications usually dry the mucosae much more than the skin. Cool environment, light clothing and ventilator shoes are helpful. Foot powder and, occasionally, antifungal preparations may be necessary.

Livedo Reticularis

A distinctive, mottled, blotchy-red discoloration of the skin of the legs is termed livedo reticularis. Often seen in healthy women and children, the disorder is due to an irregular distribution of blood through the cutaneous vessels. The appearance is accentuated by cold due to a decreased arterial blood supply with arteriolar constriction resulting in local hypoxia and associated with dilatation of venules and capillaries. Edema and hyperpigmentation may occur, but ulceration rarely occurs within the dark areas. Various terms used to describe similar patterns are cutis marmorata, livedo racemosa and livedo annularis. A family tendency exists.

Usually, the mild form persists without consequences other than that of being unsightly. The more severe form is distinguished by erosions, necrosis and greater inflammation.

The exact cause in many cases remains undetermined, but livedo also may be seen with Cushing's disease, tuberculosis, cryoglobulinemia and embolism with the various collagen diseases or after severe physical damage.

Treatment should be aimed at providing adequate skin lubrication to control drying and, also, adequate clothing and local heat to provide better superficial circulation. Diagnosis and specific treatment of underlying conditions are needed.

Benign Vasospastic Episodes and Other Mild Circulatory Problems

Transient benign vasospasm of the fingers is very common, especially in young women, but it is so mild that the problem never is brought to the physician. This mild form seems not to be linked to more serious underlying disease. During exposure to cold, a dull pain develops and the hands suddenly become unevenly ivory white, then blue, slightly swollen and, often, moist with sweat. The episode only occurs during cold exposure and typically involves only a part of the hand. It usually is fully relieved by warming the hands. These episodes may be induced for diagnosis by putting hands in ice water, but not always. In the mild form, there is seldom any residual damage or progression. These people may be said to have very mild Raynaud's phenomenon[22] and an excellent prognosis. Treatment consists of large, soft mittens rather than fashionable tight thin gloves. However, many patients should remain indoors during most cold weather, and some prefer to move south.

Summary

The treatment of those common and usually mild diseases caused by winter cold is summarized, with a review of our current knowledge of frostbite. Livedo reticularis, hyperhidrosis and the transient vasospasm disorders are not well explained in textbooks.

Direct cold damage to the cell occurs via intra- and extra-cellular ice crystal formation resulting in dehydration and drastic change in cell permeability. Other damage is the result of vascular changes, primarily vasoconstriction, leading to inadequate tissue perfusion. Both the direct cold effect and the indirect circulatory inadequacy are most important in determining the extent and type of injury.

Acute Traumatic Rupture of Major Intrathoracic Arteries in Traffic Accidents

Case Reports

In chest injuries sustained in automobile accidents, trauma to the intrathoracic great vessels is associated with the highest mortality. This paper presents a discussion of incidence of aortic rupture, etiological factors, clinical manifestations, diagnostic aids and surgical techniques involved in four cases of acute traumatic rupture of the thoracic aorta. A fifth case with false positive aortographic findings also is reported. The authors are from the Section of Thoracic and Cardiovascular Surgery, University of Missouri, where Doctor Elkadi is Assistant Professor, Doctor Almond is Professor and Chief of the Section, and Doctors Hopeman and Simmons are Associate Professors.

TRAUMA, resulting primarily from an automobile accident,[1] is now considered as the third most frequent cause of death in the United States and is preceded only by cardiovascular disease and cancer.[2] Fifty percent of the victims of fatal traffic accidents had multiple injuries, including a severe chest injury; in one half of these victims, the chest injury was the direct cause of death.[1–3]

With reference to chest injuries, trauma to the intrathoracic great vessels is associated with the highest mortality. Most of the victims die immediately due to exsanguination with only 10% to 15% surviving long enough to receive medical attention.[4–6] In the reported large series of vascular injuries during World War II,[7] the Korean War[8–11] and the Vietnam War,[12] the number of victims with injury to the intrathoracic great vessels was very small, i.e., 0.97% or 24/2471 for World War II, 1.1% or 5/453 for the Korean War and 1.1% or 11/1000 for the Vietnam War. These figures evidence the fact that most of the victims with intrathoracic great vessel injury exsanguinate shortly after trauma and before they can reach medical facilities. A similar incidence rate is noted in civilian practice. In a series of 265 penetrating and nonpenetrating chest injuries, there were four cases or 1.5% with great vessel injury.[13] Of 783 nonpenetrating chest injuries, only two cases or 0.26% had injury to the great vessels.[14] Other series, however, showed an incidence of 5% to 7%.[15, 16]

This paper reports four consecutive cases of acute traumatic rupture of the thoracic aorta seen at the University of Missouri Medical Center (UMMC) in Columbia during a one-year period from June, 1970 to June, 1971.

CASE REPORTS

The pertinent data on these patients are summarized in Table I.

Case # 1. A 58-year-old white man was involved in an automobile accident and sustained a steering wheel injury ten hours prior to admission to the University of Missouri Medical Center on June 14, 1970. Before being transferred to UMMC, the patient was seen at another hospital and his blood pressure was found to be 40 mm Hg systolic. Fluid replacement was started and the patient was sent to UMMC for further treatment. On admission, he was pale and cold. His blood pressure was 80/50 and the pulse rate was 92 beats per minute. There was a skin contusion over the left upper anterior chest wall and a fracture of the left clavicle. There also was tenderness of the left hip joint. All peripheral and neck pulses were equal without bruits. Heart sounds were loud without murmur. Chest x-ray revealed widened superior mediastinum. X-ray of the left hip joint revealed fracture of left acetabulum. Aortic rupture was suspected and retrograde aortogram was performed immediately. The aortogram showed a false aneurysm at the base of the innominate artery. In the meantime, blood and fluid replacement had been given and the blood pressure was maintained around 90/60 mm Hg.

TABLE 1

FOUR CASES OF ACUTE TRAUMATIC AORTIC RUPTURE

Case Number	*Sex & Age*	*Cause of Injury*	*Diagnosis*	*Operation*	*Type of Support*	*Outcome*
Case # 1 June 14, 1970	W M 58	Automobile accident	Laceration of aortic arch at posterior base of innominate artery	Division of innominate artery 2 cm distal to arch, repair of posterior tear, reanastomosis of innominate artery	External shunt between ascending aorta and distal innominate artery, partial clamping of arch	Recovered
Case # 2 Sept. 5, 1970	W F 17	Automobile accident	Transection of distal aortic arch just distal to left subclavian artery, and massive hemothorax and severe pulmonary contusion	Repair with graft	Left atrial-femoral bypass	Died (during operation, cardiac arrest, massive pulmonary capillary bleeding)
Case # 3 Nov. 20, 1970	W M 23	Automobile accident	Transection of descending aorta 2 cm distal to left subclavian artery	Repair with graft	Femoro-femoral bypass	Recovered
Case # 4 June 12, 1971	W M 26	Automobile accident	Avulsion of innominate artery	Bypass of lesion with aorto-innominate artery graft and suture closure of avulsion site	None (clamping of innominate artery for 15 minutes), partial clamping of arch	Recovered

Median sternotomy was performed about three hours after admission. The pump oxygenator was kept available in case cardio-pulmonary bypass should become necessary. There was a mediastinal hematoma without apparent active bleeding. The pericardium was opened and an external shunt was inserted between the proximal part of the ascending aorta and the distal part of the innominate artery. Proximal and distal control was obtained. Dissection revealed a laceration of the aortic arch at the posterior base of the innominate artery. Active bleeding during the dissection was controlled with finger compression. A partial occluding clamp was applied to the aortic arch and the innominate artery was cross-clamped. It was impossible to reach the posterior laceration for repair. The innominate artery, therefore, was divided about 2 cm distal to the arch and the proximal stump was rotated anteriorly. In this way, it was possible to perform the repair of the laceration with direct sutures followed by reanastomosis of the innominate artery stumps. The innominate artery was divided 2 cm distal to the arch instead of at the level of the laceration in order to have a better hold on the proximal stump in case the clamp had to be repositioned, which actually happened during the procedure.

Six hours after the operation, the chest had to be reopened to control bleeding from the suture line of the innominate artery. The postoperative course was otherwise uneventful except for a short transient episode of aphasia which occurred three weeks after the operation while the patient was on the orthopedic service for treatment of his fractures. Repeated aortogram showed the arch and its branches to be normal. There was, however, a small aneurysm, probably traumatic, of the left internal carotid artery at the base of the skull. As the location of the carotid aneurysm was almost inaccessible and the patient was asymptomatic, no therapeutic measures were undertaken. The patient is now without neurologic or vascular complications one year after the operation.

Case # 2. A 17-year-old white girl was admitted to UMMC on Sept. 5, 1970, approximately four hours following an automobile crash. On admission, she was conscious and had moderate respiratory distress. Blood pressure was 150/100 mm Hg in both upper extremities and 50 mm Hg systolic in both lower extremities. Pulse rate was 110 beats per minute. Carotid pulses were equal without bruits. Heart sounds were loud with a grade III/VI systolic murmur at the left sternal border in the second and

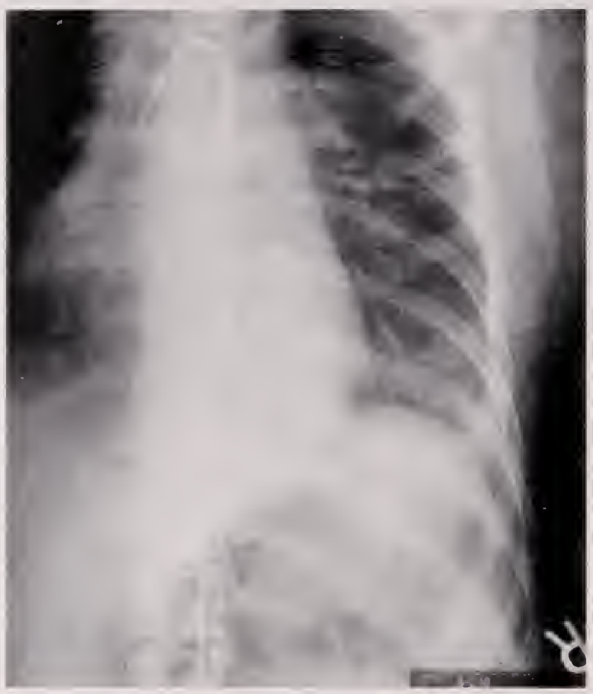

Fig. 1 Widened mediastinum (Case # 2).

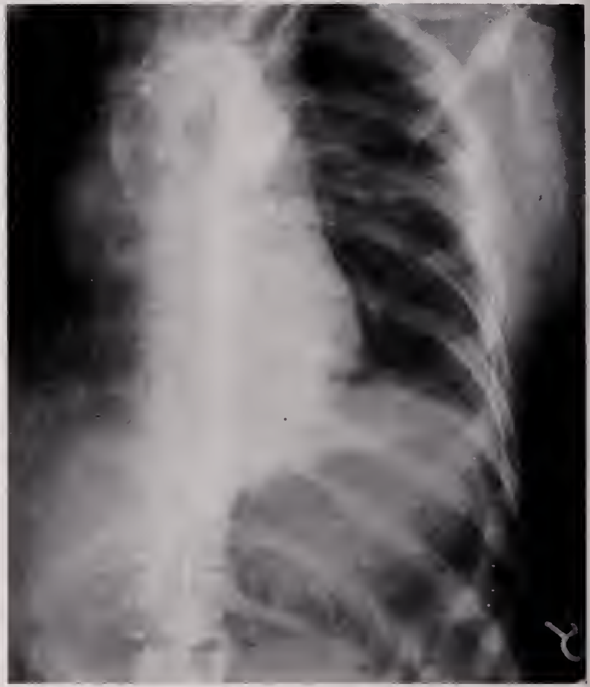

Fig. 2 Transection of aortic isthmus (Case # 2).

third intercostal spaces. The patient also had fractures of ribs, pelvis and left femur. Chest x-ray revealed widened superior mediastinum (Fig. 1). Aortography revealed transection of the aortic isthmus (Fig. 2).

Immediate left thoracotomy was performed. During induction of anesthesia, the blood pressure rose up to 200 mm Hg systolic for a few minutes and then fell to around 70 mm Hg. When the chest was opened, active bleeding from the transected aorta into the left pleural cavity was present. Bleeding was controlled and a left atrio-femoral bypass was started. Blood loss was adequately replaced. The ruptured segment was resected and replaced with a Teflon graft. During the operation, the patient developed massive pulmonary capillary bleeding, apparently due to severe pulmonary contusion. This was followed by cardiac arrest and all resuscitative measures were unsuccessful.

Case # 3. A 23-year-old white man was involved in an automobile accident 48 hours prior to admission to UMMC on Nov. 20, 1970. He sustained multiple facial fractures and bilateral malleolar fracture. Shortly after the accident, the patient was admitted to another hospital where an aortogram revealed transection of the aortic isthmus. The patient was transferred to UMMC for further treatment.

On admission, the patient was confused and irritable. Blood pressure was 120/70 and pulse rate was 100 beats per minute. All peripheral and neck pulses were equal without bruits. Heart sounds were clear. The abdomen was slightly tender and distended. The patient was taken to the operating room immediately and a left thoracotomy was performed. Simultaneously, the femoral artery and vein was exposed and cannulated for partial cardiopulmonary bypass. Exploration revealed transection of the aortic isthmus involving about 95% of the circumference. The intima and media were severed while the adventitia remained intact, preventing fatal hemorrhage. The ruptured segment was resected and replaced with a Teflon graft. The postoperative course was uneventful except for a moderate ileus, probably due to retroperitoneal hematoma, which responded well to conservative treatment. The patient returned to full normal activity.

Case # 4. A 26-year-old white man was admitted to UMMC on June 12, 1971, a few hours following an automobile crash. On admission, the patient was slightly confused and irritable with moderate respiratory distress. Blood pressure was 130/70 in the left arm and 60/40 in the right arm. All pulses of the right arm arteries were diminished. Heart sounds were loud with a systolic murmur at the upper sternal border. Chest x-ray revealed widened superior mediastinum (Fig. 3).

The aortogram revealed a false aneurysm at the base of the innominate artery with a translucent line between the aneurysm and the aortic arch (Fig. 4). Immediate median sternotomy was performed. A Teflon graft was anastomosed to the ascending aorta using a partial occluding clamp. Further dissection revealed a complete avulsion of the innominate artery with only the adventitia remaining intact and preventing fatal hemorrhage. A partial occluding clamp was applied to the aortic arch and the innominate artery was cross-clamped. The distal end of the Teflon graft was anastomosed to the distal

IMPORTANT INFORMATION: *This is a Schedule V substance by Federal law; diphenoxylate HCl is chemically related to meperidine. In case of overdosage or individual hypersensitivity, reactions similar to those after meperidine or morphine overdosage may occur; treatment is similar to that for meperidine or morphine intoxication (prolonged and careful monitoring). Respiratory depression may recur in spite of an initial response to Nalline® (nalorphine HCl) or may be evidenced as late as 30 hours after ingestion. LOMOTIL IS NOT AN INNOCUOUS DRUG AND DOSAGE RECOMMENDATIONS SHOULD BE STRICTLY ADHERED TO, ESPECIALLY IN CHILDREN THIS MEDICATION SHOULD BE KEPT OUT OF REACH OF CHILDREN.*

Indications: Lomotil is effective as adjunctive therapy in the management of diarrhea.

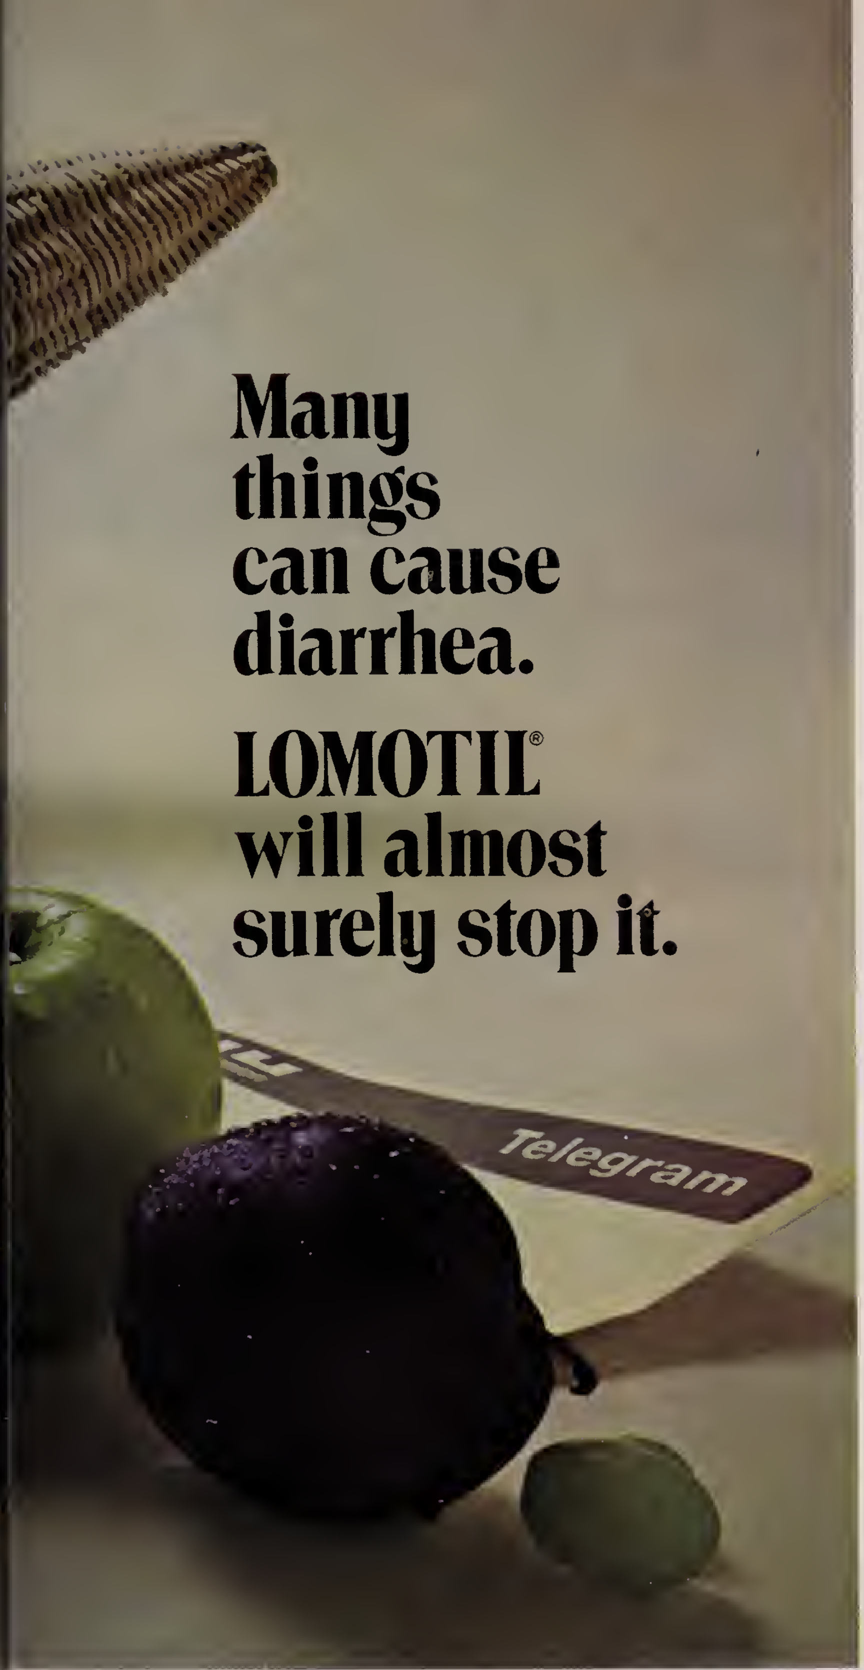
Contraindications: In children less than 2 years, due to the decreased safety margin in younger age groups, and in patients who are jaundiced or hypersensitive to diphenoxylate HCl or atropine.

Warnings: Use with caution in young children, because of variable response, and with extreme caution in patients with cirrhosis and other advanced hepatic disease or abnormal liver function tests, because of possible hepatic coma. Diphenoxylate HCl may potentiate the action of barbiturates, tranquilizers and alcohol. In theory, the concurrent use with monoamine oxidase inhibitors could precipitate hypertensive crisis.

Usage in pregnancy: Weigh the potential benefits against possible risks before using during pregnancy, lactation or in women of childbearing age. Diphenoxylate HCl and atropine are secreted in the breast milk of nursing mothers.

Precautions: Addiction (dependency) to diphen
late HCl is theoretically possible at high dosage.
not exceed recommended dosages. Administer
caution to patients receiving addicting drugs
known to be addiction prone or having a histor
drug abuse. The subtherapeutic amount of atro
is added to discourage deliberate overdosa
strictly observe contraindications, warnings and
cautions for atropine; use with caution in chil
since signs of atropinism may occur even with
recommended dosage.

Adverse reactions: Atropine effects include dry
of skin and mucous membranes, flushing and
nary retention. Other side effects with Lomotil
clude nausea, sedation, vomiting, swelling of
gums, abdominal discomfort, respiratory depress
numbness of the extremities, headache, dizzin
depression, malaise, drowsiness, coma, leth



Many things can cause diarrhea.
LOMOTIL® will almost surely stop it.
Telegram

The causes of diarrhea are as varied as man's complaints and indiscretions. Because the causes of diarrhea can be obscure and because uncontrolled diarrhea can present serious problems, it is important to know a drug that will usually stop diarrhea promptly. For many physicians, the antidiarrheal drug of choice is Lomotil. It provides almost certain control of diarrhea.

It is also useful in controlling the intestinal transit time of patients with ileostomies and colostomies and the diarrhea occurring after gastric surgery.

Serious side effects are infrequent with Lomotil. It should be used with caution in young children, however, because of their variability in response. Use of Lomotil in children under two years of age is contraindicated.

For the almost certain control of diarrhea,

LOMOTIL®

TABLETS/LIQUID

Each tablet and each 5 ml. of liquid contain:
Diphenoxylate hydrochloride ...... 2.5 mg.
(Warning: may be habit forming)
Atropine sulfate .... 0.025 mg.

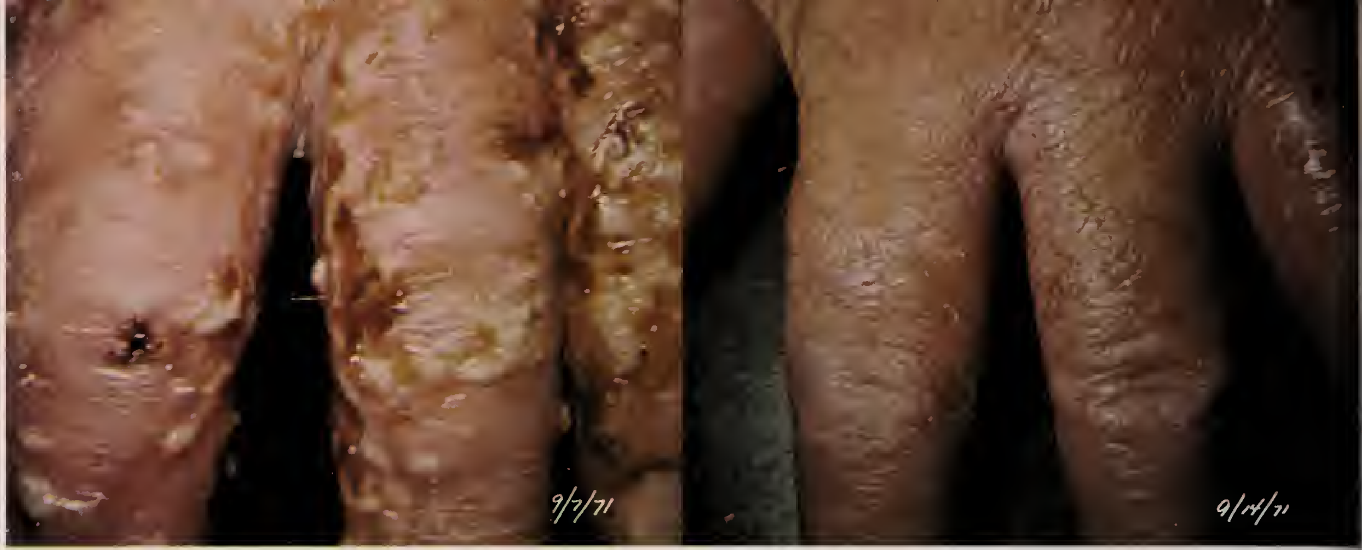
ontrolled.

dosage: Keep the medication out of the reach
ildren since accidental overdosage may cause
e, even fatal, respiratory depression. Signs of
osage include flushing, lethargy or coma, hypo-
reflexes, nystagmus, pinpoint pupils, tachy-
a and respiratory depression which may occur 12 to 30 hours after overdose. Evacuate stomach by lavage, establish a patent airway and, when necessary, assist respiration mechanically. Use a narcotic antagonist in severe respiratory depression. Observation should extend over at least 48 hours.

Dosage forms: Tablets, 2.5 mg. of diphenoxylate HCl with 0.025 mg. of atropine sulfate. *Liquid,* 2.5 mg. of diphenoxylate HCl and 0.025 mg. of atropine sulfate per 5 ml. A plastic dropper calibrated in increments of ½ ml. (total capacity, 2 ml.) accompanies each 2-oz. bottle of Lomotil liquid.

Dosage forms: Tablets, 2.5 mg. of diphenoxylate HCl with 0.025 mg. of atropine sulfate. *Liquid,* 2.5 mg. of diphenoxylate HCl and 0.025 mg. of atropine sulfate per 5 ml. A plastic dropper calibrated in increments of ½ ml. (total capacity, 2 ml.) accompanies each 2-oz. bottle of Lomotil liquid.



MINOCIN® made the difference in just eight days.*

Clinical Data:

Patient: 47-year-old male.
Diagnosis: Severe pyoderma, left hand.
Culture: *Staphylococcus aureus, coagulase* positive and sensitive to MINOCIN.
Temperature: 102° F
Therapy: MINOCIN Minocycline HCl Capsules, 100 mg: 200 mg *stat,* 100 mg every 12 hours. Medication began 9/7/71. By fourth day, temperature was normal and pustular lesions considerably improved. Last dose taken 9/14/71.
Concomitant therapy: None.†

Semisynthetic
MINOCIN®
MINOCYCLINE HCl
Capsules, 100 mg: 2 *stat,* 1 q 12 h.

Minocycline is a tetracycline with activity against a wide range of gram-negative and gram-positive organisms.
Contraindications: Hypersensitivity to any tetracycline.
Warnings: The use of tetracyclines during tooth development (last half of pregnancy, infancy and childhood to the age of 8 years) may cause permanent discoloration of the teeth (yellow-gray-brown). This is more common during long-term use but has been observed following repeated short-term courses. Enamel hypoplasia has also been reported. Tetracyclines, therefore, should not be used in this age group unless other drugs are not likely to be effective or are contraindicated. In renal impairment, usual doses may lead to excessive accumulation and liver toxicity. Under such conditions, use lower doses, and, in prolonged therapy, determine serum levels. Photosensitivity manifested by an exaggerated sunburn reaction has been observed in some individuals taking tetracyclines. Advise patients apt to be exposed to direct sunlight or ultraviolet light that such reaction can occur, and discontinue treatment at first evidence of skin erythema. Studies to date indicate that photosensitivity does not occur with MINOCIN Minocycline HCl. In patients with significantly impaired renal function, the antianabolic action of tetracycline may cause an increase in BUN, leading to azotemia, hyperphosphatemia, and acidosis. Pregnancy: In animal studies, tetracyclines cross the placenta, are found in fetal tissues, and can have toxic effects on the developing fetus (often related to retardation of skeletal development). Embryotoxicity has been noted in animals treated early in pregnancy. Safety of use during human pregnancy has not been established. *Newborns, infants and children:* All tetracyclines form a stable calcium complex in any bone-forming tissue. Prematures, given oral doses of 25 mg./kg. every 6 hours, demonstrated a decrease in fibula growth rate, reversible when drug was discontinued. Tetracyclines are present in the milk of lactating women who are taking a drug of this class. Safe use has not been established in children under 13.
Precautions: Use may result in overgrowth of nonsusceptible organisms, including fungi. If superinfection occurs, institute appropriate therapy. In venereal diseases when coexistent syphilis is suspected, darkfield examination should be done before treatment is started and blood serology repeated monthly for at least four months. Patients on anticoagulant therapy may require downward adjustment of such dosage. Test for organ system dysfunction (e.g., renal, hepatic and hemopoietic) in long-term use. Treat all Group A beta hemolytic streptococcal infections for at least 10 days. Avoid giving tetracycline in conjunction with penicillin.
Adverse Reactions: (Common to all tetracyclines, including MINOCIN) GI: (with both oral and parenteral use): anorexia, nausea, light-headedness, vomiting, diarrhea, glossitis, dysphagia, enterocolitis, inflammatory lesions (with monilial overgrowth) in anogenital region. *Skin:* maculopapular and erythematous rashes. Exfoliative dermatitis (uncommon). Photosensitivity is discussed above ("Warnings"). *Renal toxicity:* rise in BUN, dose-related (see "Warnings"). *Hypersensitivity reactions:* urticaria, angioneurotic edema, anaphylaxis, anaphylactoid purpura, pericarditis, exacerbation of systemic lupus erythematosus. When given in high doses, tetracyclines may produce brown-black microscopic discoloration of thyroid glands; no abnormalities of thyroid function studies are known to occur. In young infants, bulging fontanels have been reported following full therapeutic dosage, disappearing rapidly when drug was discontinued. *Blood:* hemolytic anemia, thrombocytopenia, neutropenia, eosinophilia.
NOTE: *Concomitant therapy:* Antacids containing aluminum, calcium, or magnesium impair absorption; do not give to patients taking oral minocycline. Studies to date indicate that MINOCIN is not notably influenced by foods and dairy products.

***Indicated in infections due to susceptible organisms. Culture and sensitivity testing recommended. Tetracyclines are not the drugs of choice in the treatment of any staphylococcal infection.**
†Case Report, Clinical Investigation Department, Lederle Laboratories

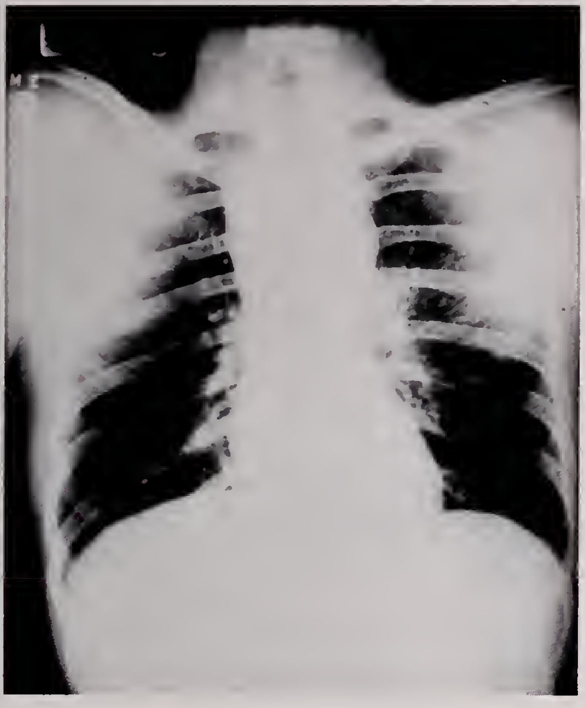

Fig. 3 Widened mediastinum (Case # 4).

part of the innominate artery. The stumps at the site of the avulsion were closed with sutures. The clamping time of the innominate artery was 15 minutes. Good back flow from the right carotid artery was present. The postoperative course was uneventful and the patient returned to full normal activity.

Case # 5. A 65-year-old white woman was admitted to UMMC on May 5, 1971, approximately ten hours following an automobile accident. On admission she was semicomatose, cold and pale, with an aramine drip which was started at another hospital. Blood pressure was 60/20 in both arms and pulse rate was 110 beats per minute with irregular cardiac rhythm. Heart sounds were clear. The abdomen was tender and distended with muscle guarding in the left hypochondrium. Chest x-ray revealed widened superior mediastinum (Fig. 5).

Aortogram was performed immediately and revealed what appeared to be laceration of the aortic isthmus (Fig. 6). The abdominal phase of the aortogram showed extravasation of contrast medium from the splenic artery (Fig. 7). EKG showed signs of acute myocardial infarction, probably due to severe myocardial contusion.

Following initial resuscitation, the patient was taken to the operating room and laparotomy was first performed. A ruptured spleen was removed and the patient was turned on her side for left thoracotomy. Exploration revealed moderate mediastinal hematoma without apparent active bleeding. Left atrio-femoral bypass was started and the aortic isthmus was dissected. Aortotomy was performed and the suspected area examined. The only abnormal

finding was a slightly elevated atheromatous plaque, which, in addition to tortuosity of the aorta, apparently contributed to the abnormal arteriographic appearance. The intimal plaque was tagged down with several sutures and the aortotomy was closed without complication. This case did not present an actual aortic rupture as was indicated by false positive arteriographic findings.

Discussion

Of the 10% to 15% who survive traumatic aortic rupture, a few patients will live long enough to develop chronic traumatic (or false) aneurysm. Survival for as long as 37 years has been reported.[6] However, most of the patients who reach the hospital resume bleeding and exsanguinate during the first few hours or days.[5] Prompt diagnosis and surgical treatment are mandatory. It must be emphasized that in 36% of patients with aortic rupture, minimal or no external evidence of injury is present.[5, 6] A history of crushing chest injury in combination with rapid deceleration should alert the physician to the possibility of aortic rupture.

The presence of massive rib fracture, especially if the first rib is involved, and the presence of a dorso-lumbar vertebral fracture in combination with a crushing or deceleration trauma should point to the possibility of aortic rupture.[5] Widened superior mediastinum on x-ray is the most common radiologic feature which should suggest aortic rupture.[5, 17–19] However, it also may be present without injury to the great vessels.[18, 19] The same applies to hemothorax or deviation of trachea to the right or both which also are found in many patients with aortic rupture.[5, 18, 19]

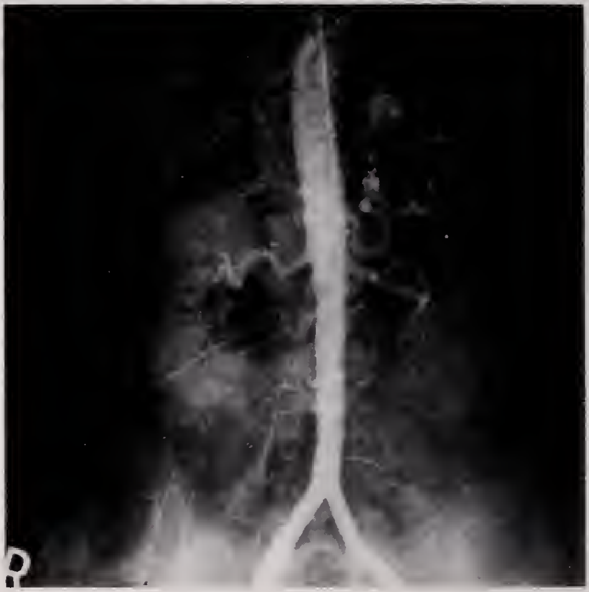

Fig. 7 Ruptured spleen (Case # 5).

The mechanical factors leading to rupture in traffic accidents are probably a combination of the impact of external force and the effect of rapid deceleration. The concept of deceleration is based on the assumption that the heart, the ascending aorta, the aortic arch and the descending thoracic aorta decelerate at different rates due to their different location and attachments. Areas subjected to greatest strain are at the points of junction of these differentially decelerated structures.[20] It was noted, however, that the impact of external force, usually associated with traffic accidents, leads to posterior displacement of the heart and proximal aortic arch with resulting flexion and elongation of the blood filled aorta. This leads to maximal strain at the convexity of the aorta proximal and distal to the arch, and it is here that most tears occur.[21] The latter mechanism was confirmed experimentally utilizing a system simulating steering wheel injury.[22]

The most common clinical manifestation is shock or evidence of blood loss. Hypertension, however, may develop during the first 24 hours following the injury in otherwise normotensive patients.[23] The combination of hypertension in the upper extremities, weak pulses in the lower extremities and the presence of a systolic murmur over the left precordium sometimes called the "coarctation syndrome," is attributed to compression of the thoracic aorta by the increasing mediastinal hematoma[24] or to aortic spasm at the site of injury.[25] This syndrome was present in Case # 2. Pain, dyspnea, dysphagia, hoarseness or signs of superior vena caval obstruction may all be caused by the increasing mediastinal dissection or compression of mediastinal structures by the developing hematoma.[26] All of the above symptoms also can be caused by other intra- and extrathoracic injuries not involving the great vessels. On the other hand, patients with aortic rupture may remain relatively asymptomatic until the traumatic aneurysm is discovered years later.

Whenever aortic rupture is suspected, immediate aortography should be performed in order to confirm the diagnosis and locate the site of rupture.[18] However, evidence of continuous massive blood loss and continuous deterioration of the patient's condition necessitates immediate surgical intervention as a part of the resuscitation without the angiographic studies.[27]

The arteriographic appearance will vary, including any of the following: slight irregularity of the aortic wall; a small filling defect due to elevation of intimal flap; visualization of a false aneurysm; visualization of the completely or incompletely transected aortic stumps with a translucent line in between.[17–19] Occasionally, extravasation of the contrast medium is seen. Although arteriography is usually accurate in establishing the diagnosis of aortic rupture, there can be false positive arteriographic findings. This was the case in Patient # 5 who did not have aortic rupture as suggested by the aortogram. Apparent irregularities of the aortic wall can be due to tortuosity of the aorta or to the presence of thick atheromatous plaques in the aortic wall. In such cases in which aortic rupture is suspected but the evidence is questionable, it is recommended to explore the aorta and, if necessary, to perform an exploratory aortotomy.

The sites of lesions in a series of 275 cases of aortic rupture with 273 of them being necropsy material, were as follows:[5] ascending aorta, 23.6%; aortic arch, 8%; aortic isthmus, 45%; descending aorta, 12.7%; abdominal aorta, 4.7%; and multiple sites, 6%. In a collective review of 110 cases undergoing surgical repair, the site of rupture was at the isthmus.[26] The explanation of different distribution is that most patients with rupture of the ascending aorta die immediately after injury, not surviving long enough to be operated on. Therefore they are not included in most surgical series. Complete transection is more common than partial tear[5, 6] and, in surviving patients, the laceration is usually limited to the intima and media while the intact adventitia prevents free hemorrhage and exsanguination.

A variety of surgical techniques was used in these reported cases; the choice of approach depended on the site and extent of the injury. When the procedure required cross-clamping of the aorta, the circulation to the distal part of the body was secured by means of partial bypass or an external shunt. Although it has been proposed that cross-clamping of the aorta for periods of less than 20 to 30 minutes was safe,[28, 29] a case of paraplegia was reported[30] after aortic cross-clamping for two periods of ten and 15 minutes. Left atrio-femoral bypass has been recommended and is still the most commonly used technique.[31, 32] Two cases of paraplegia also were reported in patients who underwent repair of aortic rupture using left atrio-femoral bypass technique.[27] Whether the paraplegia in the above-mentioned cases was due to preoperative damage caused by the primary injury remains undetermined.[27, 30]

Partial cardiopulmonary bypass using the femoro-femoral bypass technique[33] seems to have several advantages: cannulation of the patient with the bypass ready before the chest is opened, avoidance of manipulation of the heart and elimination of tubing in the operative field. Recently, more cases were reported in which external shunt without pump was used with good results.[30, 34, 35] In our reported cases, the above-mentioned techniques were applied, depending on the clinical situation and anatomical location of the lesion. Results are reported in several series with mortality ranging from 100% to zero. Table 2 shows some of the reported results.

SUMMARY

Four cases of acute traumatic rupture of the thoracic aorta following traffic accidents are reported. The site of rupture was at the aortic isthmus in two cases and at the base of the innominate artery in the others. The diagnosis was confirmed by aortogram, and surgical repair was performed immediately in all cases. One of the

Gastrocolic Fistula Secondary to Benign Gastric Ulcer

GASTROCOLIC FISTULAE from any cause are uncommon. Those arising from a benign gastric ulcer have been rarely reported. A review of recent literature revealed only 38 cases that have been described since the original recognition of this fistula as a clinical syndrome in 1755.[1-5] The rarity of the condition has prompted a review of the pertinent literature and this report of a recently encountered case.

CASE REPORT

A 33-year-old, white housewife presented herself with a one-week history of progressive nausea, vomiting and associated diarrhea. She had vomited bright blood on at least one occasion and had noted marked lethargy and weakness. During the preceding 12 months, she had experienced intermittent, burning epigastric pain, mild progressive weight loss of 15 lb and anorexia. She also had noted irregularity in her bowel habits, with some diarrhea and, on several occasions, tarry stools.

Her past history was unremarkable except for two cesarean sections. Her family history indicated that her father had died of a brain tumor five years previously.

Physical examination showed moderate dehydration and evidence of recent weight loss. She evidenced considerable tenderness over the upper abdomen and complained of some midback pain with pressure over the epigastrium.

Pertinent laboratory data indicated, on admission, a hemoglobin value of 5.9 gm/100 ml and a hematocrit reading of 19.5%. Two stool examinations were positive for traces of occult blood. Total serum protein value was 5.3 gm/100 ml with an albumin reading of 2.2 gm/100 ml. Chest x-rays revealed mild emphysematous changes. Upper gastrointestinal (GI) x-rays revealed a large fistula between the greater curvature of the stomach and the mid-transverse colon. Polypoid changes of the gastric mucosa were noted, and deformity of the distal pyloric canal was evident (Figs. 1 & 2).

It was felt that she had polypoid malignancy of the stomach with colon fistulization. Mechanical and antibacterial preparation of the colon was instituted, and whole blood and serum albumin concentrate were administered intravenously, preoperatively.

At laparotomy, a large posterior and inferior gastric ulcer with fistulization involvement of the mid-transverse colon was encountered.

En bloc subtotal gastric resection with resection

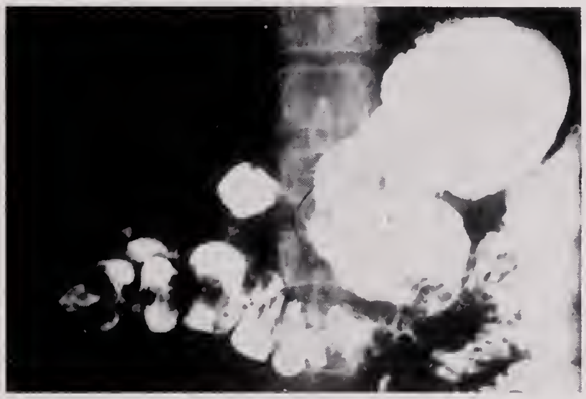

Fig. 1 Large gastrocolic fistula with prompt barium fill up of the transverse colon.

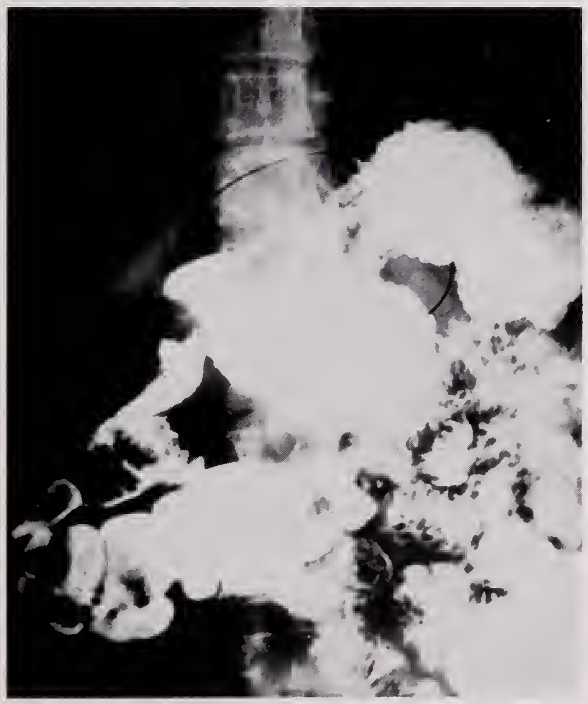

Fig. 2 Polypoid appearance of folds of stomach in area of fistula and narrowing of antral area.

This is a report of a recently encountered case of gastrocolic fistula secondary to benign gastric ulcer in a patient without previous operative procedures. The condition is uncommon. The authors review its symptomatology and management. Doctors Wooldridge and Bentlage are in the private practice of surgery.

of the mid-transverse colon was carried out. Intestinal continuity was reestablished by end-to-end colon anastomosis and an anticolic gastrojejunostomy (Fig. 3).

Pathological study revealed the gastric ulcer to measure 5 cm in diameter and to be of the peptic type. The colon fistula was surrounded by dense scarring and inflammatory reaction. No neoplastic change or colon diverticular disease was noted. Her postoperative course was uneventful and subsequent outpatient follow-up has revealed progressive weight gain and no further digestive complaints.

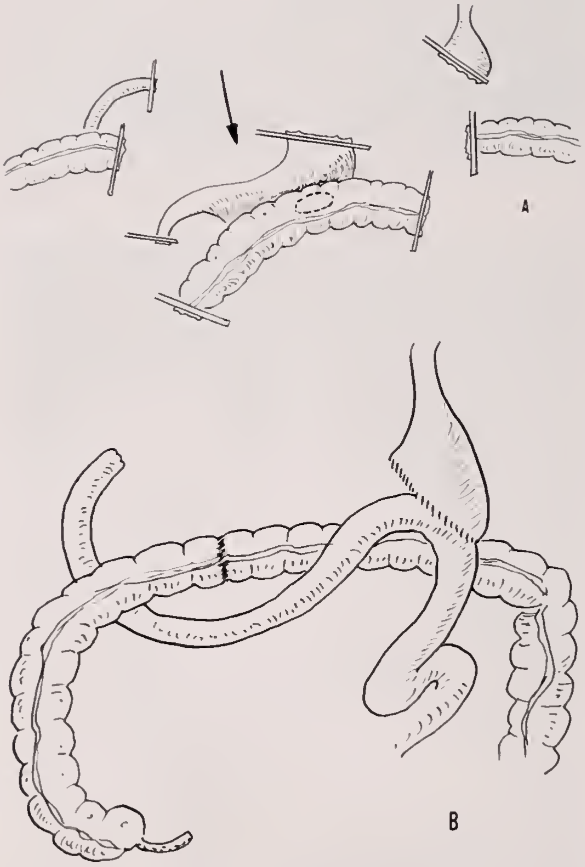

Fig. 3 Technical steps in resection of fistula. (A) Colon clamped and removed with stomach en bloc. (B) Final reconstruction. Anticolic gastrojejunostomy; Hoffmeister type.

COMMENT

Gastrocolic fistulae resulting from benign peptic ulcer disease in patients without previous operative procedures are uncommonly encountered. Neoplastic disease is reportedly the most common cause of gastrocolic fistula.[6] Marshall and Knud-Hansen[7] found that 0.5% of patients with gastric and colon carcinomas developed this complication. Other causes are rare, but include inflammatory disease (diverticulitis, ulcerative colitis, Chron's Disease, syphilis and tuberculosis),[8] other tumors of the large bowel (mostly carcinoids),[9] benign gastric ulcers and trauma.[10] One neonatal gastrocolic fistula has been reported.[11]

Of 15 reported cases of benign ulcer producing gastrocolic fistula reviewed by Fishman[2] in 1970, five were steroid induced. Dyspepsia and diarrhea were noted in all these cases, and other prominent symptoms included weight loss, abdominal pain, nausea, foul eructations and vomiting. The fistulae have been demonstrated in most all reported cases by barium enema or upper GI x-ray studies. Some radiologists feel the pressure differential in the barium enema renders this study more likely to demonstrate the fistula than the upper GI series[12] (95% accuracy as compared to 27%).

The one-stage operative procedure originally advocated by Marshall[6] for en bloc resection of the distal stomach and mid-transverse colon has been most frequently employed since 1940, as contrasted to the two-stage procedure advised by Pfeiffer and Kent[13] and by Lahey.[14] These staged procedures consisted of a preliminary colostomy proximal to the fistual area or an ileo descending colostomy followed later by definitive gastric colon resection. Present-day understanding of the pathophysiology of the disease, preoperative bowel preparation, correction of anemia and fluid and electrolyte disturbances and progress in antibiotic therapy have made the one-stage procedure feasible.

SUMMARY

A case report of gastrocolic fistula secondary to benign gastric ulcer is presented. A one-stage procedure consisting of en bloc resection of the fistula with distal subtotal gastrectomy and partial colectomy was done with favorable outcome. The pertinent literature concerning the frequen-

Appointment With Death

Attitudes and Communications

The subject of death holds a certain fascination which mixes curiosity with revulsion, sometimes fear with hesitant expectation and, although a reality, it is not always present in everyone's mind. Traditionally, this subject has been one of the major concerns of religion and its institutional representatives, whereas the preservation of life has been the prime responsibility of the physician. Indeed, death almost symbolized the failure of the physician's efforts. Schopenhauer's remark that the fear of death was the beginning of philosophy and the cause of religion probably overstated the issue. There are other mysteries in our existence which have led man to seek answers and solace in superior or supreme beings in an attempt to come to terms with problems of his existence. Man presumably is the only animal aware of his mortality. Yet, we do not dwell on this even in moments of great distress or catastrophe. We are likely to consider a person to be sick if he continually ruminates about death and entertains thoughts of dying. But, there are moments in life when the thought of death enters the awareness of the average person and fear arises within him.

Montaigne[1] said, "The end of our race is death; 'tis the necessary object of our aim which if it frights us, how is it possible to advance a step without a fit of ague? The remedy the vulgar use is not to think on't; but from what brutish stupidity can they derive so gross a blindness? . . . Let us disarm death of his novelty and strangeness, let us converse and be familiar with him and have nothing so frequent in our thoughts as death." On the other hand, Spinoza holds in his *Ethics,* "A free man thinks of death least of all things; and wisdom is a meditation not of death, but of life." Between these two poles, we can find almost any type of opinion, and nothing seems easier than to obtain quotes concerning death from the great intellects supporting one or the other attitude or, perhaps, even several at the same time. Age, stress and emotional upheaval alter ideas relating to death. We may question the statement concerning man's unique position in the animal kingdom in connection with his awareness of mortality, because nobody has ever interviewed an animal. In observing animal behavior under mortal stress, however, there is little doubt about their reactions, their fears, their attempts to escape possible destruction. After all, this is just about what man does, other than to philosophize about the impermanence of life and to attempt to ward off the inevitable.

Until not too many years ago, the subject of death and, certainly, the physician's responsibility in preparing a patient for this inevitable event was almost proscribed in medical literature. Only a few courageous teachers in medical schools dared approach the subject in lectures or conferences with medical students, and they usually limited their discussions to the simple question, "To tell or not to tell?" Even then, opinions were sharply divided and only the rare individual would go on to the question of "How to tell?"

Pertinent books and articles began to appear approximately 12 years ago and led to an avalanche of publications in the last three or four years culminating in a feature story in a popular weekly magazine, which nowadays denotes a stamp of social approval. I am not sure how this development came about except, perhaps, as a reaction to exaggerated expectations from medical progress which tended to make death less of a reality than it had been in times past. The Middle Ages, especially in 14th and 15th Century Europe, were intensely preoccupied with death as an ever-present companion, and the Apocalyptic Horsemen swept through art, literature and in their realistic form through the daily life of the populace. In stark contrast, our era has come to expect life as a right, and we have relegated death very neatly into some corner under the care of specially self-appointed minions whose major goal is to make death even look like life. We have done our very best to deny the existence of death and protect the living not only from any awareness of its inevitability, but, also, of its genuine appearance. By substituting instrumental values for institutional sanctions we have mechanized it.

The fatally ill are removed from their loved ones and their familiar environment and are forced to end their lives in the perhaps competent but exceedingly sterile and unemotional environment of a hospital. The ostensible reason, of course, is that hospitals are equipped for the support and prolongation of life while the average home is not. In our pragmatic way of thinking, such reasoning is applied without distinction or discrimination, that is, regardless of whether the patient suffers from an illness that calls for vigorous life-restoring treatment or whether treatment simply implies a few hours or a few more days of agony. Moreover, to make matters worse, the individual affected is rarely consulted concerning his or her own wishes. In short, it is simply taken for granted that everybody wants to live a little longer. American civilization takes pride in the belief that nothing is unattainable, not even the conquest of death. Strangely enough, it is far less preoccupied with the attainment of sensible, meaningful life.

Socially conscious members of the medical profession, as well as associated disciplines, began to worry about this attitude which takes biological life for granted and considers death almost as a misadventure because it placed a heavy burden on the shoulders of the responsible caretakers. As in other areas of social concern, psychiatrists became deeply involved and were expected to provide some answers although the psychiatrist encounters death far less frequently in his daily clinical activities than other physicians. Another development which brought the problem of life and death into sharper focus was the introduction of new, highly sophisticated and very expensive treatment methods which confronted the physician with the awesome dilemma of who should live and who should die. This includes the entire area of organ transplants, artificial organs, certain perfusion techniques and treatment with drugs of considerable toxicity. Finally, to complicate matters further, death itself was questioned and became a serious medical and legal as well as theological problem.

A first step toward alleviating the problem was to examine and define attitudes towards death. One may question whether they are not simply of academic concern and, perhaps, of interest to the philosopher, the historian or the theologian? Some publications seem to convey the impression that if one follows a certain prescribed course in the management of the dying patient, one is bound to relieve suffering and provide solace. This is a rather simplistic approach which fails to account for individual differences and leads to the danger of ignoring certain mores, rituals, cultural sanctions and a variety of other factors. Unless we know and respect social and cultural forces and the attitudes which they generate in the individual, we are poorly prepared to deal with the person's hopes, fears and expectations.

In general, attitudes towards death have undergone changes in recent times. However, it is not clear if this phenomenon is the result of cultural transformations or if culture reflects changes in experience of the unconscious mind. Anxiety continues to be present in everyone and is usually managed in a protective system which functions well until existence itself is threatened. Such protective systems change with time and find sanction or disapproval in the social ambient. Although the nature and meaning of anxiety have been investigated by practically all schools of psychology and philosophy with diverse results, I feel that the existentialist approach may be pertinent for the encounter with death. Tillich[2] defines the concept as follows: "The first assertion about the nature of anxiety is this: Anxiety is the state in which a being is aware of its possible nonbeing. It is not the abstract knowledge of nonbeing which produces anxiety, but the awareness that nonbeing is part of one's own being. It is not the realization of universal transitoriness, not even the experience of the death of others, but the impression of these events and the always latent awareness of our own having to die that produces anxiety."

As a general definition of anxiety, this formulation is undoubtedly insufficient and opens many questions. However, in the context of a specific discussion of death and the fear of dying, it seems to have more meaning than, for instance, Freud's concept of a death instinct. Regardless of the nature of the phenomenon of anxiety, we have to accept the fact that the thought of death generates fears, the nature of which varies from century to century, from society to society, from family to family, from one individual to the next. If death is no longer the ever-present reality that we described for the Middle Ages, we are still faced with constant reminders on different levels of awareness and sensitivity. It may be an impersonal experience, such as the death of some public figure, a natural or technological disaster, war time casualties or similar catastrophic events. It may be on an interpersonal level, such as a death of friends or close or remote acquaintances. Finally, it can be on the highly personal level, such as in the death of a member of one's family, which is most likely to generate strong feelings within us. The reaction to the latter experience will be largely conditioned by the character of the relationship and will increase in intensity if this relationship was not clearly defined and, perhaps, consisted of a mixture of love and hate. Such conflict-ridden situations provoke coping maneuvers to help conquer intolerable physiological and psychological distress. The defense mechanisms at our disposal are largely designed to deal with the emotional impact of personal experiences and memories, but we have no personal memory for death.

Death, in psychoanalytic terms, has no archaic infantile representation. Therefore, we conceive of it mostly in terms of separation, i.e., the impression created by the death of others. The French have a saying, "To leave is to die a little," which equates separation with dying. In a childlike manner, we feel that it is not we who die and leave everybody else behind, but we rather conceptualize that the others, the entire world, friends and families desert and reject us. Hence, we experience the terrors of loneliness and isolation. Life would be intolerable with such constant awareness and, therefore, we have surrounded ourselves as individuals and society with all sorts of magical stratagems. We strive to deny death by not talking about it, because this may precipitate it. We are reluctant to prepare for it, purchase "life" insurance and not "death" insurance and avoid making out wills.

On a national level, we depersonalize death with the aid of the news media. One possible exception is survivors of sudden-death situations who allegedly describe no fear at the ultimate moment but, rather, pleasurable sensations, memories etc. This may be an attempt by the Ego at mastery of the current situation. Survivors of lingering catastrophic events, on the other hand, describe initial fear which is later replaced by a feeling of invulnerability. However, relatively few persons have had such experiences and the vast majority have to fashion its own concept.

In general, mankind has tried to reduce fear of death in two ways: (1) Through emphasis on the importance of earthly life or (2) through emphasis on an afterlife. The latter attitude usually implies that certain desirable, conforming behavior in one's lifetime insures considerable rewards in the hereafter. A variation on this particular theme, of course, is the doctrine of transmigration of souls, which placed reward and punishment for one's behavior not into some ill-defined location but right here on earth, and which not only determines one's future but explains even present fate on the basis of one's behavior in a past life. The question has been posed whether religious dogma actually affects the fear of death and whether there is a difference in attitudes between a believer and a nonbeliever. Perhaps, it is not true that one is less afraid because one is a believer, but rather that one is a believer because of one's fears. Today's social climate presents serious problems for true believers unless they happen to live in an appropriate cultural environment. Otherwise, they may encounter skepticism and, perhaps, analysis of their motives.

"How to tell?" This author reviews philosophical viewpoints about dying with some examples of practical applications in clinical medicine. While he states that there is no universal formula for communication with the fatally ill, he suggests that observation of behavior and interaction with significant family members can help in selecting the most appropriate method. He attempts to bring into focus the nature of the fear of death and offers four basic rules for communication. Doctor Silberman was Associate Professor of Psychiatry at the University of Missouri School of Medicine at the time this paper was written. He is now Director of the Psychiatric Outpatient Clinic at Virginia Commonwealth University.

As already mentioned, our civilization has placed many taboos on references to death by surrounding it with euphemisms, magical attitudes, counterphobic devices and similar stratagems. Some say that we are not so much afraid of death as of dying, meaning suffering, disfigurement, loss of identity and helplessness. People may express preference for a sudden death, but also reserve judgment by adding that it is harder on the survivors. Regardless of opinions expressed in times of health, attitudes undergo remarkable changes when the individual is faced with the fact of a fatal illness. Of course, much depends on the person's customary way of dealing with stresses. But even the most poised and presumably well-adjusted individual will fall back on less rational and less mature adjustment mechanisms. Moreover, these will shift in the course of the illness, and circumspection is certainly indicated.

There is no universal recipe for communication with the fatally ill. In addition to the afflicted person, we must consider the family members as well as the personality of the physician. There is frequently a sort of family culture which governs family relations in times of stress and which may lend support to the suffering member. It also may become highly destructive, unless it is recognized as such and speedily dealt with. By this, I do not mean that we should impose our own concepts which may be quite alien and only help to confuse the issue. By closely observing behavior and interaction of significant family members, one can then select the most appropriate method for communication. Most importantly, one must watch one's language. There are terms charged with emotional meanings, such as the word "cancer" or its synonyms, which are the equivalent of a death sentence in the mind of many lay persons. The term "stroke" may be equally risky. Far more serious illnesses may be accepted with equanimity because they lack the emotional impact which socially stigmatized terms confer.

In terms of overt behavior of the patient, some observers distinguished so-called negative and positive attitudes. Among the former are listed indifference, fear, protest, contempt, envy of the living, despair, shame and stigma. Positive attitudes include courage, stoicism, heroism, surge of creativity and, occasionally, even glorification of death. Such value judgment is largely in the eye of the beholder and does not really reflect the individual's true feelings. Attitudes also do not exist in isolation, but are intertwined and undergo frequent changes related to the course of the illness, incidental experiences and environmental influences.

The feelings of the caretakers play an important part in this system of communication. Not every physician has the capacity for effective communication with the fatally ill patient. Students and young physicians have an especially tough time. They like to think of themselves as healers and often cannot tolerate the thought that all their efforts have been or will be in vain. The hospital setting itself provides little support and, indeed, may directly or indirectly impart negative messages. Transfer of a patient to a special room, fewer visits by physicians on their rounds, more hurried ministrations by nurses, whispered communications and other changes in behavior become ominous signs to the sick person. But they also set a pattern for the medical student who accepts them as routines and who, if he does question them, may receive a rationalized answer. Unless students and house staff are given an opportunity to discuss these problems, to learn to accept the more unpleasant aspects of their calling and to make constructive use of their early sensitivity, they will suffer serious conflicts later on.

A second-year medical student reported to me on the interview and examination of an elderly lady suffering from leukemia. A very thorough medical history and a good physical examination had been accomplished, but at no time had the meaning of the illness been talked over with the patient. When I suggested that this approach might be indicated, the student became irritated blurting out, "Why must you stir up trouble? She seemed perfectly happy the way she was." The student had completely ignored the fact that, in spite of the alleged contentment, the lady had consulted numerous doctors between her home in Florida and Missouri, where she was visiting her daughter. One of her complaints was that "nobody tells me anything" and that she had to make important decisions in the near future. The student also ignored the choices of communication available to her and could only think in terms of some definitive message, such as that the patient had cancer and that her life span was extremely limited. She also minimized the patient's knowledge of her condition.

Most patients know that they have a fatal illness, but they may hesitate to talk about it out of consideration for the family. Thus, one often witnesses the tragic spectacle of an entire family suffering because the members wish to "spare" each other's feelings. Our task is not to help patients die, but rather help them live the allotted time remaining. But let us not specify that time because nothing shatters self-esteem or destroys confidence like seeing a patient whom we had told a couple of years earlier that he had only a few more months to live.

The statement, "Nobody tells me anything," is equally fraught with pitfalls. Man, in general, has considerable capacity for selective inattention especially when bad news is involved. We so often feel frustrated to hear a patient ask questions which we believe we have explained time and time again. Yet, all he wishes is to share his feelings and his experiences with another human being or he secretly hopes for more favorable news from another source by cunningly concealing previous information.

Communications do not necessarily focus on the illness and, in fact, rarely do. More often than not, the patient wishes to assure himself of the integrity of his personality, of his self-respect and, in a way, insure some measure of his immortality. The discussion of past or present achievements may well fulfill this purpose. Our principal ways of achieving immortality is by implanting memories of ourselves in the minds of others. An occasional patient will make small presents to his physician or others in the environment to be remembered, and they should be accepted and cherished.

We may want to ask ourselves when the patient should be told or, perhaps better, when the dialogue with the patient should be initiated. The patient will have developed misgivings, worries and doubts about his own condition long before a definitive diagnosis is established. There should be meaningful ongoing communication between physician, patient and family at all times, regardless of the phase of illness. Indeed, such continuous contact is essential to insure future understanding, confidence and mutual respect. Once the diagnosis is established, it may become necessary to propose rather painful or risky treatment methods to which the patient may not readily agree unless he has faith in his doctor's judgment and possesses some insight into the seriousness of his condition. At times, it is more difficult to obtain the patient's consent and cooperation for complex and, perhaps, even painful treatment methods than it is to help him grasp the fatal character of the illness.

Some authors try to distinguish diverse stages of psychological awareness. I shall limit myself to quoting two psychiatrists whose basic theoretical frameworks differ materially. The first, a research analyst,[3] distinguishes three stages: the initial stage of reduced alternative, and intermediate stage of middle knowledge and the terminal stage of counter control and cessation. During the first stage, the patient may feel quite well, which somehow complicates communication and decision-making although the patient may be quite willing to go along with certain modes of treatment. Indeed, it may be largely the family that resists during that period. The psychological atmosphere of this stage also is occasionally referred to as "Closed Awareness." It may have a quality of secrecy with the secret hopefully being shared by patient and physician. Presumably during this stage, the patient must learn to limit his plans for the future and reduce alternatives, to quote the author. I do not necessarily agree with the last concept because of the potentially paralyzing effect on the patient's daily activities.

The second stage of "Middle Knowledge" is essentially characterized by a surge of rapidly alternating and, at times, even opposite defense mechanisms. During this stage, the patient usually deals with certainty as uncertainty. He may consider himself to have recovered from an illness and be ready for new ventures. He may attribute discomforts to treatment rather than to the underlying condition and eventually challenge the physician's judgment. He will frequently enlist the help of family or friends to seek new remedies and grasp avidly at even irrational promises of cures.

The final stage, named "Counter Control and Cessation," consists essentially in "giving up." Unless the intermediate stage has been grossly mismanaged by family or caretakers, much can be done in the professional setting in the last phase to ease the patient's suffering because there is no need for deception or pretense and all efforts can concentrate on the adaptation for the end.

The psychological stages proposed by the other more clinically-oriented psychiatrist[4] number five and differ somewhat in sequence from the earlier described ones. Stage one consists of shock or denial. The patient will feel that somebody has made a mistake, that specimens were mixed up, that "it simply can't be so." He may withdraw or shop around for doctors, anticipating a more favorable judgment. Stage number two consists of anger and rage with bitterness, resentment and, at times, aggressivity. Stage three is the bargaining stage, to wit, "I'll be a good boy or girl—just give me a little more time." This stage is occasionally related to real events. The patients may like to attend the graduation of a child, a wedding, the birth of a grandchild or some similar event representing the previously-mentioned quest for immortality through remembrance. Stage four usually includes depression and preparatory grief. During this stage, the patient may prepare for the inevitable, take care of mundane affairs and simply get ready. Stage five is acceptance. At its very best, it is not simply passive resignation, but a more positive expression of being ready and in peace with their fate. At this point, the patient does not like much commotion, he prefers to have just one favorite visitor at a time and he no longer exhibits concern over his condition.

As in most human affairs, division into stages is a somewhat arbitrary method, especially when taken literally. There is no clear-cut progression from one stage to the next in the course of a fatal illness anymore than there is in early growth and development. Of course, certain attitudes may predominate, but it is equally true that the patient may fall back on earlier modes of adjustment. Eternal watchfulness is required of the physician and nursing personnel who simply must not be satisfied that they have "told the truth," nor should they acquiesce if the patient asks no further question. Communication is not static but an ongoing process, and we must always follow through. The ability to test reality becomes quite brittle when life is at stake. But communication is not limited to language. Attitude may be far more important. At times, we must be prepared to forego medical dignity or pride and engage in activities not customarily associated with the physician's work, but, perhaps, more meaningful to the patient in the later stages of his illness. A few spoonfuls of a favorite dish, a sip of a relished beverage or sharing family snapshots may be far more beneficial than the infusion of a scientifically concocted fluid containing electrolytes, vitamins or antibiotics presumably necessary for survival.

Survival indeed! Sympathy, compassion and understanding set the stage for the eternal survival that the patient craves during the last stages of life.

In this brief presentation, I have been able to hit only the highlights of communication with the fatally ill. I have attempted to bring into focus the nature of the fear of death, the social and cultural attitudes of man in general and, finally, I have concentrated on some of the outstanding conflicts and concerns experienced by the terminal patient and his environment.

In concluding, let me just add four basic rules which were proposed by a perceptive psychiatrist in one of the earlier books on the subject. I consider them to be simple and very meaningful:[5]

1. Do not tell the patient anything that might induce psychopathology.
2. Hope must never die too far ahead of the patient.
3. The gravity of the situation should never be minimized.
4. As much as possible, don't let the patient sit around idly awaiting death.

Radiologic Problem Case

A 79-YEAR-OLD WHITE WOMAN stated that her problem started in March, 1972 with an episode of diarrhea and abdominal cramps. This was accompanied by a mild elevation of temperature. This continued for approximately ten days after which her condition improved except for mild diarrhea. On March 14, 1972, she developed left lower quadrant tenderness.

Past History: The patient had been in generally good health until the present illness. Her only previous complaint was mild urinary dysfunction. The social and family histories were noncontributory.

Physical Examination: The patient was not in acute distress. Heart, ears, nose and throat were unremarkable. There were no glands demonstrable upon palpation. Blood pressure was 180/90. The abdominal examination revealed some tenderness localized to the left lower quadrant. No mass could be appreciated. The pelvic examination and sigmoidoscopic examinations were negative.

Laboratory Data: The SMA-12 values were normal except for a slightly elevated BUN (21.5 mg%) and a LDH which was slightly elevated (223 $m\mu/ml$). Urinalysis was normal. The hemoglobin level was 11.6 gm/100 ml. The hematocrit value was 33%. The white blood cell count was 9,000 per cu mm with a slight eosinophilia. The serum electrolyte determination showed the potassium to be 3.3 mEq/L. The VDRL was nonreactive. The chest X-ray was negative except for a calcified paratracheal node on the left. The EKG revealed a normal sinus rhythm with frequent atrial premature systoles.

Radiological Examination: The barium enema on March 14, 1972 demonstrated an irregular sigmoid with marked encroachment on the lumen so that barium was impeded in its flow through the segment of bowel containing multiple diverticula. The mucosa appeared coarse but intact. The stenosed area was funnel-shaped with gradual narrowing of the bowel lumen. The bowel appeared fixed to the pelvic floor (Fig. 1). The roentgen studies suggested a diverticulitis. An intravenous pyelogram was normal. On May 18, 1972, the patient was reexamined and the lesion was identical to that seen on the original study. The findings again suggested a diverticulitis with fixation of the sigmoid segment indicative of pericolonic inflammation (Fig. 2).

DISCUSSION

A stenotic segment of colon (predominately sigmoid) in the presence of multiple diverticula is statistically most apt to represent diverticulitis, a relatively facile diagnosis.

In the majority of cases, the classical findings will prevail, such as marked spasm associated with an alterable intestinal lumen. The mucosa appears to be intact although course and indurated. In the complicated case, a sinus tract may be demonstrated connecting with a contiguous abscess or adjacent loop of small bowel. In the more esoteric situation, the tract may enter the bladder or kidney.

These findings are in contradistinction to a carcinoma of the colon which is characterized by scalloped margins of bowel abruptly terminating the normal mucosa into an effaced or "apple core" deformity.

The challenge to the radiologist occurs in the case in which the diverticulum is pinched off by inflammation and a defect is observed in what appears to be a smooth-walled large bowel. Here the inflammation may masquerade as a neoplasm. In recent years, Marshak and his coauthors[1] have reported a series of cases in which intramural fistulae of sinus tracts running paral-

---

The authors of this series of articles presenting unusual radiologic problem cases are from the Department of Radiology, Menorah Medical Center, where Doctor Rubin is Chairman.

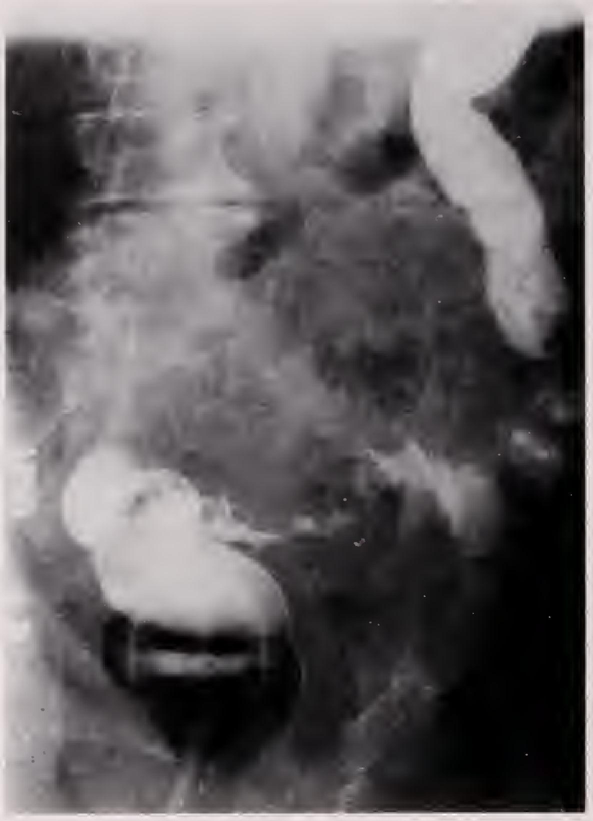

Fig. 1 Colon study revealed a segment of sigmoid containing diverticula and an altered lumen with course appearing mucosa. There is no evidence of fistulae, but the intestine is fixed.

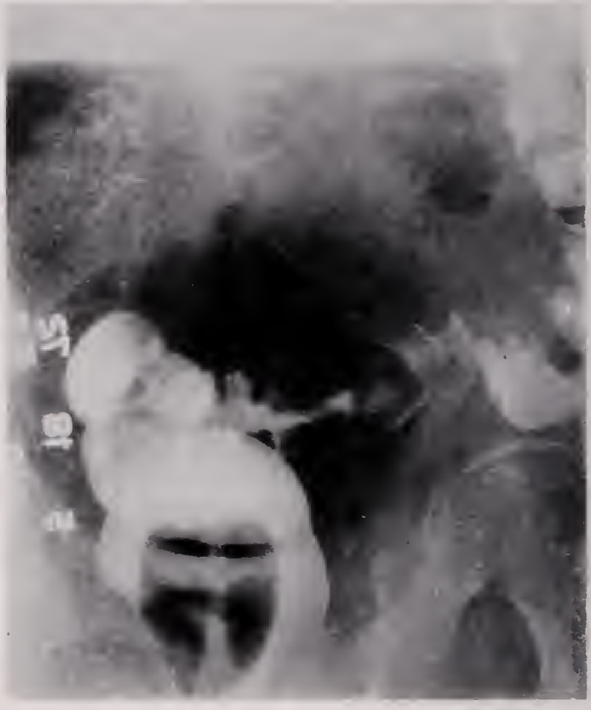

Fig. 2 The bowel is observed in a spot roentgenogram. There is no scalloping demonstrated. The lumen appears encroached upon, but there is no obstruction distal or proximal to the lesion. Fluoroscopy elicited marked discomfort and localized pain.

lel to a segment of diverticula of the colon represents granulomatous colitis (Crohn's disease of the colon). Heretofore, these areas have been considered to be due to diverticulitis. A sinus tract 10 cm or more is considered pathognonomic of granulomatous colitis when the sinus tract is longitudinal and intramural, as elucidated by the authors of this article.

To add further to the problem of differentiating carcinoma from diverticulitis, on rare occasions the neoplasm may contain a fistula with abscess formation, thus modifying the roentgen appearance of the lesion.[2]

In our case, the lumen appeared funnel-like with apparent preservation of the mucosa, which was alterable. Filling of the large bowel with barium evoked pain and inordinate discomfort. There was no scalloping of the peripheral borders of the lesion. In addition, diverticula were seen in and about the narrowed segment. With antibiotics, the patient noted some clinical improvement (most likely the inflammatory component subsided) and a recheck examination was performed. When the repeat study again demonstrated the extreme narrowing of the bowel, surgery was contemplated. The patient was operated on on May 24, 1972.

Radiological Diagnosis: Chronic and acute diverticulitis.

Pathological Diagnosis: A 6 cm-7 cm lesion was removed with attached ovary and posterior aspect of uterus. The lesion consisted of the following:

1. Moderately differentiated mucus producing ulcerating adenocarcinoma with extension to pericolonic fat.
2. Diverticulosis of a segment of colon.

President's Message

Much to the amazement of the entire Missouri delegation at the AMA Clinical Session on November 26-29 in Cincinnati, one of the MSMA Councilors was unaware of the existence of the Missouri Room.

At each Annual and Clinical Session of the AMA, our Association maintains a special room to which every member of the MSMA is cordially invited. Here the member may consult with the officers and delegates of the MSMA and express his opinions concerning the legislative problems before the House of Delegates. Those members with particularly specific knowledge on certain issues can testify before AMA Reference Committees to make their positions known.

Walter T. Gunn, M.D.

The Missouri Room also is used for daily caucuses of all the MSMA officers and delegates to disseminate information each has collected while attending debates in all of the Conference Committees. Policy is thus determined and implemented by our four AMA Delegates.

The room also serves as a forum to introduce to the delegates from other states those candidates which the Missouri delegation is supporting for election to AMA councils and committees. Finally, the candidates for elective offices in the AMA visit the room to present their policies and opinions to the Missouri delegation.

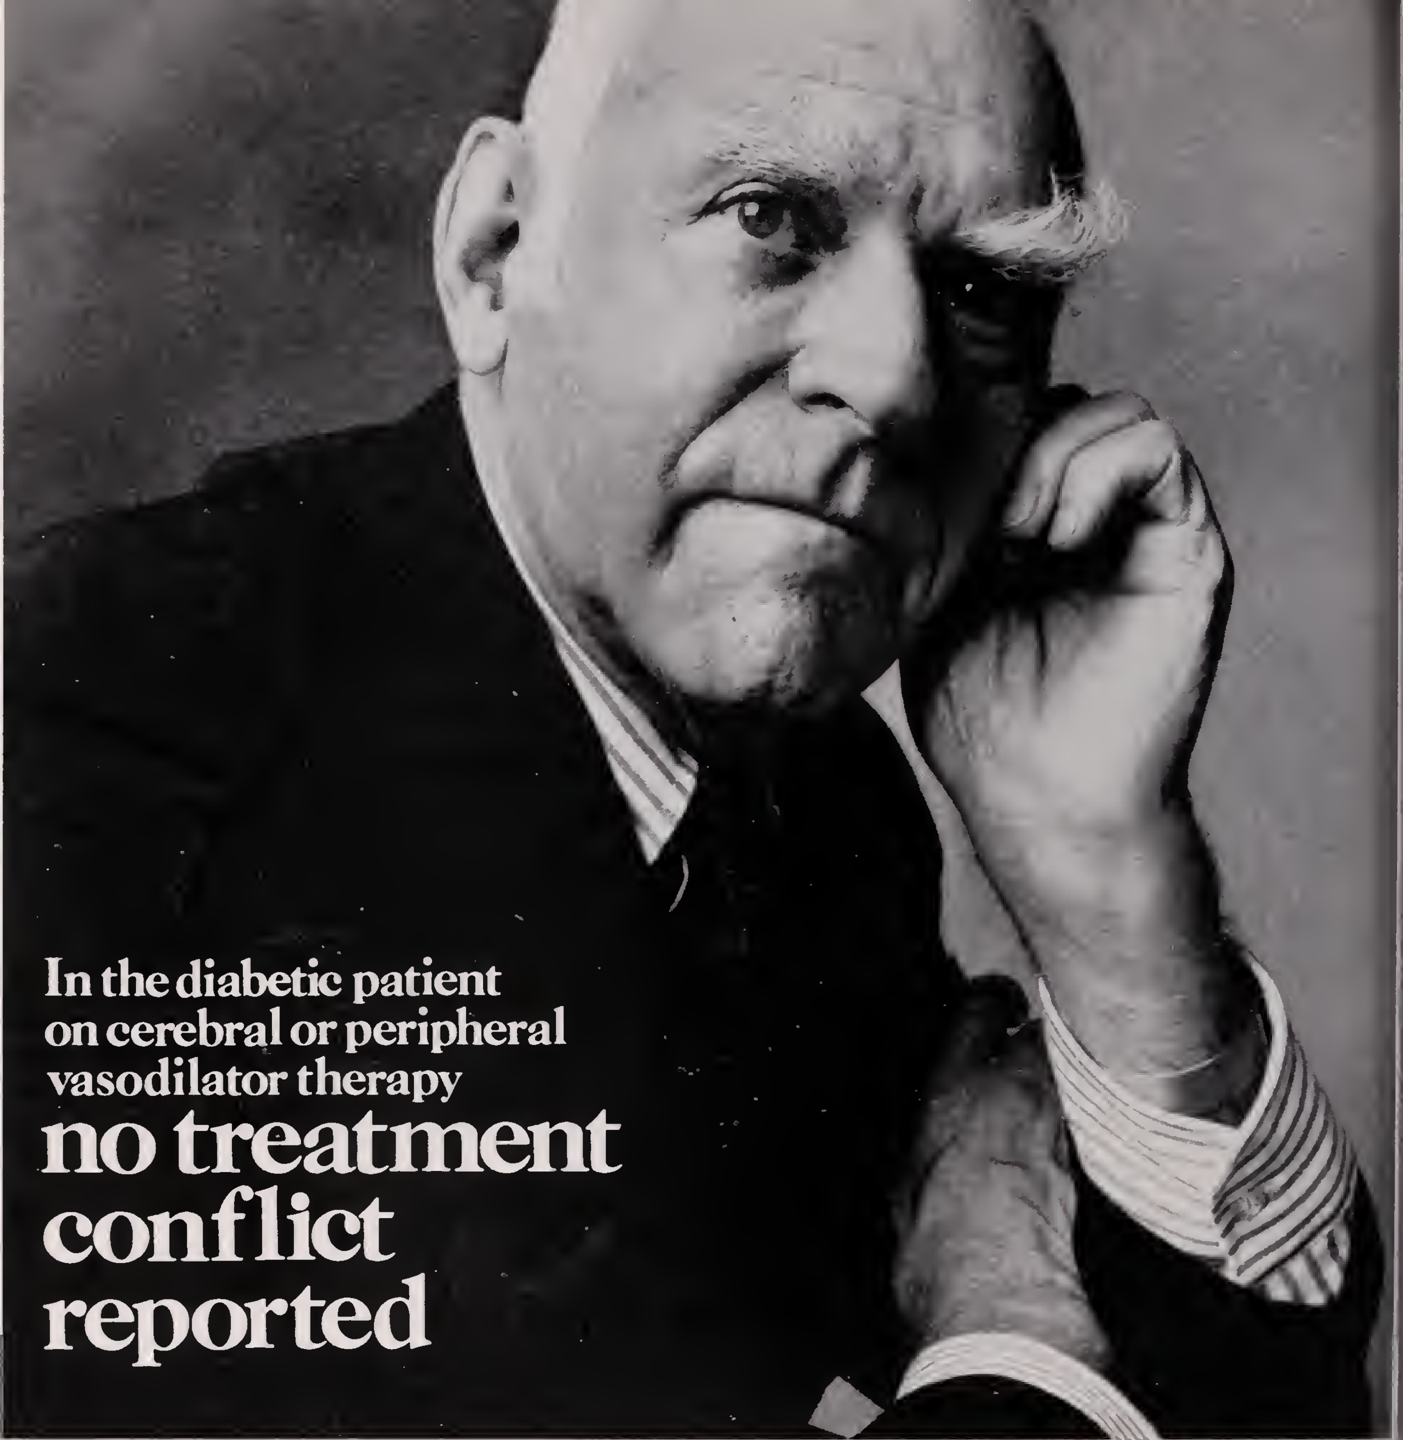
As we have all come to expect, the Missouri delegation again did a fine job of representing our Association at the meeting.

Quotable quotes from the meeting:

"HMO is a concept searching for a structure."

"We, too, had a drug problem as teenagers—what drugs to use to clear up those pimples."

An elder statesman urging the continuation of smallpox vaccination said, "Some of you youngsters opposing smallpox vaccination have never seen a case of smallpox." He then showed a series of slides reminiscent of the horror VD training films of World War II.



VASODILAN®
(ISOXSUPRINE HCl)
the compatible vasodilator

• no interference with diabetic control . . . does not al
carbohydrate metabolism.[1]

• conflicts have not been reported with diuretics,
corticosteroids, antihypertensives or miotics.

There are no known contraindications in recommenc
oral doses other than it should not be given in the pres
of frank arterial bleeding or immediately postpartun

INDICATIONS: Based on a review of this drug by the National Academy of Sciences–National Research Council and/or other information, the FDA has classified the indications as follows:

Possibly Effective:

1. For the relief of symptoms associated with cerebral vascular insufficiency.
2. In peripheral vascular disease of arteriosclerosis obliterans, thromboangiitis obliterans (Buerger's disease) and Raynaud's disease.
3. Threatened abortion.

Final classification of the less-than-effective indications requires further investigation.

Woman's Auxiliary

We, of the Woman's Auxiliary, have many new and important resolutions for the coming year. We have been challenged to help preserve the freedom and rights of private physicians. We must help to strengthen the AMA's hand in Washington and to expand health education programs on the community level. We must continue to encourage membership in AMPAC and MMPAC for all physicians' wives, as well as physicians, especially since we are told that national health insurance will be considered early in the next congress. Increased membership is still my top priority for the year, and we must renew our efforts to achieve our goals.

Do read Harry Schwartz's new book, "A Case for American Medicine." This book presents excellent cases for American Medicine that should help to influence a change in public attitude. It is exciting to learn that the public temper is becoming more favorably disposed toward medicine. Ernest B. Howard, M.D., AMA Executive Vice-President, has predicted a sharp change in the attitude of young physicians who are now beginning to work with the establishment.

Mrs. Keith D. Jones
President

I am pleased to report to you that . . .

. . . The Woman's Auxiliary appreciates the invitation from Dr. Richard Bowles and Dr. John I. Matthews to participate in the MSMA Annual Public Affairs Conference in Jefferson City on February 3-4. The Auxiliary voted to support the conference and, in addition, will hold a midwinter Board meeting on the morning of February 3 for our current and incoming board members.

. . . Our MSMA Auxiliary's Health Education Conference has been selected by the AMA Woman's Auxiliary as the pilot program for all other state auxiliaries. This honor would not have been possible without the help and support of the MSMA. Hopefully, each local community will sponsor a similar conference so that EFFORT will be coordinated everywhere and EFFECT will take place.

. . . Dr. Paul R. Whitener has donated a beautiful wooden plaque to be awarded to the Auxiliary which gives the most per capita to the Missouri State Medical Foundation. It will be rotated to the top Auxiliary each year. At this time, the Auxiliary members have donated more than $1,000 to the MSMF, and we hope that each county auxiliary has a fund raising project for this worthwhile cause. If a MSMA member makes his contribution in his wife's name, her county auxiliary will receive credit.

. . . I'd like for everyone to start the New Year with a smile, so I'll share a funny story about a group of youngsters who elected a four-year-old boy to be their president. They explained, "Well, it's like this. He doesn't write, so he couldn't be secretary. He can't count, so he couldn't be treasurer. He's too little to throw anybody out, so he wouldn't be a good sergeant-at-arms. If we didn't choose him for some office, he'd be unhappy and cry. So . . . we just elected him president!" (My apologies to all of our new county auxiliary presidents . . . and best wishes to everyone for a great 1973.)

EDITORIAL

'BIG BROTHER' HEALTH SCHEMES

Reality for some of our legislators in Washington is a terrible thing. They simply can't face it.

This becomes painfully clear when the subject of health insurance is raised.

Sen. Edward Kennedy chooses to ignore the fact that the federal government is now spending so much money there is no way to increase these record outlays without also enacting big tax hikes.

He proposes a federally-financed national health insurance program that would cost the government from $53 billion to $77 billion by 1974.

To finance this huge program, the Kennedy plan would tax employes 1 per cent on income up to $15,000, employers 3.5 per cent of the total payroll and extract the remaining funds by taking 3.5 per cent of general revenues.

This, of course, is fiscal madness.

Employers, starting in January, will be matching the 5.85 per cent Social Security tax employes pay on the first $10,000 of their salary. Kennedy would add 3.5 per cent of the total payroll cost to this.

And, by taking 3.5 per cent of general revenues, he would automatically force either an equivalent tax increase or addition to the anticipated annual deficit of about $30 billion.

Kennedy has to be dreaming if he thinks this is possible.

Obviously, many employers couldn't take another big confiscation of their receipts for this or any other purpose without going broke.

Just matching the Social Security increases that come nearly every year is getting to be increasingly difficult for some owners.

Republicans rightly oppose the irresponsible Kennedy health plan. But what do they offer?

They would require all employers of one or more persons, with few exceptions, to "provide minimum-standard health-insurance protection for their employes and dependents of employes."

They would insist that an employer pay at least 65 per cent of the premium costs initially, and 75 per cent later.

This is just as bad as Kennedy's plan to hit companies with an across-the-board 3.5 per cent.

The government has no authority to tell businessmen they must provide for 65 per cent or 75 per cent of their employes' health insurance.

It has already saddled them with an open-ended Social Security expense. It is unthinkable to heap a big, mandatory health insurance program on top of this.

Most businesses are doing extremely well if they can make a profit of 7 per cent on their gross sales and 4.5 per cent after taxes. There is a limit on how much most firms can take from their profits and apply to employe benefits.

This is the reality that must be faced.

If the present trend of loading up businesses with all kinds of social responsibilities continues, profits will drop to the vanishing point, with the result that there won't be enough money either for new capital investment or research and development.

When this happens, there will be no way for the economy to go but down. Which will bring on a recession, loss of many millions of jobs and the end to the pipedreams of the social planners.

IMPROVED ACCIDENT & HEALTH PROGRAMS

The Disability Income Policy sponsored by the Missouri State Medical Association since 1943 has now been made GUARANTEED RENEWABLE and income benefits are available up to $300.00 weekly to members under age 56 subject to acceptance by the Company.

Also, the Major Hospital and Nurse Expense Program offers higher limits with increased Room & Board Benefits.

Symposium on Management of the Burn Patient

A symposium on the management of the burn patient will be held at the Chase Park Plaza Hotel on Feb. 16-17, 1973, under the joint sponsorship of the Department of Plastic and Reconstructive Surgery and the St. Louis Committee on Trauma of the American College of Surgeons.

The program is designated to inform general surgeons, emergency department physicians and other primary care physicians about the most recent advances in burn therapy.

Speakers will include Dr. Basil Pruitt, Burn Unit, Brooke General Hospital, San Antonio, Tex. and Dr. Paul Weeks, Director, Burn Unit, Barnes Hospital, St. Louis. The program is under the direction of Dr. Robert C. Wray, M.D., F.A.C.S., Assistant Professor of Plastic and Reconstructive Surgery, and Dr. Allen P. Klippel, M.D., F.A.C.S., Chairman, St. Louis Committee on Trauma, A.C.S.

Participants in the program will be accredited by the American Academy of Family Practice. Interested physicians should contact Dr. Robert C. Wray, M.D., F.A.C.S., 4960 Audubon Ave., St. Louis, Mo. 63110.

AMA National Congress on Quality of Life

"The Middle Years" will be examined at a second AMA National Congress on the Quality of Life to be presented March 7-9 in Chicago. The program will focus on the struggles and opportunities encountered during early adulthood, mature adulthood and in the transitional years (55-65). Goal of the Congress, one of a continuing series of Quality of Life programs being sponsored by the AMA, is to stimulate coordinated interdisciplinary efforts to improve health, social, educational and environmental conditions. Direct inquiries to "Quality of Life," AMA.

County Society News

FIRST DISTRICT

COUNCILOR
JOHN N. MARTIN, M.D., ST. JOSEPH

Buchanan County Medical Society

For the 17th consecutive year, members of the Buchanan County Medical Society and the St. Joseph Bar Association met jointly for a dinner and program. Eighty-two physicians and attorneys attended the event in the Empire Room of the Hotel Robidoux in November.

As presidents of the two professional groups, Lawrence H. Pifer, M.D. and Stanley I. Dale, a former mayor of St. Joseph, presided jointly. Speaker for the occasion was Herbert C. Modlin, M.D., chairman of the Department of Preventive Psychiatry at the Menninger Foundation in Topeka, Kan. His subject was "Traumatic Neurosis."

Doctor Modlin was introduced by Wendell E. Koerner, Jr., chairman of the Bar Association's program committee. Martin J. Fischer, M.D., was chairman of arrangements for the Medical Society.

William B. O'Connor, M.D., *Secretary*

Grand River Medical Society

Thirty members, wives and guests met at the Strand Hotel in Chillicothe on November 9, 1972 for a social hour and dinner.

William F. Benson, M.D., Kansas City, was the speaker and gave a comprehensive discussion of "Infections, Injuries and Reconstructive Surgery of the Hand."

The Woman's Auxiliary auctioned Korean egg rolls, brownies, pecan pies, homemade bread, "Hello Dollies," nuts, relish and other food items. The proceeds will be given to the AMA-ERF.

The Emergency Medical Program of the Regional Medical Program was discussed, and the Grand River Medical Society went on record as favoring the program in principle.

Delegates and alternates for the MSMA Annual Session in St. Louis on March 29-April 1 were elected, as follows: *Caldwell County*, Frank R. Daley, Hamilton, and George Mandler, Chillicothe; *Carroll County*, E. W. Allen and John H. Platz, Carrollton; *Daviess County*, Edward E. Nixon, Gallatin, and Larry Dowell, Pattonsburg; *DeKalb County*, B. D. Howell, Brookfield, and E. L. Bales, Carrollton; *Grundy County*, Albert D. Cross and William A. Fuson, Trenton; *Harrison County*, Merriam Gearhart, Bethany, and Willard Ellsworth, Cainsville; *Linn County*, John R. Dixon and Robert W. Smith, Brookfield; *Livingston County*, Tom N. Cofer and Donald M. Dowell, Chillicothe; *Mercer County*, Windsor B. Atcheson, Trenton, and Joseph Conrad, Chillicothe.

Frank R. Daley, M.D., *Secretary*

SECOND DISTRICT

COUNCILOR
LYSLE M. BACH, M.D., HANNIBAL

Chariton-Macon-Monroe-Randolph County Medical Society

The regular meeting of the Chariton-Macon-Monroe-Randolph County Medical Society was held on November 9 in the Medical Library at Woodland Hospital in Moberly.

Officers for 1973 were elected as follows: President, Robert H. Young, Moberly; Vice-President, James E. Campbell, Macon; and Secretary-Treasurer, Robert V. Tompson, Moberly.

Charles E. Mengel, M.D., Chairman of the Department of Medicine, University of Missouri-Columbia Medical Center, provided the program, which was arranged by Dr. J. Will Fleming, Jr. Doctor Mengel's subject was "Blood and Drugs." Following his formal discussion, he answered many questions from the floor.

Members present were Drs. Gretchen D. Collins and D. E. Eggleston, *Macon County;* F. A. Barnett, *Monroe County;* Josephine D. Baker, W. D. Chute, C. C. Cohrs, P. V. Dreyer, T. S. Fleming, L. E. Huber, R. V. Tompson and Robert H. Young, *Randolph County*.

Guests were David Fleming, son of Dr. J. Will Fleming, and Russ Burcham, who are medical students at the University of Missouri Medical Center.

W. D. Chute, M.D., *Secretary*

EIGHTH DISTRICT

COUNCILOR
HOWARD J. McALHANY, M.D.,
SPRINGFIELD

Jasper County Medical Society

The November meeting of the Jasper County Medical Society was held at Twin Hills Golf and Country Club in Joplin.

James D. Dexter, M.D., Assistant Professor of Medicine (Neurology), University of Missouri-

Columbia School of Medicine, presented a scientific program entitled "Headaches—Diagnosis and Treatment."

Doctor Dexter was the co-recipient of the American Academy of General Practice Gold Medal Award for his exhibit dealing with chronic reoccurring headache, aspects of diagnosis and differential diagnosis in 1968. He also was the co-recipient of the Benjamin Rusk Silver Award for scientific exhibit of the American Psychiatric Association in 1969. A native of Independence, he attended the University of Missouri School of Medicine and received his M.D. degree in 1963.

TENTH DISTRICT

COUNCILOR
EUGENE T. HANSBROUGH, M.D.,
POPLAR BLUFF

Butler-Wayne-Ripley County Medical Society

The Tri-County Medical Society elected officers for the coming year at its October meeting in Poplar Bluff. They are Drs. E. C. Carlson, President; Ricardo M. Ramirez, Vice-President; Tom Wood, Secretary; and Barry B. White, Treasurer.

Dunklin County Medical Society

Dr. W. D. English, Cardwell, was elected President of the Dunklin County Medical Society at the November meeting. He will succeed outgoing President M. L. Sisler, Kennett. Other newly-elected officers are Drs. C. R. Peck, Kennett, Vice-President; Quinton Tarver, Kennett, Secretary; and George Q. Dunmire, Kennett, Delegate to the MSMA House of Delegates.

"Now, that's what I call a booster shot!"

New Members

Adhmed S. Abdel-Salam, M.D., George Dimmitt Memorial Clinic, Humansville, has become a member of Dallas-Hickory-Polk-Dade County Medical Society. Dr. Abdel-Salam is a native of Cairo, V.A.K., received his preliminary education at Cairo University and his M.D. degree at Cairo University in 1966. He specializes in orthopedic surgery.

Andres G. Apostol, M.D., 801 Lincoln, Monett, has become a member of Ozarks Medical Society. Dr. Apostol is a native of Ilagan, Isabela, Philippines, received his preliminary education at St. Ferdinand College and University of Santo Tomas and his M.D. degree at University of Santo Tomas in 1964. He specializes in general surgery and general practice.

Arnold Z. Balanoff, M.D., 601 E. 63rd, Kansas City, has become a member of Jackson County Medical Society. Dr. Balanoff is a native of Des Moines, Ia., received his preliminary education at the University of Iowa and his M.D. degree at the University of Iowa in 1967. He specializes in pediatrics.

Barbara N. Buchanan, M.D., 4643 Wyandotte, Kansas City, has become a member of Jackson County Medical Society. Dr. Buchanan is a native of St. Louis, received her preliminary education at the University of Missouri-Columbia and her M.D. degree at the University of Missouri-Columbia in 1961. She specializes in psychiatry (child and adolescent).

George A. Carder, M.D., 434 Blue Ridge Tower, Kansas City, has become a member of Jackson County Medical Society. Dr. Carder is a native of Liberty, received his preliminary education at William Jewell College and his M.D. degree at Washington University in 1964. He specializes in otorhinolaryngology.

Michael A. Gentry, M.D., 1211 S. Glenstone, Springfield, has become a member of Greene County Medical Society. Dr. Gentry is a native of Ava, received his preliminary education at Southern Methodist University and his M.D. degree at the University of Missouri in 1964. He specializes in dermatology.

Frederic L. Hamburg, M.D., 2757 Normandy, Springfield, has become a member of Greene County Medical Society. Dr. Hamburg is a native of Evansville, Ind., received his preliminary education at Vanderbilt University and his M.D. degree at Vanderbilt University in 1966. He specializes in pediatrics.

Fritz M. Johnson, M.D., 609 Cherry, Springfield, has become a member of Greene County Medical Society. Dr. Johnson is a native of Hobart, Okla., received his preliminary education at Kansas University and his M.D. degree at Kansas University in 1965. He specializes in thoracic and cardiovascular surgery.

Mohammed Igbal Karatela, M.D., Apt. F, 4278 Chateau DeVille Dr., Mehlville, has become a member of St. Louis County Medical Society. Dr. Karatela is a native of Rajkot, India, received his preliminary education at D. J. Science College and his M.D. degree at Dow Medical College in 1964. He specializes in child psychiatry.

Wallace McDonald, M.D., 301 N. 8th, St. Joseph, has become a member of Buchanan County Medical Society. Dr. McDonald is a native of St. Louis, received his preliminary education at the University of Missouri and his M.D. degree at the University of Pennsylvania in 1966. He specializes in internal medicine.

Edwin J. Masters, M.D., 310 W. Gabriel, Advance, has become a member of SEMO County Medical Society. Dr. Masters is a native of Poplar Bluff, received his preliminary education at Dartmouth College and his M.D. degree at the University of Tennessee in 1971. He specializes in general practice.

Carl M. Mentgen, M.D., 1550 E. Sunshine, Springfield, has become a member of Greene County Medical Society. Dr. Mentgen is a native of Marysville, Kan., received his preliminary education at Kansas State University and his M.D. degree at Kansas University in 1965. He specializes in internal medicine.

Dwarka Nath Mishra, M.D., Humansville, has become a member of Dallas-Hickory-Polk-Dade County Medical Society. Dr. Mishra is a native of Hajipur, India, received his preliminary education at Patna Science College and his M.D. degree at Darbhanga Medical College in 1950. He specializes in general practice (emphasis on surgery and urology).

Bin Mou, M.D., Nevada State Hospital, Nevada, has become a member of West Central Missouri Medical Society. Dr. Mou is a native of China, received his preliminary education at Enshi, Hupei, China and his M.D. degree at National Defense Medical College in 1950. He specializes in psychiatry.

Somporn Nukrongsin, M.D., Jewish Hospital of St. Louis, St. Louis, has become a member of

St. Louis County Medical Society. Dr. Nukrongsin is a native of Bangkok, Thailand, received his preliminary education at Chulalongkorn University Faculty of Science and his M.D. degree at Siriraj Hospital University of Medical Science in 1963. He specializes in anesthesiology.

Gordon S. Paulson, M.D., Suite 210, Pioneer Bldg., St. Joseph, has become a member of Buchanan County Medical Society. Dr. Paulson is a native of Tyler, Minn., received his preliminary education at Olaf College and the University of Minnesota and his M.D. degree at the University of Minnesota in 1943. He specializes in internal medicine.

Larry W. Piebenga, M.D., 132 Penn Park Medical Center, Kansas City, has become a member of Jackson County Medical Society. Dr. Piebenga is a native of Volga, S. D., received his preliminary education at the University of Arkansas and his M.D. degree at the University of Arkansas in 1964. He specializes in ophthalmology.

Kamalesh K. Reddy, M.D., 4643 Wyandotte, Kansas City, has become a member of Jackson County Medical Society. Dr. Reddy is a native of Hyderabad, India, received her preliminary education at Women's College, Hyderabad, India and her M.D. degree at Osmania Medical College in 1961. She specializes in psychiatry (general and child).

Dean R. Rising, M.D., 1211 S. Glenstone, Springfield, has become a member of Greene County Medical Society. Dr. Rising is a native of Kansas City, received his preliminary education at the University of Kansas and his M.D. degree at the University of Kansas in 1966. He specializes in pediatrics.

Judy C. Robbins, M.D., 2435 E. Cambridge, Springfield, has become a member of Greene County Medical Society. Dr. Robbins is a native of Ft. Worth, Tex., received her preliminary education at the University of Oklahoma and her M.D. degree at the University of Oklahoma in 1967. She specializes in anesthesiology.

Narendra M. Saxena, M.D., Missouri State Chest Hospital, Mt. Vernon, has become a member of Ozarks Medical Society. Dr. Saxena is a native of Gwahior, India, received his preliminary education at Vietone College and his M.D. degree at MAM Medical College in 1969. He specializes in chest medicine.

Wayne Stubblefield, M.D., 1715 Boonville, Springfield, has become a member of Greene County Medical Society. Dr. Stubblefield is a native of Winchester, Tenn., received his preliminary education at the University of Tennessee and his M.D. degree at the University of Tennessee in 1967. He specializes in general practice.

Robert R. Stuber, M.D., Suite 210, Pioneer Bldg., St. Joseph, has become a member of Buchanan County Medical Society. Dr. Stuber is a native of St. Joseph, received his preliminary education at the University of Kansas and his M.D. degree at the University of Kansas in 1965. He specializes in internal medicine.

Robert L. Sugar, M.D., 14 Doctor's Bldg., Kansas City, has become a member of Jackson County Medical Society. Dr. Sugar is a native of Brooklyn, N. Y., received his preliminary education at Long Island University and his M.D. degree at State University of New York-Downstate in 1966. He specializes in obstetrics and gynecology.

Thomas P. Thamarappally, M.D., 220 Penn Park Medical Center, Kansas City, has become a member of Jackson County Medical Society. Dr. Thamarappally is a native of Kerala, India, received his preliminary education at the University of Agra-Agra and his M.D. degree at Bangalor Medical College in 1961. He specializes in otorhinolaryngology.

Roger J. Waxelman, M.D., 7619 Stanford, St. Louis, has become a member of St. Louis County Medical Society. Dr. Waxelnan is a native of St. Louis, received his preliminary education at Washington University and his M.D. degree at the University of Missouri-Columbia in 1969. He specializes in pediatrics.

Joseph J. Woehl, M.D., 620 Medical Plaza, Kansas City, has become a member of Jackson County Medical Society. Dr. Woehl is a native of Bayonne, N. J., received his preliminary education at the Georgetown University and his M.D. degree at New York Medical College in 1959. He specializes in neurology.

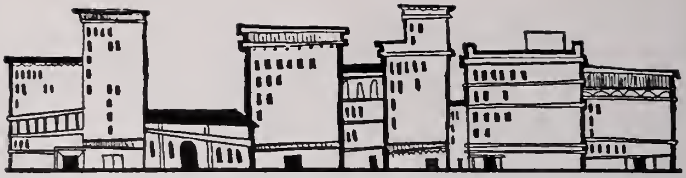
MSMA 115TH ANNUAL SESSION

Welcome, New Members!

March 29-April 1,
1973

Chase-Park Plaza Hotel
St. Louis

From the Medical Schools



ST. LOUIS UNIVERSITY

Dr. Edward A. Doisy, Sr., Nobel Laureate and distinguished service professor and chairman emeritus of the Edward A. Doisy Department of Biochemistry, St. Louis University School of Medicine, was the recipient of the 12th annual Barren Foundation medal presented in Chicago on Nov. 15, 1972.

Dr. Doisy

The Barren Medal is presented each year to a distinguished member of the medical profession who, in the opinion of the Barren Foundation Medical Advisory Board, has made a major contribution toward progress and research in the field of reproduction.

In 1929, Doctor Doisy was the first to isolate estrogenic hormone from human urine, obtaining estrone in crystalline form. In 1943, he shared the Nobel Prize in physiology and medicine with *Dr. Henrik Dam* for isolating and determining constitution and synthesis of Vitamin K.

Doctor Doisy was honored by St. Louis University upon his retirement in 1965 when a day-long scientific symposium was held at which four other Nobel Prize winning scientists spoke.

A new research wing addition to the St. Louis University School of Medicine named Doisy Hall was dedicated in 1968 to honor him as one of the most distinguished professors ever to hold faculty rank at the University.

Dr. Robert H. Felix, dean of the School of Medicine and former director of the National Institute of Mental Health, was honored by the Mental Health Section Centennial Award of the American Public Health Association.

The award, an honor plaque, was presented on Nov. 15, 1972 in Atlantic City at a luncheon during the APHA's centennial celebration.

Dean Felix was cited for being responsible more than any other man for the progress which has been made in the United States in the nation's attack on mental illness and the struggle for mental health.

Dr. Felix

The Dean's honor citation said in part "your long and highly distinguished career in the Public Health Service reached a peak with your appointment as Chief of the Mental Hygiene Division in 1944, the predecessor organization of the National Institute of Mental Health." It continued, "Perhaps the climax of your work came in 1963 when the 88th Congress enacted the Community Mental Health Centers Act authorizing funds to aid in constructing comprehensive community mental health centers across the nation. Literally hundreds of professional people have responded to your ability to attract and help us develop in our own fields through your encouragement and leadership."

Dr. Mabel Ross, formerly Regional Medical Director of the Regional Medical Office, U. S. Public Health Service, accepted the award for Dean Felix who was attending the Federal Hospital Council meeting in Washington at the time.

The new research building of the Anemia and Malnutrition Research Center of Chiang Mai University and St. Louis University located in Chiang Mai, Thailand, will be dedicated at a ceremony presided over by the King of Thailand during the period of Jan. 8-11, 1972. The Research Center was established by the two Universities in 1967 with the aid of grants from the National Institutes of Health under the Japan-U. S. Medical Sciences Program and has been in operation in temporary quarters since its establishment. The new building to house the Center has been under construction since 1969 and was completed in October 1972 with the aid of funds appropriated by the Thailand Government and the Rockefeller Foundation.

Dr. Robert E. Olson, professor and chairman of the Edward A. Doisy Department of Biochemistry, who is director of the Center, will be present to participate in the symposium on Malnutrition and in the dedication ceremony.

UNIVERSITY OF MISSOURI-COLUMBIA

Giulio J. Barbero, M.D., nationally-known for his work in pediatric gastroenterology and nutrition research for children, became the new chair-

A name

☐ Totacillin (ampicillin trihydrate) capsules equivalent to 250 mg. and 500 mg. ampicillin, for oral suspension equivalent to 125 mg./5 cc. and 250 mg./5 cc. ampicillin.
☐ Pyopen (disodium carbenicillin) vials for injection equivalent to 1 gm. and 5 gm. of carbenicillin.
☐ Bactocill (sodium oxacillin) capsules equivalent to 250 mg. and 500 mg. oxacillin and vials for injection equivalent to 500 mg. and 1 gm. oxacillin.

Dr. Barbero

man of the Department of Pediatrics at the School of Medicine on December 15, 1972.

The Pediatrics Department has been headed by *Dr. Robert L. Jackson* since the four-year medical school was established in Columbia in 1956. Doctor Jackson will remain as professor in the department, concentrating on his primary interest in diabetic children. Under his direction, the Midwest's largest clinic for children with diabetes is operated through the University Medical Center.

Chairman of pediatrics at Hahnemann Medical College and Hospital in Philadelphia for the past six years, Doctor Barbero has been especially active in the national Cystic Fibrosis Research Foundation. In 1969, he was president of the Philadelphia Pediatric Society. He also has served on the committee on children with handicaps for the American Academy of Pediatrics and on a drug study committee for the National Research Council.

Doctor Barbero received his undergraduate education at the University of Maine and was awarded the M.D. degree in 1947 from the University of Pennsylvania. He took residency training at Children's Hospital in Philadelphia and received board certification in 1954. He began an academic career in medicine at the University of Pennsylvania and was on the staff there until he went to Hahnemann in 1967.

"Doctors and Computers" was the topic *Dr. Gwilym S. Lodwick* discussed at a meeting of the Sigma Xi science fraternity on November 16, in Memorial Union auditorium.

Doctor Lodwick, professor and chairman of the Department of Radiology in the School of Medicine, was announced last spring as the winner of the Sigma Xi award for research for 1972.

Internationally recognized for his research in computer applications in radiology, Doctor Lodwick has been largely responsible for inaugurating interdisciplinary bioengineering programs on the Columbia campus. He is noted for his pioneering efforts in computer-assisted diagnosis of bone tumors and, more recently, development of a computer program for automated diagnosis of heart and lung disease.

Prof. Wayne Decker, chairman of the Department of Atmospheric science, is president of the Missouri chapter and presided at the award banquet.

Linley E. Watson, M.D., assistant professor of medicine at the University Medical Center, presented a paper to the 1972 scientific sessions of the American Heart Association in Dallas, Tex. on November 16. He discussed the residual contractile left ventricle in patients with left ventricular aneurysm. Co-authors of the paper are Drs. *Richard H. Martin,* chief of cardiology, and *Donald W. Dickhaus* of the Department of Medicine.

WASHINGTON UNIVERSITY

Carl F. Moyer, M.D., chief resident in orthopedic surgery at Barnes Hospital, has received the fifth J. Albert Key Memorial Fellowship at Washington University School of Medicine.

The award and accompanying $500 honorarium were presented Tuesday to Doctor Moyer on Dec. 5, 1972 by *Fred D. Reynolds,* M.D., professor of orthopedic surgery.

The fellowship was established as a memorial to the late professor of orthopedic surgery at the Medical School from 1924 to 1955. Doctor Key also served as president of both the American Academy of Orthopedic Surgeons and the American Orthopedic Association. The award is given to an orthopedic resident who has demonstrated exceptional ability and performance.

Previous recipients are *W. Edward Lansche,* M.D., 1959; *William S. Costen,* M.D., 1951; *Raymond A. Ritter,* M.D., 1967; and *James C. Ellsasser,* M.D., 1969. Doctors Lansche and Costen are clinical instructors and Doctor Ellsasser is assistant professor of orthopedic surgery.

Doctor Moyer received the M.D. degree in 1966 from Marquette University School of Medicine, Milwaukee, Wis., where he was elected to Alpha Omega Alpha national medical honor society. After internship at Wayne County General Hospital in Eloise, Mich. and two years of medical service with the Army, he came to Washington University Medical Center.

Two Russian scientists were scheduled to visit Washington University School of Medicine on November 19-22, 1972 as participants of a National Cancer Institute exchange program.

The visitors, Dr. A. I. Pirogov and Dr. Ekaterina S. Kisileva, are from the Herzen Oncological Institute, Moscow, where he is chief of the Thoracic Surgery Department and she is chief of the Radiotherapy Department. They were on a two-month tour of cancer centers and medical schools to make arrangements for Russian physicians and scientists to study in the United States.

The exchange program is part of the National Cancer Act passed in August, 1971, by Congress and signed into law by President Nixon in December, 1971.

CLASSIFIED ADS

MEDICAL CLINIC BUILDING—On just under five acres overlooking I-29. Brick ranch, 12 rooms; surgery, x-ray, examining offices, strikingly large reception room with wood-burning fireplace. Basement has separate entrance. Other possible business potential. Great Platte County location, five minutes from KCI Airport on I-29. Breen Realty, Millie Woodell—AC-816-741-1550 or 741-6747.

URGENT NEED—For specialists in Pediatrics, OB-GYN, ENT, Orthopedics and General Practice. Opportunities group, Associate and solo practice. Drawing area over 60,000 population. 275 hospital beds. Write President, County Medical Society, Box 311, Hannibal, Mo. 63401.

PHYSICIAN—Sutter Clinic, Inc., St. Louis, Mo., seeks physician for appointment as Associate. Six-man group, specializing in Occupational Medicine and Surgery. Office practice only. Excellent remuneration. All benefits. Regular hours. Call or write Mr. John M. Hackett, Administrator, Sutter Clinic, Inc., 819 Locust St., St. Louis, Mo. 63101 (include curriculum vitae) or call collect—Area Code 312/621-4300.

WANTED—House physician on internal medical service. Monday through Friday, 8 to 5. Applicant must have Missouri license. Remuneration on basis of experience. Contact Dr. L. B. Harrison, 1755 South Grand, St. Louis, Mo. Phone 314-771-0500.

O'FALLON PROFESSIONAL CENTER—O'Fallon, Missouri, offers an opportunity to start a new practice or relocate a stagnant one in the fastest growing area in the fastest growing county in the state, St. Charles County. Forty minutes from downtown St. Louis. New medical building to be completed in May. Over 1600 square feet available. Try it-You'll like it! Call Lawrence Bellon, D.D.S. (314) 272-5777 or (314) 227-7270.

DOCTOR'S PRACTICE—Grossing $65,000-$75,000 per year. Large home, separate apartment, complete office including equipment—entire package, $77,500. For more information, write R. E. Harland, M.D., 118 N. Main St., Ironton, Mo. 63650.

$316,000 PRACTICE—By Board Surgeon and Board Internist, 55 and 53 years old. Both retiring. Excellent opportunity to continue this practice. Good hospital affiliations and completely equipped office in Kansas City, Mo. Write Box 381, Missouri State Medical Association, 515 E. High, Jefferson City, Mo. 65101.

GENERAL PRACTITIONER OR INTERNIST—Willing to do general practice, OB optional. Salary or percentage in Corporation Practice. Financial remuneration negotiable. Town of over 5,000 near Kansas City. Recreational facilities. Minimal night call. Vacation and time for postgraduate course. Open staff JCAH Hospital. Contact C. T. Riley, M.D., P. O. Box 68, Richmond, Mo. 64085. AC 816-776-6945 or 816-776-6069.

WANTED—Physician under 40 years of age interested in joining a group in Occupational Medicine in Kansas City, Mo. Write to Box 377, Missouri State Medical Association, 515 E. High, Jefferson City, Mo. 65101.

OB-GYN and PEDIATRICIAN—To practice with a seven-physician group in a picturesque and historic river town in Northeast Missouri. Excellent hospitals and schools. Salary leading to early partnership. Write Box 376, Missouri State Medical Association, 515 E. High, Jefferson City, Mo. 65101.

SPECIALIST FAMILY PRACTICE—Generalist or surgeon. Town, 4000. 50 miles from Kansas City. Outstanding community. Large trade area. Airfield. Hospital. Radio. Good location for multiple specialty clinic. Brochure gives details. Large practice free. Long established. Retiring. Write Box 379, Missouri State Medical Association, 515 E. High, Jefferson City, Mo. 65101.

RADIOLOGIST—Board eligible, Diagnosis and Nuclear Medicine, 36, married, desires rural solo practice or association in Missouri. Telephone—AC 816-461-5243. Box 380, c/o Missouri State Medical Association, 515 E. High, Jefferson City, Mo. 65101.

EXCELLENT OPPORTUNITY—For board certified or board eligible anesthetist to locate in Kansas City, Mo. Call 816-923-9007 between 7 AM and 3:30 PM. St. Joseph Hospital.

IMMEDIATE CARE PHYSICIAN—No weekends or night call. $25,000 to start. One hour from Kansas City, Mo. Write Medical Director, Thompson, Brumm & Knepper Clinic, 902 Edmond St., St. Joseph, Mo. 64502.

LEO H. POLLOCK, M.D.

Missouri Medicine in Review

FORTY YEARS AGO

The Economic Survey Committee of the St. Louis Medical Society presented an exhaustive report to the Society at the meeting of December 13 on "Automobile Accidents and Emergency Treatment." It requests that the Missouri State Medical Association draft a bill for introduction in the 1933 session of the Legislature with the view of providing a reasonable assurance of payment of fees of physicians and hospitals for services rendered in emergencies resulting from automobile accidents. The Committee proposed that this protection take the form of a lien upon any moneys received by the person responsible for the accident as payment of liability damages. Lien laws to protect physicians and hospitals have been adopted in six states, namely, Delaware, Montana, Nebraska, New Jersey, Oregon and Virginia.

Dr. Harvey Jennett, Kansas City, was appointed superintendent of the Kansas City General Hospital on November 21. Doctor Jennett fills the vacancy created by the death of Dr. Porter E. Williams.

The appointments to the autopsy staff of Frank P. Furlong, newly-elected coroner of St. Louis, have been completed. The staff of nine physicians is composed of Drs. William J. Doyle, Ralph L. Thompson, Downey L. Harris, Eugene J. O'Malley, J. F. J. Nawrocki, E. C. O'Brien, John J. Connor, O. S. McClellan and L. A. Brandenburger. Coroner Furlong has announced a new policy of performing autopsies at the hospitals in which the patients die when legally possible so that interns may benefit from the proceedings.

Dr. E. M. Frommer, St. Joseph, has been notified by the Hungarian Society of Pathology that he has been awarded the Society's Schoenlein prize medal for 1932 for outstanding research work in cancer. While in Europe about a year ago, Doctor Frommer submitted a treatise to the Society entitled "The Role of Metaplastic Changes in the Pathology of Cancer."

TWENTY-FIVE YEARS AGO

Is cardiovascular disease an occupational hazard to physicians? Are doctors dying earlier now than formerly? To answer these questions, Reginald Fitz (Archives Internal Medicine, 76:210 [October] 1945) has studied the mortality tables for physicians found in the *Journal of the American Medical Association*. In his conclusions, which are interesting and offer a degree of comfort, he reveals that year by year, more physicians reach the age of 60. The total number living beyond 60 is increasing steadily, and a greater number reach 70 and 80. If deaths from cardiac, renal and cerebral vascular diseases are grouped, physicians between 40 and 60 years of age appear to die a little more commonly from these diseases than do members of the general white male population, probably because they have a better chance of avoiding earlier death from other causes. Fitz believes that as the profession grows larger and older, mortality from vascular disease will increase.

Frank J. Koenig, M.D., Kansas City, was elected president of the Missouri Association of Mental Hygiene at its annual meeting in Kansas City on November 17. G. W. Robinson, Jr., M.D., Kansas City, was elected vice-president.

The American Pharmaceutical Manufacturers' Association, New York, made its 1947 scientific award to the American Medical Association in recognition of its fundamental contributions to public health in the field of medical research. The award was made on nomination by a committee of 16 eminent scientists and was presented at a ceremony in the Waldorf Astoria Hotel in New York on December 16.

TEN YEARS AGO

When the 88th Congress convenes, it will have only three physicians in its membership. Dr. Durward G. Hall, Springfield (R-Mo.) and Dr. Thomas E. Morgan (D-Pa.) are returning to the House of Representatives. When the House convenes on January 9, Dr. James D. Weaver, Erie, Pa. (R-Pa.) will take oath for the first time. Doctor Weaver was one of seven physicians who were candidates for the first time and is the only one who was elected.

The St. Louis Medical Society's annual Beaumont Pilgrimage to the grave of Dr. William Beaumont in Bellefontaine Cemetery in St. Louis was made on November 21. The address was delivered by Brig. Gen. O. P. Hampton, Jr., M.C., St. Louis.

The Department of Health, Education and Welfare listed 25 new laws enacted by Congress in 1961-1962 which it felt were of major importance to the department. Those dealing with health were given as Public Law 87-781, which amended the Federal Food, Drug and Cosmetic Act to assure safety and effectiveness of drugs, to standardize names and to strengthen the authority of factory inspection.

The total number of students enrolled in medical schools for 1961-1962 was 31,078, which represents an increase of 790 students over the previous year and the largest increase for any one year since 1951, the report showed. Approval of the University of Colorado School of Medicine accounted for 355 of the 790 additional students.

*(Dr. Leo H. Pollock wishes to express his appreciation to Dr. Gertrude Lamb, medical librarian at the University of Missouri-Kansas City School of Medicine, for making available the reference books used in writing this column.—*Ed.)

MAFP Installs New Officers at Annual Assembly

Ben H. Koon, M.D., Bolivar, was installed as the 25th president of the Missouri Academy of Family Physicians at the Annual Scientific Assembly on Nov. 4, 1972 at the Lodge of the Four Seasons, Lake Ozark.

Other newly-elected officers of the Missouri Academy are Drs. Walter J. Stelmach, Kansas City, president-elect and Grover S. Patterson, Carthage, vice-president. Three Board of Director members who were elected are Drs. Irving H. Clark, Kansas City; David W. Hall, Springfield; and Lois C. Wyatt, St. Louis.

More than 200 Missouri family physicians and medical students attended the 1972 scientific session. The MAFP meeting also attracted officers from the Iowa, Illinois and Ohio Academies of Family Physicians.

Librium® and (chlordiazepoxide HCl) concomitant use

Librium (chlordiazepoxide HCl) is used as adjunctive antianxiety therapy concomitantly with certain specific medications of other classes of drugs, such as cardiac glycosides, antihypertensive agents, diuretics, anticholinergics and antacids.

Antianxiety effectiveness: Demonstrated in a broad range of psychologic and physical dysfunctions; indicated when reassurance and counseling are not enough and until, in the physici judgment, anxiety has been reduced to appropriate levels.

Effect on mental acuity: Usually mir proper maintenance dosage.

Safety: An excellent clinical record. I use, the most common side effects reporte been drowsiness, ataxia and confusion, p ularly in the elderly and debilitated.

in relief of clinically significant anxiety

Librium®

(chlordiazepoxide HCl)

5-mg, 10-mg, 25-mg capsules up to 100 mg daily in severe anxiety

Before prescribing, please consult complete product information, a summary of which follows:
Indications: Relief of anxiety and tension occurring alone or accompanying various disease states.
Contraindications: Patients with known hypersensitivity to the drug.
Warnings: Caution patients about possible combined effects with alcohol and other CNS depressants. As with all CNS-acting drugs, caution patients against hazardous occupations requiring complete mental alertness (e.g., operating machinery, driving). Though physical and psychological dependence have rarely been reported on recommended doses, use caution in administering to addiction-prone individuals or those who might increase dosage; withdrawal symptoms (including convulsions), following discontinuation of the drug and similar to those seen with barbiturates, have been reported. Use of any drug in pregnancy, lactation, or in women of childbearing age requires that its potential benefits be weighed against its possible hazards.
Precautions: In the elderly and debilitated, and in children over six, limit to smallest effective dosage (initially 10 mg or less per day) to preclude ataxia or oversedation, increasing gradually as needed and tolerated. Not recommended in children under six. Though generally not recommended, if combination therapy with other psychotropics seems indicated, carefully consider individual pharmacologic effects, particularly in use of potentiating drugs such as MAO inhibitors and phenothiazines. Observe usual precautions in presence of impaired renal or hepatic function. Paradoxical reactions (e.g., excitement, stimulation and acute rage) have been reported in psychiatric patients and hyperactive aggressive children. Employ usual precautions in treatment of anxiety states with evidence of impending depression; suicidal tendencies may be present and protective measures necessary. Variable effects on blood coagulation have been reported very rarely in patients receiving the drug and oral anticoagulants; causal relationship has not been established clinically.
Adverse Reactions: Drowsiness, ataxia and confusion may occur, especially in the elderly and debilitated. These are rever ble in most instances by proper dosage adjustment, but are also occasionally o served at the lower dosage ranges. In a few instances syncope has been report Also encountered are isolated instance skin eruptions, edema, minor menstru irregularities, nausea and constipation extrapyramidal symptoms, increased a decreased libido—all infrequent and generally controlled with dosage reduc tion; changes in EEG patterns (low-volt fast activity) may appear during and af treatment; blood dyscrasias (including agranulocytosis), jaundice and hepatic dysfunction have been reported occasi ally, making periodic blood counts and liver function tests advisable during pr tracted therapy.
Supplied: Librium® capsules containin 5 mg, 10 mg or 25 mg chlordiazepoxid HCl. Libritabs® tablets containing 5 mg 10 mg or 25 mg chlordiazepoxide.

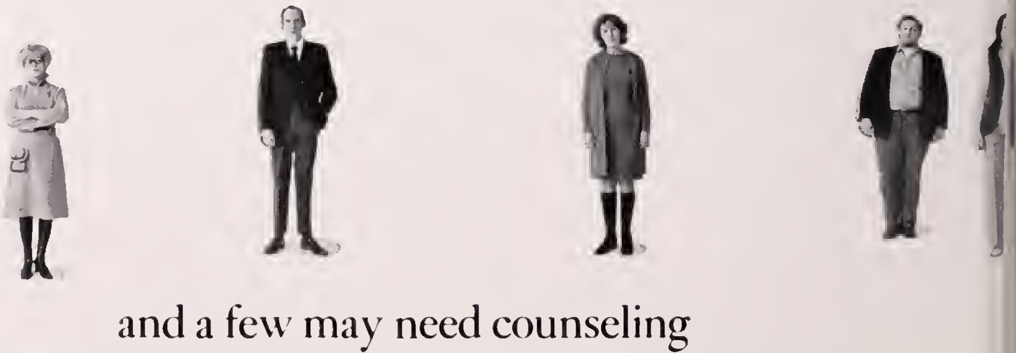
115th MSMA Annual Session
March 29-April 1, 1973 St. Louis

Everybody experiences psychic tension.

Most people can handle this tension.

Some people develop excessive psychic tension and need your counsel



and a few may need counseling
and the psychotropic action of Valium® (diazepam).

Before deciding to make Valium
izepam) part of your treatment
ı, check on whether or not the
ent is presently taking drugs
, if so, what his response has
n. Along with the medical and
al history, this information can
) you determine initial dosage,
possibility of side effects and
ultimate prospects of success
ilure.

While Valium can be a most
ful adjunct to your counseling,
ould be prescribed only as long
xcessive psychic tension per-
; and should be discontinued
n you decide it has accom-
hed its therapeutic task. In
eral, when dosage guidelines
followed, Valium is well
rated (see Dosage). For con-
ience it is available in 2-mg, 5-mg
10-mg tablets.

Drowsiness, fatigue and ataxia
e been the most commonly re-
ted side effects.

Until response is determined,
ents receiving Valium should
autioned against engaging in
ardous occupations requiring
nplete mental alertness, such
riving or operating machinery.

Before prescribing, please consult complete product information, a summary of which follows:

Indications: Tension and anxiety states; somatic complaints which are concomitants of emotional factors; psychoneurotic states manifested by tension, anxiety, apprehension, fatigue, depressive symptoms or agitation; symptomatic relief of acute agitation, tremor, delirium tremens and hallucinosis due to acute alcohol withdrawal; adjunctively in skeletal muscle spasm due to reflex spasm to local pathology, spasticity caused by upper motor neuron disorders, athetosis, stiff-man syndrome, convulsive disorders (not for sole therapy).

Contraindicated: Known hypersensitivity to the drug. Children under 6 months of age. Acute narrow angle glaucoma; may be used in patients with open angle glaucoma who are receiving appropriate therapy.

Warnings: Not of value in psychotic patients. Caution against hazardous occupations requiring complete mental alertness. When used adjunctively in convulsive disorders, possibility of increase in frequency and/or severity of grand mal seizures may require increased dosage of standard anticonvulsant medication; abrupt withdrawal may be associated with temporary increase in frequency and/or severity of seizures. Advise against simultaneous ingestion of alcohol and other CNS depressants. Withdrawal symptoms (similar to those with barbiturates and alcohol) have occurred following abrupt discontinuance (convulsions, tremor, abdominal and muscle cramps, vomiting and sweating). Keep addiction-prone individuals under careful surveillance because of their predisposition to habituation and dependence. In pregnancy, lactation or women of childbearing age, weigh potential benefit against possible hazard.

Precautions: If combined with other psychotropics or anticonvulsants, consider carefully pharmacology of agents employed; drugs such as phenothiazines, narcotics, barbiturates, MAO inhibitors and other antidepressants may potentiate its action. Usual precautions indicated in patients severely depressed, or with latent depression, or with suicidal tendencies. Observe usual precautions in impaired renal or hepatic function. Limit dosage to smallest effective amount in elderly and debilitated to preclude ataxia or oversedation.

Side Effects: Drowsiness, confusion, diplopia, hypotension, changes in libido, nausea, fatigue, depression, dysarthria, jaundice, skin rash, ataxia, constipation, headache, incontinence, changes in salivation, slurred speech, tremor, vertigo, urinary retention, blurred vision. Paradoxical reactions such as acute hyperexcited states, anxiety, hallucinations, increased muscle spasticity, insomnia, rage, sleep disturbances, stimulation have been reported; should these occur, discontinue drug. Isolated reports of neutropenia, jaundice; periodic blood counts and liver function tests advisable during long-term therapy.

Dosage: Individualize for maximum beneficial effect. *Adults:* Tension, anxiety and psychoneurotic states, 2 to 10 mg b.i.d. to q.i.d.; alcoholism, 10 mg t.i.d. or q.i.d. in first 24 hours, then 5 mg t.i.d. or q.i.d. as needed; adjunctively in skeletal muscle spasm, 2 to 10 mg t.i.d. or q.i.d.; adjunctively in convulsive disorders, 2 to 10 mg b.i.d. to q.i.d. *Geriatric or debilitated patients:* 2 to 2½ mg, 1 or 2 times daily initially, increasing as needed and tolerated. (See Precautions.) *Children:* 1 to 2½ mg t.i.d. or q.i.d. initially, increasing as needed and tolerated (not for use under 6 months).

Supplied: Valium® (diazepam) Tablets, 2 mg, 5 mg and 10 mg; bottles of 100 and 500. All strengths also available in Tel-E-Dose® packages of 1000.

Information for Contributors

Articles are accepted for publication on condition that they are contributed solely to this journal. Material appearing in Missouri Medicine is protected by copyright. Permission will be granted on request for reproduction in reputable publications provided proper credit is given and author gives permission.

Manuscripts should be typewritten, double spaced, and the original with one carbon copy submitted. Retain another carbon copy for proofreading. Used manuscripts are not returned. School and hospital appointments of the author should accompany the manuscript. It is desirable that a synopsis-abstract of approximately 135 words accompany the manuscript. References should be arranged at the end of the article in the order in which the references are cited in the text. The reference should give name of author, title of article, name of periodical, volume number, initial page number and year. Authors are responsible for reference accuracy.

Illustrations should be glossy prints or drawings in India ink on white paper. They should not be mounted and name of author and figure number should be penciled lightly on the backs. Legends should appear on a separate sheet. Colored illustrations will be used when suitable if author assumes the actual cost.

Legal difficulties may arise from unauthorized use of names, initials or photographs in which individuals can be identified. Permission should be secured from patient or legal guardian and signed duplicate or photostat submitted with such photographs or identification. The Editor and Editorial Board assume no responsibility for the opinions and claims expressed in articles contributed by authors. If citation of an institution related to the article is made, approval of the chief of service should be given in a letter accompanying the article.

Reprint order blanks will accompany proof, which will be sent to authors prior to publication.

All material other than scientific should be received prior to the first of the month preceding month of publication.

Please give notice of change of address at least one month in advance of the change, giving old and new addresses.

Why send him to the islets of Langerhans?

Since sulfonylureas promote the release of
sulin which is lipogenic and helps transport
ucose into adipose tissue…

And since many overweight patients already
ave normal or high levels of endogenous insulin,
hy not consider DBI-TD?

It lowers blood sugar without stimulating insulin secretion from the pancreas. And this may be important to the dieting diabetic.

In adult-onset, nonketotic diabetics uncontrolled by diet alone…

DBI-TD® Geigy
phenformin HCl

lowers blood sugar without raising blood insulin.

I® phenformin HCl
blets of 25 mg.
I-TD® phenformin HCl
ned-Disintegration
psules of 50 and 100 mg.
lications: Stable adult diabetes
llitus; sulfonylurea failures,
mary and secondary; adjunct to
ulin therapy of unstable diabetes
llitus.
ntraindications: Diabetes mellitus
t can be regulated by diet alone;
enile diabetes mellitus that is
complicated and well regulated on
ulin; acute complications of
betes mellitus (metabolic acidosis,
na, infection, gangrene); during
immediately after surgery where
ulin is indispensable; severe
patic disease; renal disease with
mia; cardiovascular collapse
ock); after disease states
ociated with hypoxemia.

Warnings: Use during pregnancy is to be avoided.
Precautions: 1. *Starvation Ketosis:* This must be differentiated from "insulin lack" ketosis and is characterized by ketonuria which, in spite of relatively normal blood and urine sugar, may result from excessive phenformin therapy, excessive insulin reduction, or insufficient carbohydrate intake. Adjust insulin dosage, lower phenformin dosage, or supply carbohydrates to alleviate this state. **Do not give insulin without first checking blood and urine sugar.**
2. *Lactic Acidosis:* This drug is not recommended in the presence of azotemia or in any clinical situation that predisposes to sustained hypotension that could lead to lactic acidosis. To differentiate lactic acidosis from ketoacidosis, periodic determinations of ketones in the blood and urine should be made in diabetics previously stabilized on phenformin, or phenformin and insulin, who have become unstable. If electrolyte imbalance is suspected, periodic determinations should also be made of electrolytes, pH, and the lactate-pyruvate ratio. The drug should be withdrawn and insulin, when required, and other corrective measures instituted immediately upon the appearance of any metabolic acidosis.
3. *Hypoglycemia:* Although hypoglycemic reactions are rare when phenformin is used alone, every precaution should be observed during the dosage adjustment period particularly when insulin or a sulfonylurea has been given in combination with phenformin.
Adverse Reactions: Principally gastrointestinal; unpleasant metallic taste, continuing to anorexia, nausea and, less frequently, vomiting and diarrhea. Reduce dosage at first sign of these symptoms. In case of vomiting, the drug should be immediately withdrawn. Although rare, urticaria has been reported, as have gastrointestinal symptoms such as anorexia, nausea and vomiting following excessive alcohol intake.
(B) 98-146-103-D (6/72)

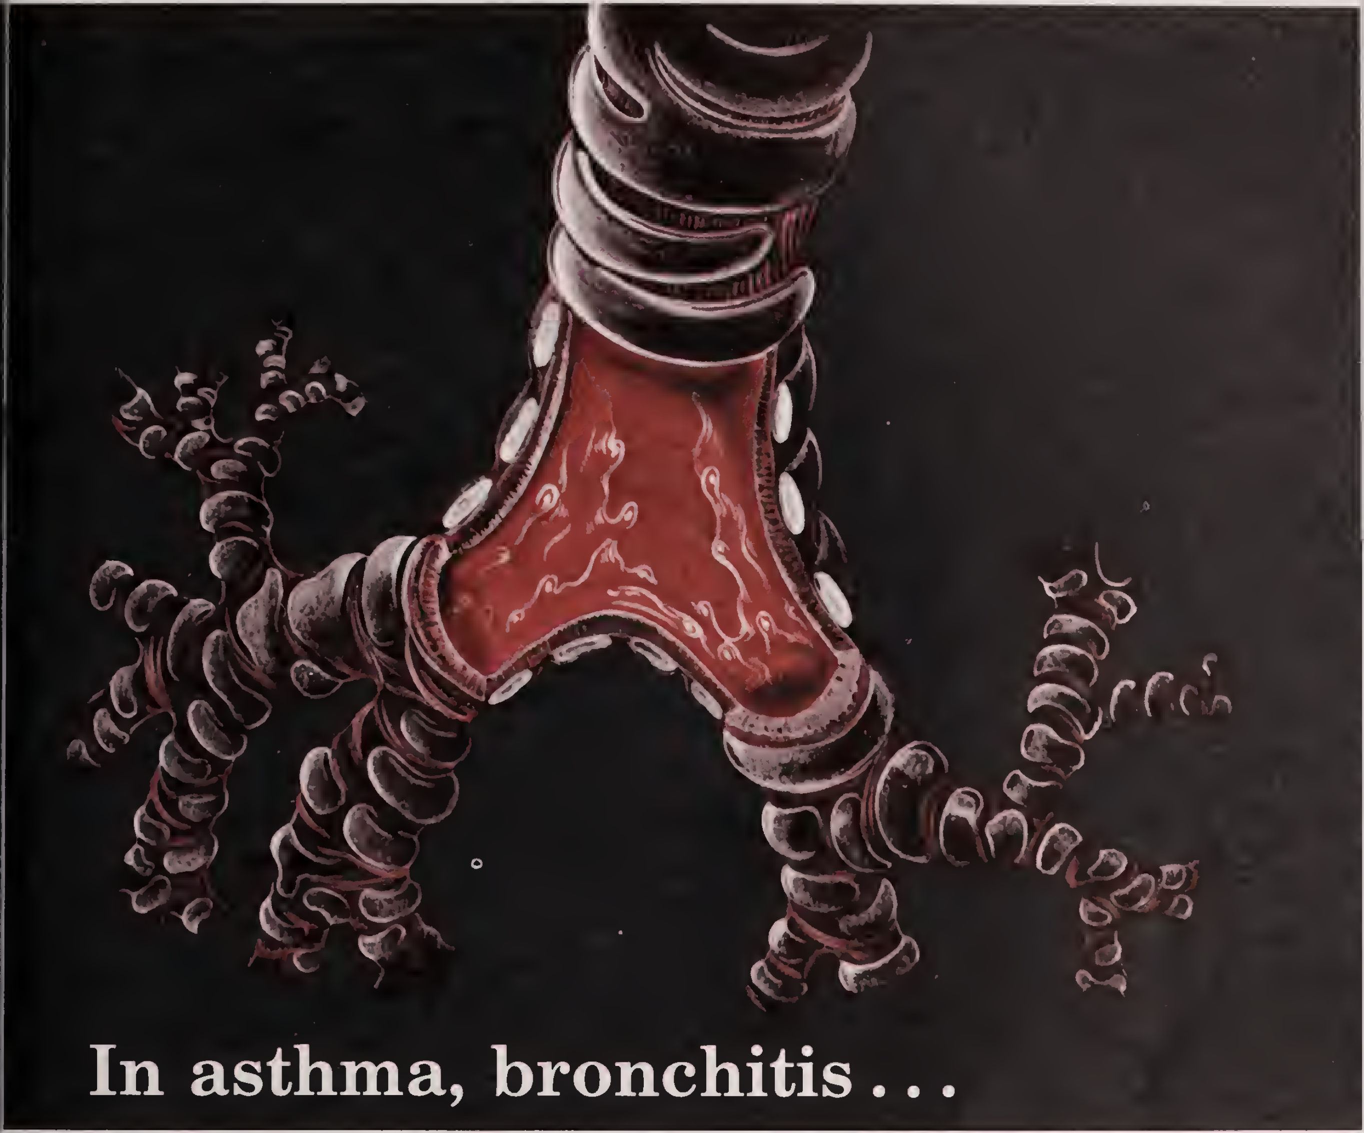
OVE-OUT STICKY MUCUS...



"Many physicians use iodides intravenously when they suspect that the main reason for airway obstruction is sticky mucus but oral iodides are more likely to exert an expectorant action."[1]

"For the viscid sputum, potassium iodide (. . . preferable as enteric coated tablets) may be best."[2]

Provide tastefree, well-tolerated KI in convenient SLOSOL coated tablets—

IODO-NIACIN®

Each SLOSOL coated tablet contains potassium iodide 135 mg. and niacinamide hydroiodide 25 mg.

COLE

please see next page for prescribing information—

Promote Productive Cough-

"The productive cough serves the necessary purpose of removing excess mucus from the bronchial tree."[3]

". . . there is clear evidence that the loosening of the bronchial mucus blanket must begin from within the underlying mucus glands where it is anchored and not from the surface. Complications of iodides are too occasional to avoid the use of this valuable medication."[3]

Rx Information:

INDICATIONS: The primary indication for Iodo-Niacin is in any clinical condition where iodide therapy is desired. All of the usual indications for the iodides apply to Iodo-Niacin and include:

RESPIRATORY DISEASE: The use of Iodo-Niacin is indicated whenever an expectorant action is desired to increase the flow of bronchial secretion and thin out tenacious mucus as seen in bronchial asthma, and other chronic pulmonary disease. Iodo-Niacin has also proven of value in sinusitis, bronchitis, bronchiectasis, and other chronic and acute respiratory diseases where the expectorant action of iodide is desired.

THYROID DISEASE: Iodo-Niacin is indicated in any thyroid disorder due to iodine deficiency, such as endemic goiter or hypoplastic goiter, and where hypothyroidism is secondary to iodine deficiency. Iodo-Niacin will suppress mild hyperthyroidism completely, and partially suppress more severe hyperthyroid states. Iodo-Niacin is also of value in suppressing the symptoms of hyperthyroidism and decreasing the size and vascularity of the thyroid gland prior to thyroidectomy.

ARTERIOSCLEROSIS: Iodides have been reported as relieving some of the symptoms associated with arteriosclerosis. The mechanism of action is unknown, but the effects are documented.

OPHTHALMOLOGY: Iodo-Niacin has been reported to be of value in retinal and vitreous hemorrhages. The mechanism of action is unknown, but absorption of the hemorrhagic areas has been observed following use of this drug. It is also reported to be of value in reducing or removing vitreous floaters.

SIDE EFFECTS: Serious adverse side effects from the use of Iodo-Niacin are rare. Mild symptoms of iodism such as metallic taste, skin rash, mucous membrane ulceration, salivary gland swelling, and gastric distress have occurred occasionally. These generally subside promptly when the drug is discontinued. Pulmonary tuberculosis is considered a contraindication to the use of iodides by some authorities, and the drug should be used with caution in such cases. Rare cases of goiter with hypothyroidism have been reported in adults who had taken iodides over a prolonged period of time, and in newborn infants whose mothers had taken iodides for prolonged periods. The signs and symptoms regressed spontaneously after iodides were discontinued. The causal relationship and exact mechanism of action of iodides in this phenomenon are unknown. Appropriate precautions should be followed in pregnancy and in individuals receiving Iodo-Niacin for prolonged periods.

DOSAGE: The oral dose for adults is two tablets after meals taken with a glass of water. For children over eight years, one tablet after meals with water. The dosage should be individualized according to the needs of the patient on long-term therapy.

HOW SUPPLIED: Cole's Iodo-Niacin tablets are available in bottles of 100, 500 and 1,000. Slosol coated pink. NDC 55-6458.

IODO-NIACIN®

Each SLOSOL tablet contains potassium iodide 135 mg. and niacinamide hydroiodide 25 mg. Sig. *ij* tabs. t.i.d. p.c.

Friday, March 30

8:00 AM Registration.
9:00 AM General Session.
Introduction: Walter T. Gunn, M.D., St. Louis, MSMA President.
Speakers: Congressman James W. Symington, D-Missouri.
Congressman Tim Lee Carter, R-Kentucky.
10:30 AM Intermission to view exhibits.
10:30 AM *Clinical Allergy—Diagnosis and Treatment.*
Presiding: William T. K. Bryan, M.D., St. Louis, President, Missouri State Allergy Association.
Participants:
Welcome and Introduction, William T. K. Bryan, M.D.
Diagnostic Tests in Allergic Disease, Raymond G. Slavin, M.D., Associate Professor of Internal Medicine and Chief, Section of Allergy and Immunology, St. Louis University School of Medicine, St. Louis.
Hyposensitization, Ralph Hale, M.D., Department of Medicine, Wesley Medical Center and St. Joseph Hospital, Wichita, Kan.
Food Allergy in Alcoholics, George A. Ulett, M.D., Professor and Chief, Department of Psychiatry, University of Missouri School of Medicine, St. Louis.
Sponsored by Missouri State Allergy Association.
*11:00 AM *Newer Techniques in the Diagnosis and Treatment of Thyroid Disease.*
Moderator: Thomas F. Frawley, M.D., St. Louis.
Panel Participants:
John Lindeman, M.D., St. Louis.
Garrett Hagen, M.D., St. Louis.
Lewis Chase, M.D., St. Louis.
Sponsored by Missouri Society of Internal Medicine and the Missouri Chapter, American College of Physicians.
*11:00 AM *Newer Aids in the Diagnosis of Connective Tissue Disease*, John D. Arnold, M.D., Kansas City.
Newer Treatments in Connective Tissue Disease, Jack Zuckner, M.D., St. Louis.
Sponsored by Missouri Society of Internal Medicine and the Missouri Chapter, American College of Physicians.
*11:00 AM *Developmental Dyslexia and a Rational Approach to Management*, Norman E. Silberberg, Ph.D., Director of Research and Program Development, Kenny Rehabilitation Institute, Minneapolis, Minn.
Moderator: Warren A. Weinberg, M.D., St. Louis.
Panel Discussants:
Philip R. Dodge, M.D., Professor and Chairman, Department of Pediatrics and Professor of Neurology, Washington University School of Medicine, St. Louis.
Richard Burnett, Ed.D., Professor of Education and Director of the Reading Clinic, University of Missouri-St. Louis.
Warren A. Weinberg, M.D., Assistant Professor, Department of Pediatrics and Neurology, Washington University School of Medicine, St. Louis.
Manic-Depressive Illness in Children: Recognition and Treatment, Warren A. Weinberg, M.D., St. Louis.
Sponsored by Missouri Chapter, American Academy of Pediatrics.

---

* Concurrent Sessions.

°11:00 AM *Psychiatric Sequelae of Vasectomy.*
Moderator: Ralph L. Biddy, M.D., St. Louis.
Panel Participants:
I. M. Thompson, M.D., Professor and Chief, Department of Urology, University of Missouri, Columbia.
Gilbert Ross, Jr., M.D., Department of Urology, University of Missouri, Columbia.
(Additional panelists to be announced.)
Sponsored by Missouri Psychiatric Association and Missouri Academy of Psychiatry.

°11:00 AM *Program on Surgery,* Sponsored by Missouri State Surgical Society.

12:30 PM Missouri University Alumni Luncheon.
Youth and School Committee, Missouri Chapter, American Academy of Pediatrics Luncheon. (Open to all physicians.)
Missouri Academy of Psychiatry Luncheon.
Maternal Welfare Luncheon. Missouri Obstetrical-Gynecological Society.

° 2:00 PM *Clinical Allergy—Diagnosis and Treatment* (Continued).
Presiding: Orval R. Withers, M.D., Clinical Professor of Medicine Emeritus, University of Kansas School of Medicine, Kansas City, Kan.
Participants:
37 Years of ENT Allergy, George E. Shambaugh, Jr., M.D., Emeritus Professor of Otolaryngology, Northwestern University School of Medicine, Chicago, Ill.
Allergic Middle Ear Disease, Jack D. Clemis, M.D., Associate Professor of Otolaryngology, Northwestern University School of Medicine, Chicago, Ill.
The Effect of Allergy on the Nervous System, Frederic Speer, M.D., Director, Pediatric Allergy, University of Kansas Medical Center, Kansas City, Kan.
Adrenergic Theory of Bronchial Asthma, Charles W. Parker, M.D., Professor of Medicine, Division of Immunology, Washington University School of Medicine, St. Louis.
Panel—Entire Faculty—Allergy—Questions and Answers.
Moderator: James W. Willoughby, M.D., Lecturer in Medicine, University of Missouri-Kansas City School of Medicine.
Sponsored by Missouri State Allergy Association.

° 2:00 PM *The Management of Chronic Renal Failure.*
Moderator: John Maher, M.D., Columbia.
Panel Participants:
Robert Cuddihee, M.D., St. Louis.
Herbert Lubowitz, M.D., St. Louis.
Thomas T. Crouch, M.D., Kansas City.
Sponsored by Missouri Society of Internal Medicine and the Missouri Chapter, American College of Physicians.

° 2:00 PM *Hypoglycemic Agents Revisited,* Marvin E. Levin, M.D., Assistant Professor, Clinical Medicine, Washington University School of Medicine, St. Louis.
Hyperlipidemia: Its Significance and Management, Neville Grant, M.D., Assistant Professor, Clinical Medicine, Washington University School of Medicine, St. Louis.
Sponsored by Missouri Society of Internal Medicine and the Missouri Chapter, American College of Physicians.

° 2:00 PM *Abdominal Pain and Multiple Surgery—A Psychosomatic Condition?*
Moderator: Ralph L. Biddy, M.D., St. Louis.
Panel Participants:
David Davis, M.D., Professor of Psychiatry and Associate Chairman, Department of Psychiatry, University of Missouri School of Medicine, Columbia.
Richard T. Quick, M.D., Assistant Professor of Psychiatry, St. Louis University, St. Louis.
Richard L. Sterkel, M.D., Gastroenterologist, St. Louis.
W. E. Bazzoui, M.D., Clinical Director, Mid-Missouri Mental Health Center, Columbia.
Sponsored by Missouri Psychiatric Association and Missouri Academy of Psychiatry.

° 2:00 PM Program on Surgery Sponsored by Missouri State Surgical Society.
3:30 PM Intermission to view exhibits.
4:00 PM **House of Delegates,** second session.
5:30 PM Missouri State Medical Foundation Annual Meeting.
6:00 PM Reference Committee Meetings.
6:00 PM Dinner Meeting: Missouri State Allergy Association.

° Concurrent Sessions.

6:30 PM Dinner Meetings:
Missouri Psychiatric Association and Missouri Academy of Psychiatry.
Speaker: Warren Williams, M.D., Speaker-Elect, Assembly of District Branches of the American Psychiatric Association, Tucson, Ariz.
Subject: *"The Structure, Objectives and Current Alternatives for the APA."*
Missouri State Surgical Society—University Club.

Saturday, March 31

8:00 AM Registration
* 9:00 AM *Whither Medicine.*
Moderator: Maxwell G. Berry, M.D., Kansas City.
Participants:
Assurance of Quality by Knowledge and Performance or—How Else?, Edward C. Rosenow, Jr., M.D., Executive Vice-President, American College of Physicians, Philadelphia, Pa.
Dynamic Reform in Graduate Education and Credentialing, Robert A. Chase, M.D., Chairman, Graduate Education Committee, American College of Surgeons and Emile Holman Professor of Surgery and Chairman, Department of Surgery, Stanford University School of Medicine, Stanford, Calif.
The New Economics of Health Care, William B. Hildebrand, M.D., Chairman, Council on Medical Services, American Medical Association, Menasha, Wis.
* 9:00 AM *Postoperative Respiratory Care*, Henrik Bendixen, M.D., Professor and Chairman, Department of Anesthesia, University of California, San Diego, Calif.
Moderator: Robert W. Vaughan, M.D., St. Louis.
Sponsored by Missouri Society of Anesthesiologists.
10:30 AM Intermission to view exhibits.
10:30 AM *Health Care Team Concept—Spinal Cord Injury System.*
Moderator: Saul Boyarsky, M.D., St. Louis.
Participants:
Franz U. Steinberg, M.D., Chief of Physical Medicine and Rehabilitation, Jewish Hospital and Assistant Professor of Medicine, Washington University School of Medicine, St. Louis.
Simon Horenstein, M.D., Professor and Chairman, Department of Neurology, St. Louis University School of Medicine, St. Louis.
Henry G. Schwartz, M.D., Professor and Head, Division of Neurosurgery, Washington University School of Medicine, St. Louis.
Saul Boyarsky, M.D., Professor and Head of Division of Urological Surgery, Washington University School of Medicine.
(With invited discussants)
*11:00 AM *Medicine, Surgery, Anesthesia and Hepatitis*, David M. Little, Jr., M.D., Staff Anesthesiologist, Hartford Hospital, Hartford, Conn.
Moderator: Robert W. Vaughan, M.D., St. Louis.
Sponsored by Missouri Society of Anesthesiologists.
*11:00 AM *Symposium on Chemotherapy.*
Moderator: Andrew McCanse, M.D., Kansas City.
Participants:
Joel L. Zeffren, M.D., St. Louis.
Virgil Loeb, Jr., M.D., St. Louis.
Reginald P. Pugh, M.D., Columbia.
Sponsored by Missouri Division, American Cancer Society.
*11:00 AM *Newer Approaches to the Management of Coronary Artery Disease.*
Moderator: G. Charles Oliver, M.D., St. Louis.
Panel Participants:
Alexander S. Geha, M.D., St. Louis.
J. Gerard Mudd, M.D., St. Louis.
Jon Cooksey, M.D., Assistant Professor of Preventive Medicine and Medicine, Washington University School of Medicine, St. Louis.
Richard B. Whiting, M.D., Assistant Professor of Medicine, St. Louis University School of Medicine, St. Louis.
Sponsored by Missouri Society of Internal Medicine and the Missouri Chapter, American College of Physicians.
*11:00 AM *The Problem of Diabetic Retinopathy*, Francis A. L'Esperance, M.D., Assistant Professor of Clinical Ophthalmology, Columbia University College of Physicians and Surgeons and Director of John A. Hartford Laser Laboratory, New York, N. Y.

---

* Concurrent Sessions.

Moderator: Anwar Shah, M.D., St. Louis.
Panel Discussants:
Isaac Boniuk, M.D., St. Louis.
King Y. Lee, M.D., Assistant Clinical Professor of Ophthalmology, University of Missouri, Kansas City.
Anwar Shah, M.D., St. Louis.
Sponsored by the Missouri Ophthalmological Society, Inc.

*11:00 AM Physician Fees.
(Participants to be announced.)

12:30 PM **MSMA General Luncheon.**
Guest Speaker—James H. Sammons, M.D., Vice Chairman, Board of Trustees, American Medical Association, Baytown, Tex.
Fifty-Year Club Luncheon.
Missouri Ophthalmological Society, Inc., Luncheon.
Missouri State Society of Neurological Surgeons Luncheon.
Physiatrists Luncheon.

1:30 PM *Diagnostic Radiology in Obstetrics and Gynecology,* Lawrence A. Pilla, M.D., Assistant Clinical Professor of Radiology, St. Louis University, St. Louis. (This program is of general interest.)
Moderator: William H. McAlister, M.D., St. Louis.
Sponsored by Missouri Radiological Society.

* 2:30 PM *Cutaneous Manifestations of Internal Disease,* W. Mitchell Sams, Jr., M.D., Professor and Head, Division of Dermatology, University of Colorado Medical Center, Denver, Colo.
Moderator: Norman Asel, M.D., Columbia.
Sponsored by Missouri Dermatological Society, Inc.

* 2:30 PM *Cerebrovascular Disease and the Management of the Post-Phlebitic Extremity.*
Moderator: Albert M. Estes, M.D., Cape Girardeau.
Participants:
Pathogenesis and Diagnosis of Cerebral Ischemia, William S. Fields, M.D., Professor of Neurology, University of Texas Medical School, Houston, Tex.
Surgical Management of Cerebrovascular Insufficiency, Jesse E. Thompson, M.D., Clinical Professor of Surgery, University of Texas Southwestern Medical School, Dallas, Tex.
The Management of the Post-Phlebitic Extremity, Charles R. Doyle, M.D., Professor of Clinical Surgery, St. Louis University School of Medicine, St. Louis.
Sponsored by Missouri Heart Association, Inc.

* 2:30 PM *Program on Surgery,* Sponsored by Missouri State Surgical Society.

* 2:30 PM Value of Periodic Physical Examinations.
(Participants to be announced.)

* 2:30 PM Physician Assistant.
(Participants to be announced.)

3:00 PM *Radiology of Total Hip Replacement,* Tom W. Staple, M.D., Associate Professor of Radiology, Mallinckrodt Institute of Radiology, Washington University School of Medicine, St. Louis.
A Roentgen Approach to GI Obstruction in Children, Gary D. Shackelford, M.D., Instructor in Radiology, Mallinckrodt Institute of Radiology, Washington University School of Medicine, St. Louis.
Necrotizing Enterocolitis, John C. Leonidas, M.D., Kansas City.
Moderator: William H. McAlister, M.D., St. Louis.
Sponsored by Missouri Radiological Society.

4:00 PM Intermission to view exhibits.
5:00 PM St. Louis University Medical Alumni Cocktail Party.
5:00 PM Washington University Medical Alumni Cocktail Party.
Missouri Dermatological Society, Inc., Cocktails and Dinner (Courtesy of Westwood Pharmaceuticals)—St. Louis Club, Pierre Laclede Center, 7701 Forsyth, Clayton.
6:30 PM Social Hour for those Attending Banquet.
7:15 PM Annual Banquet in Honor of Past-Presidents.

Sunday, April 1

7:30 AM House of Delegates, breakfast and final session.
Autoimmune Dermatologic Diseases, W. Mitchell Sams, Jr., M.D., Professor and Head, Division of Dermatology, University of Colorado Medical Center, Denver, Colo.—Wohl Clinic, 5th Floor, Washington University School of Medicine, 4950 Audubon.
Sponsored by Missouri Dermatological Society, Inc.

---

* Concurrent Sessions.

Medicine Over There?

Local Society Goes to the Experts

JOHN JOHNSTONE, M.D., ***St. Louis***

"Probably the most important tool of the committee is the general experience of its members: their familiarity with their country of origin, their ability to discern what is going on beneath the surface among the people of their homeland." Originally published in Private Practice, *this article reports a unique approach to gaining informed opinions about "comparative health care delivery" by an Ad Hoc Committee of Foreign-Born Physicians of the St. Louis Medical Society.*

Although 1971 promised to be a year of much discussion, both in the Congress and in the nation at large, about health care delivery, the foreign-born physicians in our midst seemed to be largely untapped as a source of data and of informed opinion on the whole subject of "comparative health care delivery." With the aim of tapping this source and of pooling and using the experience of people who have lived with more than one health care delivery system, Dr. Lawrence W. O'Neal, then president of the St. Louis Medical Society, established an ad hoc committee of foreign-born physicians practicing in St. Louis. The committee met for the first time in May of last year.

Many of the health care proposals now before the nation have their counterparts actually operating in other countries. It seemed important, therefore, to explore the development of these successes and failures—and thus to maximize the good and steer clear of the bad in our own country.

There has been no identical parallel between any two countries, but there have been similarities—"syndromes," "side-effects," "epidemiology," loopholes and malfunctioning. The hope of the committee was to delineate these similarities and inform the doctors, the community and the nation in a constructive way. There have also been "prodromals," underlying circumstances and developments in a nation's life and history at large, which tended to foster or discourage this or that health care system. All this the committee hoped to assimilate, to digest and to spell out in usable form—showing why, for example, if a program worked in Germany, it wouldn't work in Italy; or why, if it worked in both Germany and Italy, it wouldn't work in England; or why, if it worked in Italy in 1950, it does or doesn't work there in 1972.

Probably the most important tool of the committee is the general experience of its members: their familiarity with their country of origin, their ability to discern what is going on beneath the surface among the people of their homeland. Fluency in the language, keeping up with literature and radio reports, contacts by mail, visitors from home and trips back home kept our members knowledgeable about the current state of affairs in their particular homelands.

A typical meeting of our committee would have, for example, a member from West Germany explaining the West German system—the system's historical development, its effects on the community, what a physician might do in this or that situation, what a patient might do, what a nurse or pharmacist or hospital administrator might do, what the federal financing and rule-making "third party" might do. From time to time, a round-table repartee would spring up as a physician from another country would interject, "In my country it wouldn't happen like that, but would happen like this: . . ." Then an illustrative anecdote might be presented, and a contrasting one, illustrating a typical happening in some third country, might follow. Sometimes the speaker would be a guest rather than a regular member. Some guests have been physicians, and some have been laymen. We decided to tape our meetings and to have them transcribed. We are building a reference bibliography, tapes, etc., and have recently begun public appearances and broadcasts as we have reached the point where we can speak with some authority to the public.

We think a committee like ours is worth establishing elsewhere around the country; if others exist, we would like to be in touch with them.

Our committee also has native American members. For, as one foreign-born member said, "I've been in America for 20 years, and there are still plenty of things that I don't understand about Americans." Native-born members supply, where needed, that same element of understanding about the U. S. that immigrant members supply about their country of origin.

What have we learned so far? For one thing, we have learned that no two countries are alike. Each has its own tradition, its own history and expression, its own factions and subgroups, its own personalities and leaders, which would help explain why a particular system works or does not work, and why, when you "transplant" a system from country A to country B, you get a "take" or a "rejection" by the "host" country.

We have learned that a monopolist Establishment for health care works poorly compared to our pluralist "non-system," has much inertia, and that once something is legislated, you're likely to be stuck with it for a long time, with no prompt internal tendency for self-improvement and correction.

With rights go responsibilities, but in the foreign systems that we have studied, the patients have rights but no responsibilities and the physicians have responsibilities but few or no rights. The third party, the State, is supposed to regulate this potential for imbalance, but it fails to do so, and the systems become unwieldy, routinized, and mediocre.

We have learned that in some countries, a person need not fear lack of medical care because he lacks money—no small comfort, yet with sacrifice of other boons. We have learned that in country after country, from Russia to England, VIPs get superior medical care and personalized attention while the mass of people stand in line and get "clinic" type care. While it is true that in the U. S. persons of privilege have access to better care (just as in all other countries), the percentage of Americans with this access is much higher than anywhere else. In Italy, top medical care is available to around 3% (the wealthy) and in the USSR to around 5% (the Party elite and higher officials).

We have learned that the intimate doctor-patient relationship is repugnant to Communist governments because it encourages private secret-keeping which thwarts the re-tailoring of society.

We have had the opportunity to learn about the day-to-day practice of medicine under various systems. Take, for example, the management of myocardial infarction in England:

In England, we learned, a high percentage of myocardial infarctions are treated in the home, without benefit of EKG or enzyme levels. Very few British GPs have EKG machines in their offices, nor do they feel financially able to buy them, nor do they have the incentive to become proficient in the use of them. If a patient is obviously too sick to be cared for at home, he passes out of the GP's hands (except in rural areas) to go to the hospital. There, in the hands of specialists, he gets the coronary care that we know here. All those "not so sick" cases who suddenly go into an arrythmia and would be salvaged on a monitor in coronary care units in the U. S. simply take their chances at home if they live in England.

The English GP, we learned, sees patients on office visits averaging three minutes per visit and refers them to specialists if they require more diagnostic time and study than that. Thus, the English GP comes to be more and more of an in-take screening station, with less and less experience in managing many types of cases. Our committee members and guest speakers have repeatedly likened the competence and know-how of the European GP to that of an RN in the U. S.

These observations are particularly true concerning medicine in England, West Germany, Austria, Italy and, to a lesser extent, Switzerland —with all of which we have had some modicum of first-hand contact. One of our members is now teaching in Australia, and we look forward to hearing from him on his return. We know of Canadian medicine only through coverage in the press—especially concerning the situations in Quebec[1] and Saskatchewan.[2] We know locally no physicians from Canada who are in touch with the current health care scene in Canada.

. We know about Scandinavian medicine only indirectly. We have no physicians available to us who have emigrated from Scandinavia. Does this mean that physicians in Scandinavia like it so well that they don't emigrate? Is theirs the system we need, and would it work here? The answer to these questions is probably No (see Biörek[3]), but we would like to know much more and would be grateful for contact with sister committees which have member physicians from Scandinavia. We would also like first hand information about medicine in France, Israel, Mexico and the Benelux countries. (Other countries, such as the Philippines, Thailand, India, Pakistan and Iran, have substantially different contexts, and their experience does not seem applicable to the U. S.).

Social insurance, including government-financed medical insurance, began in Bismarck's Prussia in the 1880s, and from there spread to other countries with autocratic regimes—Austria-Hungary, Czarist Russia, Portugal, Romania. (Palyi, p. 143) It was only later that it began to be advocated in democratic countries undergoing industrialization—and for a complex interplay of reasons. A person's conception of how health care should be provided does not exist in a vacuum unrelated to his other attitudes—about economics, politics, society, technology, religion, life and death in general.

Repeatedly, Socialist governments have come to power and "solved" the "problem" of physicians as a "class," without distinction as to good, bad, or mediocre individuals among them, without consulting the physicians, without knowing what ethics, invisibly pledged in terms of Hippocratic or Talmudic or Gospel precepts, might inwardly govern the particular physician. Medicine as a "class" thereafter has unfailingly become mediocritized, because its ethical responsibility has been forcibly changed to an "ethic" responsible to "the people" as a class to the "health care consumer" as a class, to the State, or the Party, or the Ministry of Health, or the Regional Health Supervisor.

Bismarck was the author of modern state medicine. The old craft guilds had previously supplied medical insurance to their membership, and had been (to Bismarck) unpleasantly powerful and independent. These guilds were on their way out, and Bismarck hoped that by supplying that function himself he could curtail the power of the newly emerging industrial magnates and unions.

Lenin admired Bismarck's administrative system very much and imitated it in setting up his Socialist Soviet administration—but for different purposes. The idea was to have no center of power or thought independent of the State.

The results of these concepts can be seen in the various systems set up in various countries during the past three-quarters of a century.

It is hardly possible, without awareness of these historical roots and ideological backgrounds, to grasp the currents and developments of which "health care delivery" formulas are but one manifestation. Palyi[4] sketches well the historical scope of state involvement in health care and gives good bibliography for getting into the writings of those friendly and those unfriendly to it. These historical backgrounds are woven into the experience of our committee members.

Comment by Joseph C. Ungvari, M.D., St. Louis:

There are some points upon which most if not all members of the committee agree. They all came to this country of their own free will, rather than from political pressure or economic need. They had reasonably good incomes in their native countries. When they came here, they were not motivated by desire for financial gain, but rather by the hope of practicing medicine the best way they felt it should be done, free from the interference of a third party. For this freedom, they took upon themselves the difficulties of giving up families, resettling, learning a new language, wrestling with the licensing boards of the different states and, at times, fighting the prejudices of colleagues and patients. But they did not regret their actions.

What they *do* regret is observing the way the practice of medicine is heading in America, toward "third party" interference, just as in the countries they left behind.

The active members of the committee are all proud of their national heritage and the contributions which were given to the U. S., or to the world, by their respective nations. But they love their new, adopted country, and they wish to serve it by pointing out the mistakes made by others and by giving an honest and constructive criticism. They wish to avoid the same mistake here. Our doctors are good citizens and have their lives tied strongly now to the U. S., and they feel that what is good for the country is good for them, and what is bad for the country is bad for them, too.

The doctors of the committee have repeatedly stated that one can get excellent care in other countries, if the person needing care could have the services of professors or other leading medical authorities, and had unlimited financial means, but that the "average person" receives the best medical care in the U. S. Under the existing circumstances, if our committee members would have to be sick, they emphatically would prefer to be sick in the U. S.

Service Provides Professional Help in Fighting Drug Abuse

A new service for communities in the education, prevention and treatment of drug users has been formed in Phoenix, Ariz. The service, called Community Organization Institute, is designed specifically to provide professional assistance to cities, communities, medical societies and private groups in implementing a coordinated program based on the highly successful CODAC (Community Organization for Drug Abuse Control) which has been proclaimed as a model for the nation by experts.

COI is able to provide valuable assistance in every phase of a drug program including organization structure, community awareness, systems design, fund raising and governmental contracts. For further information, contact Community Organization Institute, 905 Financial Center, 3443 North Central Ave., Phoenix, Ariz. 85012.

PRESCRIBING INFORMATION
Antiminth (pyrantel pamoate) Oral Suspension

Actions. Antiminth (pyrantel pamoate) has demonstrated anthelmintic activity against *Enterobius vermicularis* (pinworm) and *Ascaris lumbricoides* (roundworm). The anthelmintic action is probably due to the neuromuscular blocking property of the drug.

Antiminth is partially absorbed after an oral dose. Plasma levels of unchanged drug are low. Peak levels (0.05-0.13μg/ml.) are reached in 1-3 hours. Quantities greater than 50% of administered drug are excreted in feces as the unchanged form, whereas only 7% or less of the dose is found in urine as the unchanged form of the drug and its metabolites.

Indications. For the treatment of ascariasis (roundworm infection) and enterobiasis (pinworm infection).

Warnings. *Usage in Pregnancy:* Reproduction studies have been performed in animals and there was no evidence of propensity for harm to the fetus. The relevance to the human is not known.

There is no experience in pregnant women who have received this drug.

Precautions. Minor transient elevations of SGOT have occurred in a small percentage of patients. Therefore, this drug should be used with caution in patients with pre-existing liver dysfunction.

Adverse Reactions. The most frequently encountered adverse reactions are related to the gastrointestinal system.

Gastrointestinal and hepatic reactions: anorexia, nausea, vomiting, gastralgia, abdominal cramps, diarrhea and tenesmus, transient elevation of SGOT.

CNS reactions: headache, dizziness, drowsiness, and insomnia. Skin reactions: rashes.

Dosage and Administration. *Children and Adults:* Antiminth Oral Suspension (50 mg. of pyrantel base/ml.) should be administered in a single dose of 11 mg. of pyrantel base per kg. of body weight (or 5 mg./lb.); maximum total dose 1 gram. This corresponds to a simplified dosage regimen of 1 cc. of Antiminth per 10 lb. of body weight. (One teaspoonful = 5 cc.)

Antiminth (pyrantel pamoate) Oral Suspension may be administered without regard to ingestion of food or time of day; and purging is not necessary prior to, during, or after therapy. It may be taken with milk or fruit juices. Because of limited data on repeated doses, no recommendations can be made.

How Supplied. Antiminth is available as a pleasant tasting caramel-flavored suspension which contains the equivalent of 50 mg. pyrantel base per ml., supplied in 60 cc. bottles.

ROERIG Pfizer
A division of Pfizer Pharmaceuticals
New York, New York 10017

Clean sweep

PINWORMS 0
ROUNDWORMS 0
STAINS 0
ARTHUR

with a single dose of Antiminth
(pyrantel pamoate) ORAL SUSPENSION

Highly effective against nworm and roundworm

Non-staining to teeth oral mucosa on ingestion, to ols, clothing, linen

Simple dosage with a gle-dose regimen: 1 cc. per lb. body weight (1 tsp./50 lb.; ximum dose, 4 tsp.)

Well-tolerated, based on clinical studies*

Pleasant-tasting, easy-to-take, caramel-flavored oral suspension

Economical, because one prescription can treat the entire family

ROERIG Pfizer
A division of Pfizer Pharmaceuticals
New York, New York 10017

ANTIMINTH®
(pyrantel pamoate)
equivalent to 50 mg. pyrantel/ml.
ORAL SUSPENSION

While Antiminth is highly effective against pinworms and roundworms, the illustration is not meant to imply 100% efficacy.

*Data on file at Roerig.

The Council Reports

Meeting of Dec. 9-10, 1972

James C. Cope, M.D., Columbia, Chairman, called the meeting to order. Those present were Drs. Cope; Walter T. Gunn, St. Louis; E. A. Stricker, St. James; John I. Matthews, Jefferson City; Charles R. Gulick, St. Louis; Gerald L. Miller, Kansas City; John N. Martin, St. Joseph; Lysle M. Bach, Hannibal; Max S. Franklin, St. Louis; Louis P. Hetlage, Troy; William D. Bradshaw, Clinton; R. Allen Chandler, Kansas City; Howard J. McAlhany, Springfield; Claude W. Cooper, Thayer; Eugene T. Hansbrough, Poplar Bluff; Hector W. Benoit, Jr., Kansas City; Stanley S. Peterson, Springfield; J. Loren Washburn, Versailles; Samuel B. Guze, St. Louis; George A. Thoma, St. Louis; William D. Mayer and William C. Allen, Columbia; Allen Klippel, St. Louis; Paul R. Young, Columbia; Melvin Kasten, Cape Girardeau; Arthur Rikli, John Maher, Helen Yeager, Columbia; Mrs. Keith D. Jones, Warrensburg; Mrs. Jackie Watson, St. Louis; Messrs. Lee Mortenson, Chicago, Ill.; John Noble, Kennett; Allen D. Smith, Kansas City; Hollister S. Smith, St. Louis; Gary L. Schnedler and Max Lilley, Springfield; Mark Halvorson, Jefferson City; Ray McIntyre, Tom P. Fox, Royal O. Cooper and C. C. Swarens, Staff.

Chairman Cope called the meeting to order and requested approval of the minutes of the Sept. 16-17, 1972 Council meeting. Dr. Hetlage indicated that due to several objections, he had withdrawn the statement regarding organized medicine which appeared in the Councilors' copy of the minutes and would discuss this further during his Councilor District report. On motion, duly seconded, the Council minutes as published in the Journal were accepted.

REPORT OF THE EXECUTIVE SECRETARY

Mr. McIntyre reported that Dr. Bach had represented the Missouri State Medical Association at the services for Dr. W. F. Francka, Hannibal, a Past-President of MSMA, who passed away recently. The Association sent flowers.

A note of thanks has been received from Mrs. Shattyn, widow of Dr. Martyn Shattyn, thanking the Association for the "In Memoriam Perpetuum." This tribute, signed by the MSMA President and the Executive Secretary, is sent to the families of deceased members.

Mr. McIntyre read a short note from Dr. George Ulett expressing his appreciation for the letter the Association sent when he resigned as Director of the Division of Mental Diseases. Dr. Harold Robb has been appointed as the new Director.

A letter was written to the AMA to find out why the AMA did not appear before the Kennedy Subcommittee on Health regarding HMO legislation on June 22, 1972. The reply pointed out that the AMA had reported to the committee on various other occasions.

The Councilor from District #6, Dr. Bradshaw, has been elected Vice-President of the State Board of Health.

A letter to John R. Smart, Ph.D., Central Methodist College, from Dr. Charles A. Worley, Chairman, MSMA Ad Hoc Committee on Health Manpower, regarding a "Community-Based Educational Manpower Project in Rural Mid-Missouri" was read. This letter indicated that the Committee had given unanimous approval in principle to the proposed project and further stated that the action of the committee was subject to official confirmation of the Council.

Motion was made to accept this Committee report. Motion was seconded and carried with one dissenting vote.

Mr. McIntyre stated that a news release was written regarding the stand the Council had taken on acupuncture at its September meeting. Prior to release, the Board of Healing Arts had taken action on this matter. Unfortunately, this was not known to the Association. Many times, press releases are misinterpreted, and the MSMA office has received many inquiries seeking physicians who will perform acupuncture.

In September the Missouri Ear, Nose and Throat Association, Inc., a statewide organization, was formed. The Association has asked the MSMA to recognize this organization on the Interspecialty Commission for otolaryngology. On motion of Dr. McAlhany, duly seconded, it was agreed that the Council accept the request of this group and that the organization becomes a member of the Interspecialty Commission.

Dr. Allen gave a short report on the meeting of the National Joint Practice Commission which he attended on November 9-10 in Atasca, Ill. at Dr. Worley's request.

Dr. Allen said he was pleased to represent the MSMA at the meeting. He stated that the impetus for establishment of the National Joint Practice Commission came from the National Commission for the Study of Nursing and Nursing Education for the purpose of promoting involvement of physicians and nurses in a cooperative effort to develop further the role of medicine and nursing to effect better health care. Both the president of the American Nurses Association and the president of the American Medical Association addressed the group. AMA President Hoffman pointed out that while the AMA supported the National Joint Practice Commission, he felt that the states were the laboratories for exploring and testing the expanded roles for nurses, as well as new mechanisms and roles of physicians and nurses working together in the private practice setting. A list of objectives were distributed to the participants. To date, 26 states have established Joint Practice Committees and others have Liaison Committees or some other form of formal liaison between physician and nurse organizations. Only two states have no structure for formal relationship between the two organizations. There were small group sessions for the major portion of the Conference with an opportunity for all attendees to participate.

Dr. Allen called attention to a booklet entitled, "The Physician's Assistant—Today and Tomorrow." He felt that it is well worth reading. The price of the book is $3.95 and can be obtained from the County Mailing

Service, Inc., Sawmill Road, Westhaven, Conn. 06516. On motion, duly seconded, the report given by Dr. Allen was accepted.

Mr. McIntyre stated that a letter had been received from the AMA regarding its National Leadership Conference to be held on Feb. 16-18, 1973. Discussion followed regarding which MSMA officers should attend this conference. On motion, duly seconded, it was agreed by the Council that the President-Elect, Chairman of the Council, Vice-Chairman of the Council and Executive Secretary should attend this National Leadership Conference.

REPORT OF LEGAL COUNSEL

Mr. Noble reported that the Health Care Foundation of Missouri case is set for trial on January 15, 1973. He indicated that he and Mr. Carson, Legal Counsel for the Health Care Foundation, are working on the details for the trial and will be in touch with those members of the Council whose presence they consider necessary at the trial.

Chairman Cope introduced and welcomed Dr. Melvin Kasten, Cape Girardeau, President of the State Board of Registration for the Healing Arts.

The Chairman added an item to the agenda regarding a Building Committee Report for Sunday.

REPORT OF THE TREASURER

Dr. Gulick presented the Treasurer's Report. He reviewed the figures shown in the Treasurer's Account, minus the accounts payable, which left a balance on hand of $40,214.89 as of Dec. 1, 1972. This does not include the investment account (at cost) of $125,733.91.

On motion of Dr. Gunn, duly seconded, the Treasurer's Report was approved.

REPORT OF THE BUDGET COMMITTEE

The Budget Committee met on Friday afternoon, December 8, prior to the Council meeting on Saturday. The Committee reviewed the material presented which showed Exhibit A—Actual Income through October 31, 1972; Expected Total Income for 1972; Income Budget for 1972 and Estimated Receipts for 1973. Exhibit B—Actual Expenditures through October 31; Estimated Expenditures for 1972; Budget for 1972 and Proposed Budget for 1973. Exhibit C—Actual Meeting and Committee Expenses through Oct. 31, 1972; Estimated Expenses for all of 1972 and Proposed Budget for 1973. A breakdown of anticipated income and expenses for the year 1972 was also included.

Dr. Gulick indicated that he felt the proposed budget for 1973 is practical and within anticipated income. He further stated that the Budget Committee recommends that for 1973, the interest from the Investment Fund be placed into the operating fund rather than being reinvested.

Dr. Gulick indicated that the building for the Missouri State Medical Association headquarters office has been paid for. However, this money did not come out of current income. The Budget Committee commended the AMA Delegates for the great job they have done and wanted them to know that their efforts are appreciated.

Dr. Gulick stated that at the April, 1972 Council Meeting, the Council recommended that the MSMA give $100 to each of the four SAMA (Student American Medical Association) organizations in the state in addition to the $100 donation to the National SAMA. This has been budgeted and will be done this next year. The following proposed budget was approved for 1973:

Salaries	$125,520.00
Furniture & Fixtures	500.00
Office Rent & Lights (Four months present office)	2,560.00
General Expense	3,900.00
Office Supplies	4,800.00
MSMF Assessment	39,340.00
Journal Expense	48,500.00
Postage	4,700.00
Equipment Rentals & Repairs	2,300.00
Telephone & Telegraph	8,000.00
Pension Expense	21,000.00
Legal & Professional	9,500.00
Payroll Taxes	5,502.00
Commission-Committee Meetings	38,100.00
Annual Session	18,500.00
Car Lease and Expense	2,300.00
Taxes—IRS	500.00
Travel Expenses	5,500.00
New Building Expense (Operating)	12,735.00
Total	$353,757.00

On motion of Dr. McAlhany, duly seconded, the report of the Budget Committee was accepted.

REPORT OF THE PRESIDENT

The Council's attention was called to the December 4 issue of the *AMA Newsletter* which states that a program entitled "What Price Health?" will be aired by NBC-TV on December 19 at 9:00 CST.

Governor-Elect Bond has been invited to be the banquet speaker at our 115th Annual Session of MSMA. Mr. Bond is not accepting engagements this far in advance and should receive a repeat invitation 60 days in advance of the speaking engagement. Dr. Sammons, a member of the AMA Board of Trustees, will be on the program of the Annual Session.

A recent opportunity to sit in on the giving of examinations by the Board of Registration for the Healing Arts was offered to Dr. Gunn. He felt that the examinations were well conducted.

The Texas Academy of Family Physicians has a program called "Doctor for a Day." This program, in essence, calls for a physician to be in the Capitol during the time when the General Assembly is in session. Dr. Koon, President of the Missouri Academy of Family Physicians, will try to start such a program for Missouri.

The MSMA has received a letter from a special committee of the University of Missouri-Columbia requesting the names of any physician or physicians recommended to fill the newly-created position of Provost for Health Affairs. Dr. Allen explained that the Board of Curators had approved creation of this new position and the Chancellor had appointed a committee that is in the process of describing the role of the provost and the type of individual needed to fill this position. Their charge is to present to the Chancellor and, subsequently, to the Board of Curators at least four candidates from whom one will be selected. Dr. Cope then appointed Dr. Bradshaw, Chairman; Drs. Chandler and Gulick as a committee to suggest a physician for the position of Provost. The Committee was asked to report on Sunday morning.

The AMA has requested appointments to the committee working with the Federal Food and Drug

Administration which is investigating drugs sold across-the-counter. Suggestions for these appointments were Drs. James O. Lottes, St. Louis; Richard P. Bowles, Liberty; and Albert D. Cross, Trenton.

Dr. Gunn reported that he had received a letter commending Mr. Tom Fox and thanking him for setting up the MECO program for next year.

COUNCILOR DISTRICT REPORTS

District #4—Dr. Hetlage reported that he had held his usual Councilor District Conference. However, it was not attended by a majority or quorum of the delegates, so there were no specific recommendations, but suggested reconsideration of some of those made previously.

Dr. Hetlage said that the Lincoln County Hospital staff, which represents part of the members of one of Dr. Hetlage's societies, had recommendations to make. One regarded automobile accidents. It is felt that the work being done by Dr. Klippel and his group perhaps does not include specifically those factors which apply to rural accidents. "We have recommendations to make that I feel are pertinent. Factors involved in the order of their frequency are highway engineering with specific regard to highway maintenance, highway markings, consistency of markings and consistency of lighting. Second, age of the drivers and their physical condition. We would suggest that the recommendation be made to the proper Commission to require compulsory examination, both physical and for competency, for those individuals over the age of 65. The third factor in importance is relative to drinking. We feel that permission to draw blood should be given and this should be included as a part of the signature on the drivers license." He further stated that they feel more time should be spent by the Highway Patrol in spot checking drunk drivers and less time on speeders. He further said that a great factor in his area is drivers who are fatigued and he indicated that they, too, might be spot checked by patrolmen. Dr. Hetlage asked that he be allowed to take these recommendations to the appropriate commission. No objections were raised.

The Council's attention was called to the entire situation relative to nursing home care. He stated that more attention should be given to appraisal and that he would talk with Dr. Bradshaw about this.

Dr. Hetlage reported that a significant meeting was held between the St. Charles County physicians and the local druggists. Matters of labeling and refill instructions were discussed. The druggists were not aware of the fact that the state has taken a stand on labeling of prescriptions. He pointed out that there is a serious problem on Sunday and holiday coverage in pharmacies. Dr. Hetlage said that he wanted to bring this to the Council's attention and recommended that this same meeting be conducted in other areas. Of 50 pharmacists invited to the meeting, 35 were in attendance.

Dr. Hetlage then brought up the subject of the statement which he voluntarily withdrew at the previous Council meeting regarding organized medicine and possible restructuring and changes. He said that it was a statement which was prepared carefully following the recommendation of the Councilor District Conference which consisted of a quorum of the delegates and officers of the Fourth District. He stated that he withdrew it and had each medical society approve it word for word. The remarks in that statement were not necessarily his, but the Councilor District's and they have approved it and asked that he present it and read it again into the minutes of this meeting. He indicated that there is no particular reference to any particular individual. Dr. Hetlage then read the following statement;

"It is not the District Councilor nor the Fourth District delegates, but a widespread opinion, that the structure of organized medicine needs changes which would put the profession into line with the social and economic, as well as governmental, pressures of the day. Physicians, particularly young physicians, at the grass roots level are speaking out on communications, participation, relevance and involvement within their profession. Many of these men feel that the structure of organized medicine fails to meet their needs for representation and involvement and either have become apathetic or have pressed their desire for change. There are those who feel that the hierarchy of medicine has ignored these cries and has resisted change until the degree of participation showed an alarming tendency to drop and that only now has the atmosphere become one receptive to change, change which should have been an ongoing process of an organization sensitive to the desires of those members who constitute the foundation of its being.

"As long as men are content to function within a set structure, there will be other men willing to place themselves in a position of jeopardy, to rouse those men into some kind of activity, be it positive or negative.

"Considerable thought has gone into recommendations to the delegates to the AMA from this district. No one has an answer. No one is willing to say that total revolution is an answer, but we do say that a careful examination of the structure is in order and that careful and relevant changes can and should be made.

"We feel that the AMA is not an entity unto itself. No. The AMA is state societies, composed of delegates, councilors, societies and grass roots members. We feel that change in the AMA should rightly begin at the county society level and extend through the state structure to ultimately be reflected on the posture and operation of the AMA.

"Of primary consideration, then, is the county medical society. Is it a relevant and effective political and educational unit? Would not the hospital staff, with its compulsory attendance and day to day liaison, be a more effective political unit?

"Care should be given to the position of delegate to the state convention. Is this job a meaningful one with opportunity for significant pertinent input, one to be sought after, or is it now a position to be filled by those who have nothing better to do than rubber stamp mostly meaningless resolutions? Is the quality of the delegate lower now than it would be if the job were a continuing one throughout the year, one to be sought after because of its responsibility and sensitivity?

"Are councilors seeking the job because they wish to have significant input and because they want to be representative of their districts? Should the job of councilor be a permanent position supported ad infinitum by the district who wants a president, or should his term be limited, so that fresh, new ideas would be forthcoming from younger men?

"Should the president always come from the Council or should the delegates have some voice in the selection from an open panel?

"Should the AMA Delegates be selected without limitation of tenure by a nominating committee with set instructions and elected without question by voice vote of a powerless house of delegates or should the AMA delegates be elected from an open slate proposed by an unrestricted nominating committee of responsible delegates?

"In other words, gentlemen, how is the grass roots member going to be properly represented to the AMA if he is not represented by a strong delegate organization, who actively seeks and pursues the job, who participates in district activities on an ongoing basis, and who have an active say in who will represent him as an officer of the state society and as a delegate to the AMA?

"The effect of a change to relevance on the part of the state conventions should have a noticeable effect upon the makeup of the AMA.

"Above that, we feel that younger but responsible men, both on a state and AMA level, should be used on commissions, committees and as alternate or subalternate representatives, recognizing the limitation of numbers within the delegate structure.

"We submit that the lines of communication from the top down should be further reinforced, that ongoing work at the AMA level be frequently reported by some appropriate means and that councilor district delegate meetings be kept informed as to those decisions which may be of relevance to the concerned physicians. In other words, the house of delegates has a reverse function, a reverse flow through the AMA delegates to the councilor district organization back to the local society.

"We submit that constructive thinking along these lines could lead to changes which would satisfy the thirst for representation among the members at the bottom."

Dr. Cope indicated that the above statement was sent to our AMA Delegates and Alternates prior to the Cincinnati meeting.

Lengthy discussion followed regarding the statement from the Fourth Councilor District. Communications is still the obvious problem and there was a suggestion made that the Councilors might ask for five minutes at hospital staff meetings to disseminate information. It was pointed out that where the information does not get back through publications, the Councilors should see that it does get to their areas. Should the Councilors have a budget for these purposes? It was indicated that one county invited hospital representation on its county society council. However, this effort failed as these hospital representatives did not attend the Council meetings.

Dr. Hetlage stated that he feels we need to stimulate the young physicians' desire to become involved in organized medicine. Many of them think the hierarchy of medicine doesn't really care about the relatively new physician. He stated that the key man program is certainly a valid one in hospitals. Many physicians feel that they are not represented in organized medicine. We need to make the job of state delegate an important one and not for just a couple of days a year.

Dr. Cope stated that he appreciated this report from the Fourth District, if only for its stimulating quality.

It was stated that not all physicians, young or old, want to become involved in organized medicine; many are just not interested and they have other interests.

It was brought out that many times young physicians who are just getting started in practice do not have the time to become involved in extra curricular activities. It takes several years to become interested. We need innovations, but perhaps the present system is not all bad.

Mr. Mortenson said that one AMA staff has four

What Iowa doctors need is a **Malpractice Liability Carrier** that won't fade when trouble comes.

speaking engagements at various Missouri component society meetings within the next month. This is one means of communication. He indicated that Illinois has implemented the key man system. They also have instituted a bulletin on the most recent state and AMA innovations to be placed in every hospital every two to three weeks. Mr. Mortenson indicated that everyone wants to be heard and wants to know that someone is listening to them specifically. He further stated that he could bring to the Council material on other state communications systems. It was pointed out that, indeed if all of these communications are to be expedited, it is going to cost money.

Dr. Gunn stated that if we implement this key man concept in the 200 hospitals, he would suggest that the green sheet be reproduced. It is the greatest means the AMA has to reach its people with facts, figures and timely items.

Dr. Hetlage stated that the report is more stimulating than constructive. He said that in the last session, his District submitted a resolution regarding the medical profession speaking out on public issues and also submitted the one regarding Council Chairmanship. He said that in the report itself there are several things that are constructive: first make the delegate's job a more important one—one to be sought after; secondly, limit the terms of Councilors. He stated that the four main words in the entire report are "communications, participation, relevance and involvement."

Dr. Cope suggested that Dr. Hetlage might break this report down into separate resolutions which could be referred to the proper commission or committee for study and recommendations.

District #10—Dr. Hansbrough indicated that we may have gotten away from the original purpose of the box and check mark on the front of the Journal to call members' attention to a very important item. On motion of Dr. Hansbrough, duly seconded, the Council requests the Publication Committee to review the purpose of the check mark on the front of the Journal.

Dr. Hansbrough reported that on November 19, his Council District meeting was held in Farmington with a very interesting program. Our MSMA President and the President of the Woman's Auxiliary were present. At the request of the physicians in the District, we tried to bring up socio-economic problems; physicians foundations, that is, special care foundations; HMOs; CHP; and a most stimulating and provocative talk by a young psychologist who stated that mental illness is too important to have a physician deal with it. Apparently, this is the way some clinical psychologists feel. His general concept on how to treat people was very interesting.

Dr. Hansbrough stated that he enjoyed being in Springfield during Dr. Hoffman's visit there.

He said that one thing they found out in his immediate area is how the new controlled drug act is affecting the community. He stated they are having a difficult time with falsified prescriptions.

At this point, Dr. Cope indicated that the wives were invited to an informal talk on transactional analysis in the Chairman's suite on Sunday morning at 9:30 A.M.

District #9—Dr. Cooper reported that they have postponed their Councilor District meeting until after the first of the year. He said he had had the pleasure of going on the Caribbean Cruise sponsored by the MSMA and asked to go on record as saying that the

MSMA MEMBERS!

Watch for Your Special Hotel Reservation Card!

For the convenience of members who plan to reserve rooms at the Chase-Park Plaza Hotel, the MSMA will mail a special, postage-paid reservation card with room rates and other pertinent information.

You should receive your reservation card this month. Please forward it to the hotel as soon as possible for best accommodations.

MISSOURI STATE MEDICAL ASSOCIATION

115th ANNUAL SESSION

March 29-April 1, 1973 Chase-Park Plaza Hotel, St. Louis

medical melange

Notes of interest from Here . . . . and There

Dr. Roy W. Pearse, who has practiced medicine in Nevada (Mo.) since 1937, was named "1972 Man of the Year" by the Nevada Rotary Club at a luncheon on January 4. Rotarian **Bill King**, head of the Man of the Year Selection Committee, stated that the Committee felt that Doctor Pearse is symbolic of the primary criteria of the award—"service above self." Doctor Pearse has become involved in almost every facet of Nevada's growth, with particular emphasis on the medical field. Three testimonials at the luncheon lauded his efforts in the community, highlighting his work on the Nevada Industrial Development Corporation and the Nevada R-5 School Board and as a physician. Doctor Pearse has served as Vice-President of the Missouri State Medical Association.

Dr. Wilfred E. Wooldridge of Springfield, Clinical Professor of Dermatology at the University of Missouri School of Medicine, has been invited to return for a second appearance on the Guest Lecture Series of New York University, Oncology Section. On April 12, he will speak on the subject, "An Evaluation of the Cryosurgical Treatment of Skin Cancer."

Dr. Donald H. Giesler, Osceola, was among 12 University of Missouri faculty members and 11 alumni to receive certificates for "distinguished" service to the University at the fifth annual Faculty-Alumni Awards Dinner in Columbia in 1972. Other alumni award recipients included James Shen, the Republic of China's ambassador to the U. S.; Mrs. Virginia Young, internationally-known lecturer; Norm Stewart, head basketball coach; and Missouri Secretary of State James Kirkpatrick. Don Faurot, who retired after 37 years at the University as both a football coach and athletic director, also was honored.

Dr. Wallace McDonald, a specialist in internal medicine and cardiology, is the fifth generation of doctors to practice in St. Joseph. His great-great-grandfather, **Dr. Silas McDonald**, graduated from Cincinnati Medical College in 1837 and was Buchanan County's first physician. He settled near Wallace in 1838, five years before the organization of the town of St. Joseph. His great-grandfather was **Dr. Daniel McDonald**, who graduated from Long Island College Hospital in 1865. His grandfather, **Dr. Lee McDonald**, graduated from the University of Pennsylvania Dental School in 1897. His father, **Dr. Wilbur McDonald**, graduated from the University of Pennsylvania School of Medicine in 1937 and has practiced in St. Joseph since 1938. Dr. Wallace McDonald received his M.D. degree at the University of Pennsylvania in 1966.

A picture in the Jan. 12, 1973 issue of the *St. Louis Globe-Democrat* showed **Dr. Richard A. Sutter** of St. Louis with his trophy, a stuffed Alaskan sheep bagged in an air hunting expedition 300 miles north of Fairbanks. The sheep will be permanently displayed in the animal museum beneath the Arch in St. Louis.

Dr. William H. Ames, St. Joseph, has been elected to membership as a fellow of the Council on Clinical Cardiology of the American Heart Association. The Council acts as an advisory body for the AHA in directing its scientific and educational programs. Dr. Ames is immediate past-president of the Missouri Heart Association and a former president of the St. Joseph heart division of the Association. He continues to serve as a director and executive committee member of both organizations.

Scandinavian Tour Scheduled for MSMA Members

This is Old Town, Stockholm's medieval wonderland of tiny courtyards and quaint antique shops. Visitors stroll its cobblestone streets and explore Stockholm's setting of islands as they discover the serene beauty of Sweden.

Leningrad, Russia's planned city of magnificent onion-domed cathedrals and great pastel-colored palaces, is one of several private excursions available exclusively for members of the MSMA Scandinavian Adventure.

A special 14-day Scandinavian Adventure tour to Stockholm, Helsinki and Copenhagen will be sponsored by the Missouri State Medical Association for its members and their wives. Departure date will be July 18, 1973.

This is the second tour to be sponsored by the MSMA and it will feature medical seminars for the physicians and visits to important medical facilities in the foreign countries visited.

The special Scandinavian Adventure price of $868 will include chartered round-trip jet transportation via World Airways, deluxe hotels, two meals daily (American breakfast in your hotel and gourmet dinners at a choice of the finest restaurants in each city), tips, transfers and other extras. The baggage allowance has been increased to 70 pounds, which is more than an adequate allowance for shopping abroad and golf clubs.

For four days in Stockholm, tour members will stay at the luxurious Sheraton-Stockholm Hotel located in the center of town. Points of special interest will include the magnificent Millesgarden sculptures, the stateliness of Drottningholm Palace and its charming Court Theatre, the famous Old Town and numerous Swedish shops featuring items from Orrefors glass and crystal, pottery and pewter to textiles, furs and jewels.

There is no regimentation on the tour. Members can plan their own sightseeing. From Stockholm, they may take a short flight to the Isle of Gotland to see the ancient walled city of Visby or visit the Uppsala-Sigtura Lake Country of exquisite churches and old, picturesque towns. Also, there will be the opportunity to take an optional side trip to Oslo, Norway's capital, and see the Viking Ship Museum, Olympic Ski Jump and Norse Outdoor Folk Museum.

The next stop will be in Helsinki, capital of Finland, called the white city of the North (four days). Guests will stay at the beautiful Hesperia Hotel. An optional overnight excursion to Leningrad will be available at a special tour price. Known as Russia's "Western window on the world," this planned city of great pastel-colored palaces and magnificent onion-domed cathedrals was built by the Czars.

Then, there will be four days in Copenhagen, the fun-loving Danes' cosmopolitan capital and Denmark's largest city. Guests can visit the illuminated dancing fountains of the famed Tivoli Gardens, the moated Renaissance castles and Vikingland, the oldest kingdom in Europe.

A special Scandinavian Adventure escort of five hosts will travel with the tour members and assist in arranging sightseeing, shopping, golfing, nightclubbing and other activities.

Send Reservations Now

All MSMA members are invited to join the tour and are urged to make reservations as soon as possible by forwarding the reservation coupon which appears on page 135 of this issue of Missouri Medicine. A full color brochure and other pertinent information will be forwarded by the MSMA upon receipt of the reservation.

Are combination drug products useful in treatment involving concomitant use of two or more drugs?

Opinion

Results of a questionnaire to 7,000 physicians:

62.9%
Believe combination drug products are useful.

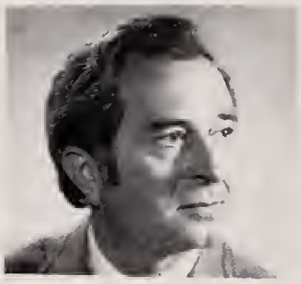
13.8%
Do not believe combination drug products are useful.

Are combination drug product useful in treatment involvin concomitant use of two or more drugs

Opinion & Dialogue

Doctor of Medicine

Louis Lasagna, M.D.
Professor and Chairman
Department of
Pharmacology & Toxicology
University of Rochester
School of Medicine
and Dentistry



Obviously, many drugs are given concomitantly. Whether it makes sense to combine medications in one preparation, be it capsule, tablet, or liquid, is a question that can be answered only by examining the advantages and disadvantages in the individual case.

Among the advantages is, first of all, convenience. The more medications that are taken concurrently and the more complicated the directions, the less likely the patient is to take medications accurately. From the standpoint of convenience and accuracy, and economy as well, you can make an important case for putting medications together in one preparation, as long as they are compatible.

By the same token, when you prescribe a properly tested and rational combination, you should have less worry about pharmaceutical or pharmacological compatibility — and about reasonable dosage ratios as well. Compatibility of the formulation should be demonstrated in the laboratory and clinic before the product is available for prescription—which is more than can usually be said for the physician's own spontaneous creations. And, the dosage ratios employed in rational precompounded combinations are designed to meet the needs of substantial numbers of "typical" patients.

There is no doubt that many "atypical" patients are to be found, and for them the prefabricated combination must be rejected. But that hardly argues for eliminating rational combinations from the market. Think, for example, of the problems that would arise if the components of widely accepted combinations, like the oral contraceptives and the diuretic-antihypertensives, always had to be prescribed, purchased and ingested separately.

One disadvantage that comes to mind is some doctors' unawareness of the ingredients a given combination contains. For example, a doctor might know that a patient is allergic to aspirin but forget that a certain analgesic mixture, which he knows only by its trade name, contains aspirin. His prescription, then, causes considerable discomfort, to say the least. This problem is a function of physician education, rather than of combination therapy as such. Improving doctors' knowledge about all medicaments they prescribe is a problem that deserves tackling on its own.

Another accusation leveled at combination drugs is that they encourage sloppiness of diagnosis and treatment. In many cases, however, a combination may prove to be the most effective choice. A good example of the usefulness of combinations appears in a recent article in the *Journal of Chronic Diseases* on the efficacy and side effects of an antihypertensive containing three ingredients, in which the track records of the combination drug and the individual ingredients were compared. Interestingly enough, whether the drugs were given individually or together, incidence and severity of side effects were the same. But blood pressure control was invariably better when the drugs were taken in one combination tablet than when they were taken separately (in "titratable" dosage) or in two or three different tablets.

Deciding which combinations constitute rational therapy obviously leads to a discussion of who is to determine which should be used and which should not. Realistically, I think combinations should be evaluated somewhat differently if they are old and established or new and untried.

In today's regulatory atmosphere, there is no possibility of a new combination being put on the market without a substantial amount of acceptable evidence in the form of controlled trials that show it to be safe and efficacious. On the other hand, I believe a different set of standards should apply to combination preparations that have been around for a long time. In other words, physician acceptance over a long period should be given some weight as evidence of the efficacy and safety of these drugs.

The FDA, however, does not seem to share this attitude. It often requires, for these older products, controlled trials that will monopolize the time of already overtired investigators and cost a great d
of money. I wish we co
agree on a "grandfat
clause" approach to pre
rations that have been in
for a number of years
that have an apparen
satisfactory track recor

For example, I th
some of the antibiotic c
binations that were ta

ake antihiotic mixtures,
source of much of the
icism generated against combinations generally. Obviously, no one should be exposed willy-nilly to the potential side effects of two or three antibiotics when only one is needed. At the same time there are cases where it is prudent to prescribe more than one. The clinician is the judge in these circumstances, as he should be.

There is no clear definition of the word rational. Most persons, I suppose, would find it synonymous with reasonable, but in many circumstances it may best he defined as the opinion of those in power at the moment.

Other factors govern combination therapy, not the least of which has been its broad use by practicing physicians anxious to achieve convenience in prescribing, to reduce medication error, and to save money for their patients. Combinations clearly have met the test on all three counts.

I have been impressed by studies showing that the rate of error climbs markedly with the number of medications to be taken, even with sophisticated patients. When medically justified, therefore, this factor alone supports the logic of combination therapy.

The cost argument for combinations appears to be irrefutable. In 1971, R. A. Gosselin studied the 71 combination products (excluding oral contraceptives) among the 200 most prescribed drugs. The study found that if all 71 products were discontinued, and if each ingredient in these combinations were prescribed separately, the price of medicines to patients would jump by $443.2 million on a national basis! At a time when the cost of medical care is under so much fire, it would be nonsensical to boost costs without clearly irrefutable medical reasons.

The part played by government on this question, of course, is fundamental. The FDA should play a role in determining which combinations are reasonable. That role, as defined by law and regulation, is to ensure that any medication on the market is safe and effective in line with its label claims. Certainly combinations are entitled to as much consideration as single entities—neither more nor less. So long as the addition of one drug to another does not make either less safe, or less effective, so long as they are compatible in a formulation, we have a reasonable product. It makes no sense to recommend the use of two products for certain conditions and to deny their being combined in a single form. An unhappy side effect of the problem concerns the efficacy panel discussions of many products submitted for review. The term "effective, but" has been freely interpreted to mean "ineffective" in toto, regardless of the merit of the individual drugs. This interpretation has placed numerous useful combination products in needless jeopardy.

In reading the actual reports of the review panels, it seems clear that some of the ratings were based less on scientific research and clinical observation than on the "informed" opinions of the panelists. These "informed" opinions were accepted at face value, while the "informed" opinions of others who had used the products were rejected. All of this put combination products into a sort of scientific never-never land.

It should be kept in mind by all, government as well as others involved in our health care system, that advances in therapy are seldom made in leaps and bounds but rather by small painstaking steps—and that some of these steps have resulted from research in combination drugs as well as with single entities. Given the near-infinite biologic variation in patient response, this is hardly surprising to clinicians. It should not be to regulatory agencies either.

In the end, the practicing physician is in the best position to decide if a particular combination makes sense. Such a decision should not be made exclusively by those whose responsibility for continuing clinical care is limited. Clinicians are the best judges of efficacy because the ultimate proof of any product's effectiveness is acceptance by physicians who have observed its actions in patients over time. The corollary statement may be made about over-the-counter medicines, which would not long survive if they failed to afford the relief the user anticipates. That the antihistamine in a "cold" remedy may not *always* be necessary is no reason to proscribe the combination generally.

Opinion & Dialogue

What is your opinion, doctor?
We would welcome your comments.

MINOCIN® made the difference in just eight days.*

Clinical Data:
Patient: 47-year-old male.
Diagnosis: Severe pyoderma, left hand.
Culture: *Staphylococcus aureus, coagulase* positive and sensitive to MINOCIN.
Temperature: 102° F
Therapy: MINOCIN Minocycline HCl Capsules, 100 mg: 200 mg *stat*, 100 mg every 12 hours. Medication began 9/7/71. By fourth day, temperature was normal and pustular lesions considerably improved. Last dose taken 9/14/71.
Concomitant therapy: None.†

Semisynthetic
MINOCIN®
MINOCYCLINE HCl
Capsules, 100 mg: 2 *stat*, 1 q 12 h.

Indications: For the treatment of susceptible infections; e.g., *E. coli, D. pneumoniae*. For full list of approved indications consult labeling.
Contraindications: Hypersensitivity to any tetracycline.
Warnings: The use of tetracyclines during tooth development (last half of pregnancy, infancy and childhood to the age of 8 years) may cause permanent discoloration of the teeth (yellow-gray-brown). This is more common during long-term use but has been observed following repeated short-term courses. Enamel hypoplasia has also been reported. Tetracyclines, therefore, should not be used in this age group unless other drugs are not likely to be effective or are contraindicated. In renal impairment, usual doses may lead to excessive accumulation and liver toxicity. Under such conditions, use lower total doses, and, in prolonged therapy, determine serum levels. Photosensitivity manifested by an exaggerated sunburn reaction has also been observed in some individuals taking tetracyclines. Advise patients apt to be exposed to direct sunlight or ultraviolet light that such reaction can occur, and discontinue treatment at first evidence of skin erythema. Studies to date indicate that photosensitivity does not occur with MINOCIN Minocycline HCl. In patients with significantly impaired renal function, the antianabolic action of tetracycline may cause an increase in BUN, leading to azotemia, hyperphosphatemia, and acidosis. CNS side effects (lightheadedness, dizziness, vertigo) have been reported, may disappear during therapy, and always disappear rapidly when drug is discontinued. Caution patients who experience these symptoms about driving vehicles or using hazardous machinery while taking this drug. *Pregnancy:* In animal studies, tetracyclines cross the placenta, are found in fetal tissues, and can have toxic effects on the developing fetus (often related to retardation of skeletal development). Embryotoxicity has been noted in animals treated early in pregnancy. Safety of use during human pregnancy has not been established. *Newborns, infants and children:* All tetracyclines form a stable calcium complex in any bone-forming tissue. Prematures, given oral doses of 25 mg./kg. every 6 hours, demonstrated a decrease in fibula growth rate, reversible when drug was discontinued. Tetracyclines are present in the milk of lactating women who are taking a drug of this class.

Precautions: Use may result in overgrowth of nonsusceptible organisms, including fungi. If superinfection occurs, institute appropriate therapy. In venereal diseases when coexistent syphilis is suspected, darkfield examination should be done before treatment is started and blood serology repeated monthly for at least four months. Because tetracyclines have been shown to depress plasma prothrombin activity, patients on anticoagulant therapy may require downward adjustment of such dosage. Test for organ system dysfunction (*e.g.*, renal, hepatic and hemopoietic) in long-term use. Treat all Group A beta hemolytic streptococcal infections for at least 10 days. Avoid giving tetracycline in conjunction with penicillin.

Adverse Reaction: GI: (with both oral and parenteral use): anorexia, nausea, vomiting, diarrhea, glossitis, dysphagia, enterocolitis, inflammatory lesions (with monilial overgrowth) in anogenital region. *Skin:* maculopapular and erythematous rashes. Exfoliative dermatitis (uncommon). Photosensitivity is discussed above ("Warnings"). *Renal toxicity:* rise in BUN, dose-related (see "Warnings"). *Hypersensitivity reactions:* urticaria, angioneurotic edema, anaphylaxis, anaphylactoid purpura, pericarditis, exacerbation of systemic lupus erythematosus. In young infants, bulging fontanels have been reported following full therapeutic dosage, disappearing rapidly when drug was discontinued. *Blood:* hemolytic anemia, thrombocytopenia, neutropenia, eosinophilia. *CNS:* (see "Warnings.") When given in high doses, tetracyclines may produce brown-black microscopic discoloration of thyroid glands; no abnormalities of thyroid function studies are known to occur.

NOTE: Concomitant therapy: Antacids containing aluminum, calcium, or magnesium impair absorption; do not give to patients taking oral minocycline. Studies to date indicate that absorption of MINOCIN is not notably influenced by foods and dairy products.

***Indicated in infections due to susceptible organisms. Culture and sensitivity testing recommended. Tetracylines are not the drugs of choice in the treatment of any staphylococcal infection.**

†Case Report, Clinical Investigation Department, Lederle Laboratories.

Lederle LEDERLE LABORATORIES, A Division of American Cyanamid Company, Pearl River, New York 10965 12-20 436-2

"For generations my family has insisted on Donnagel®-PG," says active young matron Mrs. T. Farnsworth Lipp (of the Upper Lipps), shown here with her charming son. "All the benefits of paregoric—without the unpleasant taste, don't you know? And Junior thinks Donnagel-PG tastes so much like bananas that I never worry about a slip between spoon and Lipp."

A Matter of Taste

With or without a silver spoon, a most tasteful solution in treating acute, non-specific rrheas: all the benefits of paregoric, without the unpleasant taste. Donnagel®-PG treats ompanying cramping, tenesmus, and nausea as well as the diarrhea itself. Instead of leasant-tasting paregoric, it contains the therapeutic equivalent, powdered opium, promote the production of formed stools and lessen the urge. And it provides the nulcent-detoxicant effects of kaolin and pectin, plus the antispasmodic benefits of ladonna alkaloids. And a good banana flavor to baby any taste.

Donnagel-PG
6 FL.OZ.
A·H·ROBINS

Donnagel®-PG

Donnagel with paregoric equivalent

Ⓥ Available on oral prescription or without prescription under limited circumstances as modified by applicable state law.

Each 30 cc. contains: Kaolin, 6.0 g.; Pectin, 142.8 mg.; Hyoscyamine sulfate, 0.1037 mg.; opine sulfate, 0.0194 mg.; Hyoscine hydrobromide, 0.0065 mg.; Powdered opium, USP, 24.0 mg. uivalent to paregoric 6 ml.) (Warning: may be habit forming); Sodium benzoate (preservative), mg.; Alcohol, 5%. A.H. Robins Company, Richmond, Virginia 23220

OBITUSSIN®
INE

The coughing season is here again. Time to rely on the four Robitussins and Cough Calmers to help clear the lower respiratory tract. All contain glyceryl guaiacolate, the efficient expectorant that works systemically to help increase the output of lower respiratory tract fluid. The enhanced flow of less viscid secretions soothes the tracheobronchial mucosa, promotes ciliary action, and makes thick, inspissated mucus less viscid and easier to raise. Available on your prescription or recommendation.

For coughs of colds and "flu"

ROBITUSSIN®

Each 5 cc. contains:

Glyceryl guaiacolate	100 mg.
Alcohol, 3.5%	

For unproductive allergic coughs

ROBITUSSIN A-C® Ⓒ

Each 5 cc. contains:

Glyceryl guaiacolate	100 mg.
Pheniramine maleate	7.5 mg.
Codeine phosphate	10.0 mg.
(warning: may be habit forming)	
Alcohol, 3.5%	

Non-narcotic for 6-8 hr. cough control

ROBITUSSIN-DM®

Each 5 cc. contains:

Glyceryl guaiacolate	100 mg.
Dextromethorphan hydrobromide	15 mg.
Alcohol, 1.4%	

Robitussin-DM in solid form for "coughs on the go"

COUGH CALMERS®

Each Cough Calmer contains:

Glyceryl guaiacolate	50 mg.
Dextromethorphan hydrobromide	7.5 mg.

Relieves cough, clears sinuses and nasal passages—keeps them "drip-dry" but not bone dry

ROBITUSSIN-PE®

A-H-ROBINS

A. H. Robins Company, Richmond, Virginia 23220

Pinworm therapy is often a family affair

Contraindications: History of hypersensitivity to thiabendazole. **Warnings:** If hypersensitivity reactions occur, drug should be discontinued immediately and not resumed. Rarely, erythema multiforme has been associated with thiabendazole therapy; in severe cases (Stevens-Johnson syndrome), fatalities have occurred. Because CNS side effects may occur quite frequently, activities requiring mental alertness should be avoided. Safe use in pregnancy or lactation has not been established. **Precautions:** Ideally, supportive therapy is indicated for anemic, dehydrated, or malnourished patients prior to initiation of anthelmintic therapy. In presence of hepatic or renal dysfunction, patients should be carefully monitored. **Adverse Reactions:** Most frequently encountered are anorexi nausea, vomiting, and dizziness. Less frequently, diarrhea, epigastric distress, pruritus, weariness, drowsiness, giddines and headache have occurred. Rarely, tinnitus, hyperirritabilit numbness, abnormal sensation in eyes, blurring of vision, xanthopsia; hypotension, collapse; enuresis; transient rise in cephalin flocculation and SGOT; perianal rash, cholestasis an parenchymal liver damage; hyperglycemia; transient leukope malodor of the urine, crystalluria, hematuria; appearance of l Ascaris in the mouth and nose. Hypersensitivity reactions

INDICATION | DOSAGE SCHEDULE

MINTEZOL® (Thiabendazole, MSD) has demonstrated effectiveness against a broad spectrum of nematode infections. Dosages are weight related. For your convenience, the information in the weight-dose chart below is included in the full prescribing information and in the 1973 edition of PDR.
The recommended maximum daily dose of MINTEZOL is 3 g (6 tablets).
MINTEZOL should be given after meals if possible. Dietary restriction, complementary medications, and cleansing enemas are not needed.
The usual dosage schedule for all conditions is two doses per day. The size of the dose is determined by the patient's weight.

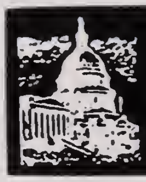
Weight-dose chart:

WEIGHT (lb)	EACH DOSE (g)	TABLETS
25	0.25	½
50	0.5	1
75	0.75	1½
100	1.0	2
125	1.25	2½
150 & over	1.5	3

The regimen for each indication follows:

INDICATION	REGIMEN	COMMENTS
Pinworm disease	Two doses per day for 1 day. Repeat in 7 days. This regimen is designed to reduce the risk of reinfection.	If this is not practical, give 2 doses per day for 2 successive days.
Threadworm,* large roundworm,* hookworm,* and whipworm* disease	Two doses per day for 2 successive days.	A single dose of 20 mg/lb or 50 mg/kg may be employed as an alternative schedule, but a higher incidence of side effects should be expected.
Creeping eruption	Two doses per day for 2 successive days.	If active lesions are still present 2 days after completion of therapy, a second course is recommended.
Symptoms of trichinosis* during the invasive phase of the disease	Two doses per day for 2 to 4 successive days according to the response of the patient.	The optimal dosage for the treatment of trichinosis has not been established.

*Clinical experience with thiabendazole for treatment of each of these conditions in children weighing less than 30 lb has been limited.



WASHINGTON

New faces will be leading the nation's major governmental health programs in President Nixon's second term in office.

At the helm of the Department of Health, Education and Welfare will be a new kind of secretary, a man with a reputation as a budget slasher with a zeal for protecting the taxpayers' dollar.

Caspar Weinberger will be the first HEW secretary schooled in the money world of fiscal prudence. Nicknamed "Cap the Knife," the appointment of Weinberger to run the government's social welfare, health and educational programs perhaps marks the President's most daring cabinet decision.

Selection of the 55-year-old California lawyer seems to be proof of the President's intention to reverse the tide of heavier federal welfare spending, to channel more money and responsibilities to states and localities and to steer away from the European welfare state concept.

Weinberger will be moving over to HEW from the post of director of the White House Office of Budget and Management, a cabinet post but one in which Weinberger was able to function in the comparative anonymity he has preferred to date. At HEW, he will be thrust into the limelight and in short time will become one of the best-known public figures in the nation.

Despite its reputation as a wrecker of reputations, the HEW Department secretaryship has served most of its occupants well. Outgoing Secretary Elliot Richardson was elevated to the more powerful and prestigious post of defense secretary. Abraham Ribicoff, who despaired of presiding over the "can of worms" at HEW, found his tenure there no handicap in his race for the Senate.

Ribicoff will be one of the senators present at the Senate Finance Committee confirmation hearing in January on Weinberger's nomination. The confrontation between Ribicoff and Weinberger promises to be an interesting exchange as Weinberger outlines his views on his new position and Ribicoff contributes his advice.

Few fireworks are expected at the confirmation hearing. No committee on Capitol Hill is more conscious of the waste and duplication at HEW than Senate Finance which has a membership considerably more conservative than the Senate as a whole.

Weinberger undoubtedly will give a good picture of his general views and philosophies during his appearance. If he follows tradition, a more detailed explication will be made at a news conference after he is confirmed and sworn in as HEW Secretary.

Weinberger is no stranger to the operations of HEW. At the Budget Office, he became well acquainted with the finances of HEW and, indeed, in tandem with the White House, exerted extraordinary fiscal powers over federal health programs.

Weinberger's appointment may end a chafing dichotomy between the White House staff and the White House OMB on the one hand and HEW on the other. As a loyal Administration servant, Richardson was willing to put up with the situation while it lasted, but it is doubtful he would have remained compliant much longer.

There's little question that Weinberger is going to propose HEW cuts that will enrage some congressmen. On the whole, however, the expectation here is that he won't be easily categorized except perhaps as a pragmatist.

He has noted for example, that more than 71% of federal expenditures are for things over which the Administration has no control—such items as interest on the national debt, Medicare and veterans compensation.

* * *

John G. Veneman, the number two man at HEW, also has announced his resignation, presumably with an eye to running for lieutenant governor of California.

Veneman was a frequent spokesman for HEW before the Congress before he became undersecretary of Health, Education and Welfare in 1969 at the request of then-HEW Secretary Robert H. Finch.

Frank C. Carlucci, the former director of the

Office of Economic Opportunity who now is deputy budget director, is in line to replace Veneman. Carlucci was number two man in the Office of Management and Budget to Caspar Weinberger.

Carlucci's place in the Office of Management and Budget will be taken by Fred Malek, the Nixon Administration troubleshooter who now heads recruiting efforts in the reshuffle taking place before the President's second term.

* * *

Also departing from the command line-up at HEW are Assistant Secretary for Health and Scientific Affairs, Merlin DuVal, M.D., and Vernon Wilson, M.D., chief of Health Services and Mental Health Administration, the largest operating branch of HEW.

Doctor DuVal, whose resignation comes 16 months after his appointment, returns to the University of Arizona where he will be vice-president for medical affairs. Doctor Wilson returns to the University of Missouri Medical School after guiding HSMHA since May, 1970.

Doctor DuVal believes that the administration of health programs has been tightened and control over the various health agencies strengthened during his tenure. He gives HEW Secretary Elliot Richardson credit for moving in this direction, though he helped institute much of the change. DuVal also significantly broadened HEW's health liaison with other federal departments.

Doctor Wilson carried out a sweeping reorganization of HSMHA, focusing management in his office and among his deputies. He was given high marks for bringing order out of an amorphous spread of agencies.

In neither case were the resignations of DuVal and Wilson the result of any pressure from above. The Administration wanted both physicians to stay on. The departures of DuVal and Wilson give new HEW Secretary Caspar Weinberger two important health slots to fill.

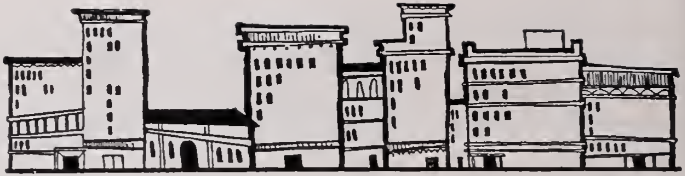
From the Medical Schools



WASHINGTON UNIVERSITY

David M. Kipnis, M.D., has been named Washington University School of Medicine's Busch Professor and head of the Department of Medicine.

Dr. Kipnis

Doctor Kipnis, who has been a professor of medicine since 1965, succeeds the late *Carl V. Moore,* M.D., who died on Aug. 13, 1972. Doctor Moore had held the position since 1955.

Doctor Kipnis joined the Washington University medical faculty in 1955 to work with Nobel laureate *Carl F. Cori,* M.D., then professor and head of the Department of Biological Chemistry. He has served as director of Washington University's Clinical Research Center since 1960, and in August, 1972, was named director of the new Lipids Research Center.

Recognized as an authority on endocrinology and diabetes, Doctor Kipnis won the American Diabetes Association's Lilly Award and the Endocrine Society's Ernst Oppenheimer Award in 1967. He was the first to win the two prizes in the same year. The Lilly Award recognized his contribution to the understanding of intracellular transport and metabolism of glucose, insulin and growth hormone. The Oppenheimer Award honored his "meritorious achievement in clinical endocrinology."

Doctor Kipnis received his M.D. degree, summa cum laude, from the University of Maryland School of Medicine in 1951. He trained at Johns Hopkins University, Duke University and University of Maryland hospitals before going to Washington University on an American College of Physicians Research Scholarship. He was appointed a John and Mary Markle Scholar in Medical Science from 1956 to 1961.

E. James Anthony, M.D., Blanche F. Ittleson Professor and head of the William Greenleaf Eliot Division of Child Psychiatry at the School of Medicine, was one of five medical researchers who recently participated in a series of news media sessions sponsored by the National Institute of Mental Health (NIMH), in Washington, D. C.

Doctor Anthony discussed results from NIMH-supported studies of children of psychotic parents conducted at the Medical School's child development research center. The seven-year study has involved 642 children up to age 17 in 220 families where one or both of the parents is subject to either schizophrenia or manic-depressive psychosis.

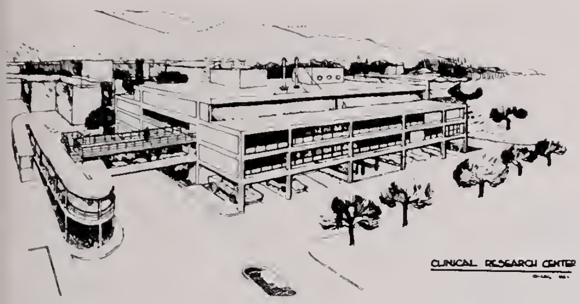
Dr. Arpad Csapo, professor of obstetrics and gynecology, has been awarded the International Health Foundation Award for 1972. He was notified by Dr. P. A. van Keep, director-general of the Geneva-based International Health Foundation, that his article, "The Prospects of Prostaglandins in Postconceptional Therapy," had won the prize which carries with it a cash award of 5,000 Swiss francs. Doctor Csapo is an internationally-recognized authority on hormonal control of the human uterus. Before his appointment at Washington University in 1963, he was head of the Laboratory of Physiology of Reproduction at Rockefeller University in New York.

ST. LOUIS UNIVERSITY

Dedication ceremonies marking the completion of the $4.5 million Anemia and Malnutrition Research Center of Chiang Mai and St. Louis Universities in Chiang Mai, Thailand highlighted an international symposium on protein-calorie malnutrition held there on January 8-11, according to *Dr. Robert H. Felix,* dean, St. Louis University School of Medicine. His Majesty, *The King of Thailand,* presided.

Dr. Robert E. Olson, Doisy professor and chairman of the Department of Biochemistry at the St. Louis University School of Medicine, is director of the Center and was present for the dedication. He was among the prominent speakers who delivered papers at the meeting.

Before departing for Thailand, Doctor Olson said, "It is probably true that this is the most important medical meeting to be held in Thailand in its entire history. There will be more distinguished scientists gathered to attend the meeting than have previously assembled anywhere in that country for medical discussion, and we think this is something of a landmark



Architect's concept of the Anemia and Malnutrition Research Center of Chiang Mai University and St. Louis University.

for Chiang Mai as well as for St. Louis University."

The new four-floor, air-conditioned Center contains service research facilities, major laboratories, patient-bed areas, animal quarters, administrative offices and a library-conference room. The laboratories are equipped with all the necessary instruments to carry out modern research including rooms for electron microscopes and specialized equipment.

The Center is aided by grants from the National Institutes of Health, the Rockefeller Foundation and the Government of Thailand.

Proceedings of the three-day symposium will be published and will be made available to the scientific community as a status report on protein/calorie malnutrition in Thailand.

Dr. Thomas F. Frawley, professor and chairman, Department of Internal Medicine, was selected by the American College of Physicians to serve with a team of United States Professors of Medicine on the faculty of medicine of the Universidad Central de Venezuela, Caracas, Venezuela and the Venezuelan Society of Internal Medicine on January 22-26. Other members of the team were selected from the University of Pennsylvania School of Medicine, the Dartmouth Medical School and the Bowman Gray School of Medicine. The professors gave lectures and demonstrations at the School of Medicine and provided consultative assistance with respect to modernizing the school's medical education methods so that it will be able to meet the growing need for physicians in Venezuela.

Dr. D. Elliott O'Reilly was named president-elect of the American Academy for Cerebral Palsy at the annual meeting in Washington. He was treasurer of the group from 1966 until present and has held offices as chairman of four committees in the Academy from 1962 to 1966.

Dr. William E. Allen, associate clinical professor of radiology, was elected to active membership in the American Society of Therapeutic Radiologists at its recent meeting in Phoenix, Ariz. Doctor Allen is radiotherapist for the St. Louis University Medical Center.

The St. Louis University School of Medicine has a *new telephone number*. It is 664-9800, replacing 865-2288. All stations remain the same. This number also applies to the St. Louis University Medical Center Administration, School of Nursing and Allied Health Professions, Graduate Department of Orthodontics, Institute of Molecular Virology and the Public Relations and Development Departments. The telephone numbers for the St. Louis University Hospitals (Firmin Desloge and David P. Wohl Memorial Mental Health Institute), Cardinal Glennon Memorial Hospital for Children, the Doctor's Office Building and the Catholic Hospital Association remain the same.

UNIVERSITY OF MISSOURI-COLUMBIA

Dr. Eleanor Shaheen has been appointed professor and associate chairman of pediatrics at the University of Missouri-Columbia School of Medicine.

Doctor Shaheen, who has held similar positions at Hahnemann Medical College in Philadelphia, is particularly interested in child growth and development, with special emphasis on emotional problems. She also has been patient care coordinator for children at Hahnemann Medical College and Hospital, has had responsibility for teaching programs in the pediatric division and has been involved in the development of intensive ambulatory service programs and out-reach community programs.

Dr. Shaheen

She received her M.D. degree from the University of Pennsylvania in 1950. Her residency training was at Children's Hospital in Philadelphia where she later held a postdoctoral fellowship in psychological pediatrics.

She has served on the staff of the Graduate School of Public Health at the University of Pittsburgh; as director of medical education (pediatrics) for St. Michael's Hospital in Newark, N.J.; as senior public health physician for the New Jersey State Department of Health; and an association physician in the division of gastroenterology at Children's Hospital in Philadelphia. She joined the Hahnemann Medical College faculty in 1964 and was named a full professor and associate chairman of pediatrics in 1971.

Unusual Renal Arteries in a Potential Kidney Donor

Case Report

Variations in the renal arteries are more commonly found in the presence of anomalous renal development. Some 30% of persons with normal kidneys have more than a single renal artery per side,[1] but the chance for multiple renal arteries is considerably greater in the presence of malrotations, fusions and ectopias, such as in horseshoe kidneys.[2] A recent case of anomalous renal arteries is described as encountered in a potential kidney donor.

Case Report

A healthy 48-year-old white man entered St. Luke's Hospital on Jan. 25, 1972 following preliminary out-patient investigation for the possibility of serving as a renal donor for his anephric, post-glomerulonephritic, middle-aged brother. Accumulated data included normal EKG, chest X-Ray, complete blood cell count, SMA-12 analysis, creative clearance (130 cc/min) and tissue typing showing an "A" match.

The patient underwent percutaneous transfemoral flush aortography without incident, which demonstrated multiple bilateral renal arteries. The left kidney (Figs. 1 & 2) was served by a left main renal artery which divided early, plus an accessory branch to the lower pole arising from a common aortic trunk vessel at the L_1 vertebral level. This same trunk artery, extending toward the left, gave off a right branch to the central portion of the right kidney, while passing in front of the aorta (Figs. 1 & 2). The upper pole of the right kidney received blood from the main right renal artery. Another accessory branch (Fig. 2) arising opposite the third lumbar vertebra fed the lower pole of the right kidney. Because of the common trunk artery off the aorta serving both kidneys and the multiple arteries to the potential donor kidney (the left one), the patient was turned down as a kidney transplant donor.

Reported Variations in Renal Artery Anatomy

Multiple renal arteries have been known since Eustachius first described a case in 1552.[3] Em-

Some 30% of people with normal kidneys have more than a single renal artery supplying each kidney. In this day of advancing use of renal transplantation, the surgeon must know the status of the renal arteries before attempting transplantation. Multiple renal arteries preclude transplantation because of small branches which are technically difficult to anastamose successfully. In this case report, a potential renal artery donor was rejected because of an unusual anomalous origin of the main renal arteries from a common aortic branch in the presence of apparently normal kidney architecture. Doctor Davidson is a Radiologist at St. Luke's Hospital of Kansas City.

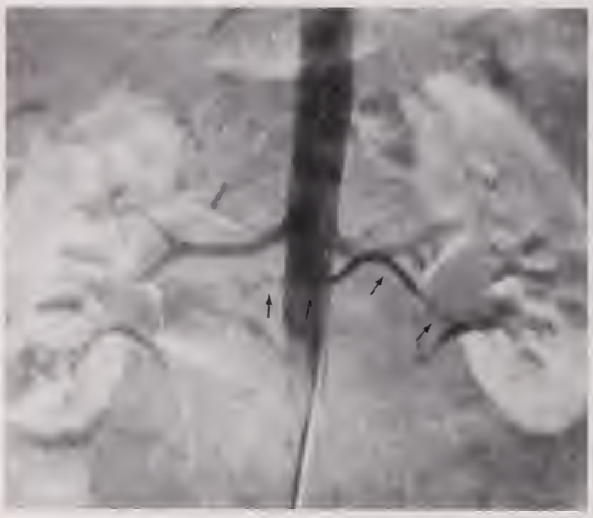

Fig. 1 Retrograde transfemoral aortogram, early injection phase (subtraction print). Aortic trunk vessel with accessory left lower polar and right central renal branches (*arrows*).

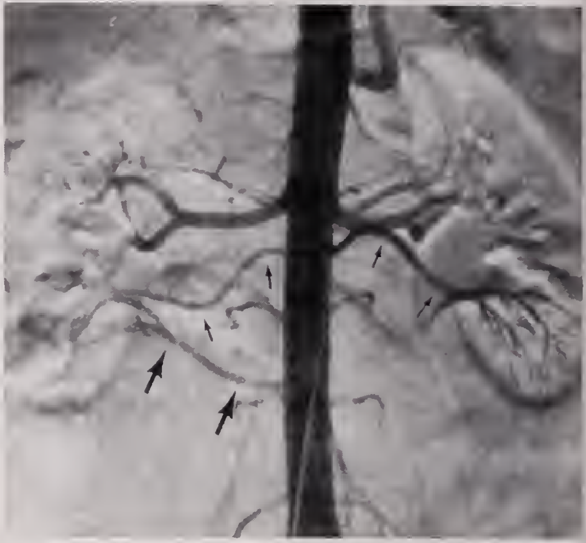

Fig. 2. Aortogram, later arterial phase (subtraction print). Aortic trunk vessel with accessory left lower polar and right central renal branches (*small arrows*). Accessory right lower polar branch arises from aorta (*large arrows*).

bryologically, the primitive urogenital structures are supplied by an extensive pattern of small aortic branches, the rete arteriosum urogenitale.[1, 4] Lack of tissue differentiation and relative development from the embryological state, as seen in the renal malrotations, fusions and ectopias, is often accompanied by persistance of variable numbers and patterns of these embryonic branches from the aorta or its main abdominal tributaries.[1, 4-6] Because of the relatively common presence of multiple or anomalous renal arteries, it becomes imperative when renal transplantation is considered that the potential donor kidney (usually the left because of adequate vessel length) be evaluated by arteriography. Accessory vessels, located at either pole of the kidney and supplying less than the major amount of renal parenchyma, constitute a reason for rejection of the kidney as a donor source.

Extra-aortic supernumerary renal artery branches are rare but have been reported arising from a number of different branches, including coeliac, right hepatic, inferior phrenic, right colic, inferior mesenteric, second and third lumbar, gonadal, common and external iliac, hypogastric and middle sacral arteries.[1, 5, 7, 8] Also, these supernumerary branches are usually seen with renal anomalies.

Bilateral accessory renal arteries from a common aortic or renal trunk artery are rarely reported with normal kidneys.[9-11] The current case seems even more unusual since, in the presence of apparently normal kidneys, an aortic trunk artery supplied a left lower polar branch and a right central branch, while the right lower pole was supplied by a third accessory branch from the aorta.

Bypass Vein Grafts to Distal Tibial or Dorsalis Pedis Arteries

Case Reports

Amputations can be prevented and many patients rehabilitated by long bypass vein grafts anastomosed to arteries in the lower leg or foot. Although the long-term results are still in doubt, the early success is encouraging. The technique reported proposes the following:

1. Detailed arteriograms prior to any amputation. Late phase films frequently reveal distal vessels satisfactory for anastomosis.
2. All grafts originate on the common femoral artery, with rare exceptions.
3. The distal anastomosis is end-to-side to the peroneal, posterior tibial, anterior tibial or dorsalis pedis arteries at any level below the popliteal trifurcation. The magnifying loupe has been useful.

Indications and Preoperative Evaluation

All 24 patients had advanced ischemia of the foot manifested by pain at rest, gangrene of the toes or nonhealing ischemic ulcers (Table 1). Sepsis involving the heads of metatarsal bones was present in four cases. In this series, the operation was not performed for intermittent claudication, and we have not yet encountered cases of trauma or embolism in which it was necessary or feasible. The only contraindications have been recent myocardial infarction, renal failure or gangrene proximal to the foot.

These patients were advanced in years; all had arteriosclerosis elsewhere and two thirds of them had diabetes (Table 2). The patients ranged in age from 60 to 81 years, and the average age was 72. Arteriosclerotic heart disease was evident in all but three, and many required maintenance digitalis. Three had previous cerebral vascular accidents.

TABLE 1

INDICATIONS

Ischemic pain at rest	24
Gangrene of toes or ischemic ulcers	18
Plantar space sepsis	2
Failure of previous operation	
Nonhealing toe amputations	2
Previous femoro-popliteal bypass (3 mo) (24 hr)	3
Septic prosthesis thrombosed	1

TABLE 2

OTHER MANIFESTATIONS OF ATHEROSCLEROSIS

24 Cases	
Arteriosclerotic heart disease	21
Cerebrovascular accidents	3
Diabetes	15
Atherosclerosis of opposite leg	
Occlusions of femoral or popliteal artery	24
Amputations of opposite leg (AK)	2
Previous lumbar sympathectomy	2

Severe arteriosclerosis was present in both legs of all patients. Two had had previous major amputations, one above the knee and the other below. Two had had previous bilateral lumbar sympathectomies.

Arteriograms revealing the abdominal aorta and iliac arteries, as well as both femoral arteries and their outflow, were performed in all cases. Occlusions of the opposite femoral or popliteal arteries or both were found in all patients. Inflow via the aorta and iliac arteries was adequate in all but two patients who required a bypass prosthesis from the opposite femoral artery prior to the long vein graft.

Extensive arteriosclerosis was present in the operated leg with occlusions of both the femoral and popliteal arteries in almost all patients. All operations were elective except in two patients in whom femoral-popliteal bypass vein grafts had thrombosed acutely. Several patients needed preliminary procedures to drain infection. A septic prosthesis was removed prior to the long graft in one case.

Technique

Arteriography

Complete arteriography furnished a map of the distal abdominal aorta and its branches, as well as both thighs and legs, including detailed films of the involved leg, ankle and foot.

A 160 Seldinger needle is introduced into the common femoral artery on the involved side, and the first injection is 40 cc of 60% iothalamate meglumine (Conray) at a pressure of 225 lb per square inch or at a rate of 20 cc per second. This refluxes proximally into the terminal aorta and then down both iliacs and into the thighs. Films of the abdomen, thighs and legs are exposed at subsequent intervals. An automatic rapid film changer is helpful.

Details of the popliteal artery outflow and the lower leg and foot are revealed after slower injection by hand for 5 seconds using 30 cc of 60% Conray. The injected dye perfuses through the collateral vessels to fill the calf and foot in 20 to 30 seconds in most cases. A third injection of 20 cc of contrast medium occasionally is needed with the changer underneath the foot and distal leg. Films are obtained every 2 seconds for 16 seconds (eight pictures) starting 15 seconds after the dye injection is initiated.

It is important to obtain x-rays of the foot and ankle region in the lateral as well as the A-P projection. On several occasions, a good dorsalis pedis artery was seen in the lateral projection that was obscured in the A-P view by the overlying tarsal bones. The refilling of the distal leg arteries may be very slow when the proximal segments of these arteries are occluded. A total dose of 150 cc to 200 cc of Conray 60% has been well tolerated.

Venous bypass grafts to the distal tibial or peroneal arteries or their branches were performed for ischemic rest pain, gangrenous toes or ulcers in 24 patients during the past seven years. The average age of the patients was 72. The authors report that 15 of 24 patients are patent and walking and show that, by careful selection of patients, amputations can be prevented and many patients rehabilitated by this technique. The authors are from the Department of Surgery, St. John's Mercy Hospital.

Site of Distal Anastomosis

Table 3 shows the site of the distal anastomoses. Good arteriograms make it unnecessary to explore doubtful portions of the artery. In a few cases, calcification, fragility or "beading" not seen on the films made it necessary to extend the incision distally. Complete and thorough arteriograms are a good guide to the operative site, and there has been excellent correlation with the findings at operation.

TABLE 3

SITES OF DISTAL ANASTOMOSES

	Distal Anastomosis (Outflow)		
	ANTERIOR TIBIAL	POSTERIOR TIBIAL	PERONEAL
Upper *	7	2	3
Lower	x	6	1
Foot (Dorsalis pedis)	5	x	x

* Distal to the trifurcation

The anastomosis is made at the mid-portion of the most normal part of the longest open segment of the distal tibial, peroneal or dorsalis pedis arteries. It is encouraging when one or more main trunks extend onto the foot, but discontinuity at the ankle is not a contraindication. One satisfactory artery has been sufficient for anastomosis and salvage of the foot. Most vessels have been at least 2 mm, but smaller diameter of the outflow has not been a contraindication; in five cases, the only suitable artery was the dorsalis pedis artery on the foot. The posterior tibial artery is most accessible at the ankle, but we have not hesitated to insert the graft in its deeper portion in the mid-calf and suspect the outflow via numerous muscular branches may be better at this location than at the ankle.

The peroneal artery sometimes is the only open outflow and may extend onto the foot. The anterior tibial artery occluded in its upper portion may be slow to fill via collaterals through the skin or calf muscle.

Proximal Anastomosis

The proximal anastomosis in 18 of the 24 patients was performed at the common femoral artery. At the site of anatomosis, thrombo-endarterectomy corrected stenoses of the common

femoral artery, the profunda or proximal superficial femoral artery. Detection and correction of these stenoses assured adequate outflow through the profunda artery as well as insuring adequate inflow for the bypass. Patch angioplasty was performed in six patients (Table 4). These plaques on the posterior wall are not detectable in the usual antero-posterior arteriograms. Two patients had complete occlusion of the external iliac and common femoral arteries and were very poor operative risks. Inflow to the vein graft and profunda was brought across from the opposite common femoral artery by inserting a prosthesis subcutaneously across the pubis. These prostheses were inserted over the common femoral bifurcation and profunda, and the vein graft was attached to the short endarterectomized segment of superficial femoral artery (Table 4).

The superficial femoral artery is a suitable site for the proximal anastomosis in cases of popliteal aneurysm or trauma. A normal superficial femoral artery was suitable for the proximal anastomosis in six cases (Table 4). Because past experience has shown that atherosclerosis in the superficial femoral artery usually progresses upward and occludes its origin, the best inflow for the graft is usually the common femoral artery.

Procurement of Vein Graft

The length of vein graft should not dictate the sites of anastomosis because sufficient length of veins of adequate caliber can almost always be obtained. Sometimes, this required splicing segments from the opposite leg or the arm. Unsatisfactory vein grafts are an avoidable cause of failure. The long saphenous vein is removed from the ankle to the groin in all cases. When, as occasionally occurred, it is doubled, narrow or otherwise unsuitable in the mid-portion about the knee, this part is excised and discarded. If the dorsalis pedis artery is to be used for the distal anastomosis, the saphenous vein must be dissected out distally to the tarsal-metatarsal region (Table 5).

To begin the operation, both surgeons start a long continuous incision from the ankle and the groin. They trace the vein simultaneously from above and below. Do not undermine the skin edges. If the vein is doubled, excise the edge of undermined skin to prevent delayed healing or sloughing. After reversal and anastomosis, the vein is usually placed in its deep subcutaneous bed in the thigh, or, in a thin leg, make a tunnel deep to the santorius in the mid-thigh. The tunnel for the vein below the knee varies with the site of distal anastomosis, as described later.

Team Work

The operation is expedited when two surgeons operate simultaneously. Surgeons A and B procure the vein graft together. While one prepares the vein, the other exposes and opens the common femoral artery and performs a local endarterectomy when necessary. While Surgeon A performs the proximal anastomosis, Surgeon B prepares the distal artery. During the distal anastomosis, the proximal incisions are closed. The proximal anastomosis is made first so that when the clamps are released, the vein graft is distended and lengthened under pressure prior to its insertion distally.

Surgical Exposure of the Distal Posterior Tibial Artery

The posterior tibial artery is most accessible, so it is preferred when it is suitable. At the ankle, it is superficial. The posterior tibial artery in the calf is deeper and is surrounded by paired veins with cross connections and many

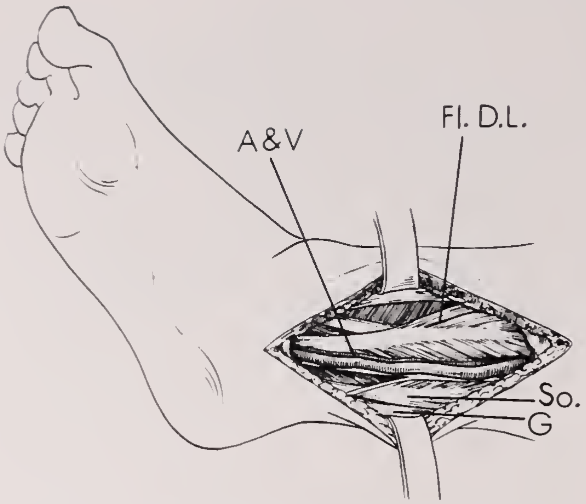

Fig. 1 Surgical anatomy of the posterior tibial artery. A. & V.: artery and veins. Fl.D.L.: flexor digitorum longus. So.: soleus muscle. G.: gastrocnemius muscle.

tributaries. Good arteriograms, however, avoid needless dissection. We suspect that the collateral circulation through the various muscle branches is more abundant than the subcutaneous collateral in the ankle and foot or close to the atherosclerotic trifurcations. Fig. 1 illustrates the surgical anatomy in the lower leg.

Surgical Exposure of the Peroneal Artery

The peroneal artery was the most suitable for only outflow in four patients. We approach it medially and there is no need to resect the fibula (Fig. 2). A lateral tarsal pulse may appear postoperatively as an extension of the peroneal artery into the foot. The tunnel is constructed on the medial aspect of the leg, also. We frequently divide the tendons attached to the upper medial aspect of the tibia in order to make a short direct pathway without constriction or angulation, so that the graft can be visualized in its bed prior to closure.

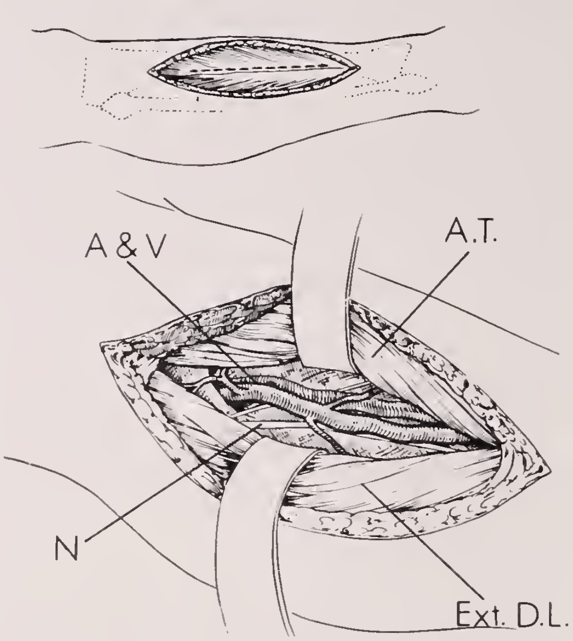

Fig. 2 Surgical anatomy of the anterior tibial artery. Dotted line is the incision through the fascia. Fibers of the anterior tibial muscles are then reflected from their origin on the intermuscular septum. A. & N.: artery and nerve (the veins are omitted). A.T.M.: anterior tibial muscles. Ext.D.L.: extensor digitorum longus muscle.

Surgical Exposure of the Anterior Tibial Artery

In seven patients, the mid-portion of the anterior tibial artery was approached through an incision in the antero-lateral aspect of the leg, separating the muscles as diagrammed in Fig. 3. Divide the cross connections between the paired veins and free up the veins from the artery for the anastomosis. Tunnel through the popliteal space and the interosseous membrane, below the head of the fibula. This avoids the veins which traverse the normal hiatus in the interosseous membrane.

Surgical Exposure of the Dorsalis Pedis Artery

The dorsalis pedis artery is superficial and readily exposed between the tendons as illustrat-

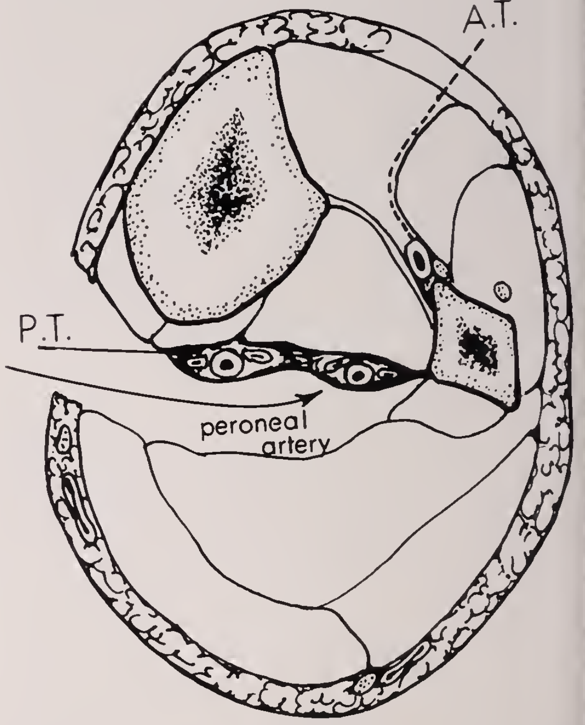

Fig. 3 Cross section of mid-leg: anterior dotted line is the route to the anterior tibial artery. P.T.: posterior tibial artery and veins. Per.: peroneal artery and veins as approached medially.

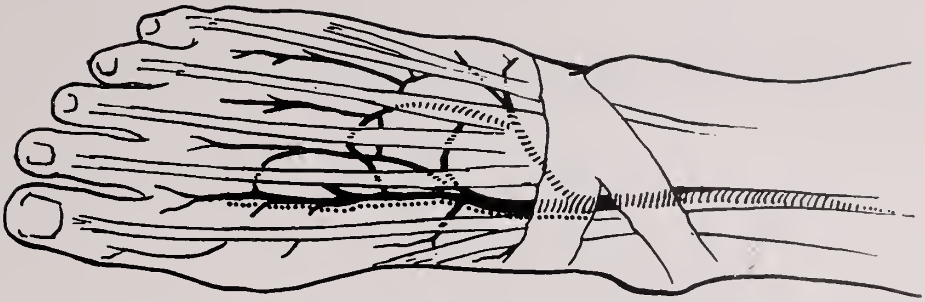

Fig. 4 Incision for the dorsalis pedis artery between the first and second metatarsal bones.

ed in Fig. 4. This was utilized in five patients in whom other vessels in the lower and mid-calf were occluded, narrowed or only short segments were open.

Technique of Distal Anastomosis

A loupe, which magnifies two and one half times, has a convenient focal length, and sufficient depth of field is used. The loupe and the elegant and delicate ophthalmic scissors and forceps have been helpful in suturing a meticulous, precise anastomosis. Five-0 monofilament polyethylene suture on a TE-1 needle glides easily through the vein and fragile arteries. The technique of suture is illustrated in Fig. 5.

End-to-side anastomoses are always used. The vein and artery are handled meticulously. Apply fine pointed pickups only on the adventitia, so as to avoid injury to the intima. Small, smooth Schwartz neurosurgical clips are used to occlude the vessels proximal and distal. We trim the vein so there are no valves close to the anastomosis. The ends of the vein are trimmed as diagrammed. These small arteries are fragile and frequently calcified so no tension is permitted on the vein graft. Mattress sutures can constrict slightly and, therefore, are not advisable in these tiny vessels. Pull the sutures through and set them carefully without buttonholing or tearing the edge of the artery. Regional heparinization is achieved by injecting 3,500 units of heparin in the common femoral artery when the proximal clamps are closed. No systemic heparin or postoperative anticoagulation or dextran have been used.

Closure

Operative arteriograms are seldom necessary but are advisable if there is any doubt about the graft or outflow. Prior to closure, examine the position of the graft in the tunnel with the knee flexed as well as straight. The vein graft must be in a roomy plane or tunnel without any angulation. Do not hesitate to divide any tendons which appear to angulate or constrict the graft in any position of the knee.

The superficial fascia of the thigh and subcutaneous tissue of the leg are closed over the vein graft with fine catgut. The skin is closed with fine continuous nylon sutures. Antibiotics are administered pre- and postoperatively when infected ulcers or gangrenous toes are present. In three patients, debridement, drainage or open toe amputation was performed at the conclusion of the bypass graft. However, if the gangrene was dry, most amputations were delayed for seven to ten days.

Results

We are reporting results in 24 patients with femoral-tibial, peroneal or dorsalis pedis bypass vein grafts.

There were six early failures while the patients were in the hospital (by either thrombosis or death) and all occurred within five days of

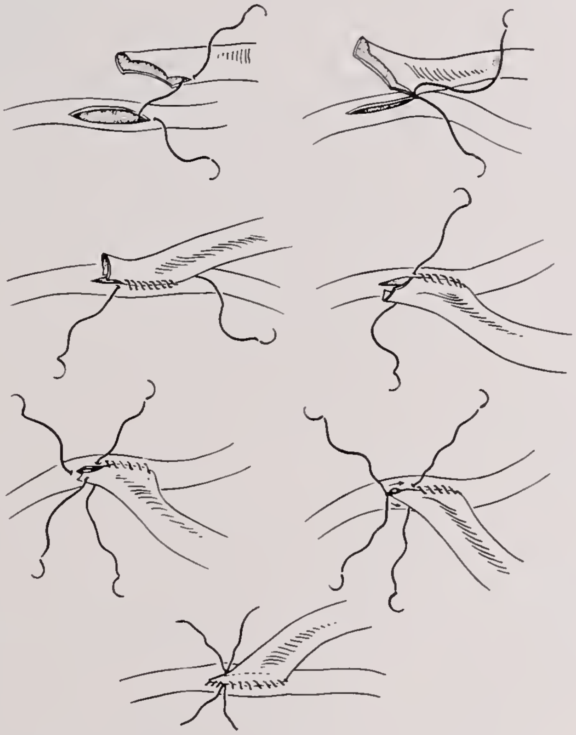

Fig. 5 Technique of end-to-side anastomosis of vein graft to small arteries.

the bypass operation. This is an early success rate of 75%. Three of these six patients died, so the surgical mortality is 12.5%. Of these three deaths, one died of a myocardial infarction with a functioning graft; two died after graft occlusion and major amputations.

The other three early "failures" are still alive. Two of these patients required a below-knee amputation; one had a patent graft but the amputation was necessary because of advancing Bacillus proteus infection. The third is still working and walking with an intact leg and foot. His graft clotted but the rest pain slowly subsided as the collateral circulation improved because of the profunda endarterectomy performed at the time of the proximal anastomosis.

Eighteen patients walked out of the hospital with patent grafts. Two of these have died subsequently at three and 15 months after surgery; one died from renal failure and severe myocardial disease, and the other died of bladder carcinoma. Both patients had patent grafts at the time of their death. A third patient had a graft closure after 6½ years and needed a below-knee amputation. He was grateful for the 6½-year respite because the opposite leg had been amputated many years earlier.

Therefore, at present, subtracting our six early failures and three late ones gives a current patency rate of 15/24 or 62.5%.

All of the discharged (18) patent graft patients had healed feet and relief of ischemic rest pain. In several cases, severe long-standing ischemic neuritis took several months to subside. Several had mild to moderate temporary ankle edema. Superficial gangrene healed in all cases. All toe amputations healed without difficulty. A total of 12 toes were removed in eight patients; three of these were transmetatarsal and the others proximal transphalangeal. In four patients, a toe or toes were amputated as debridement and were left open for drainage. Others were removed electively seven to ten days after the vein graft and closed primarily (Table 6).

Brief narratives of the hospital deaths follow:

Case Reports

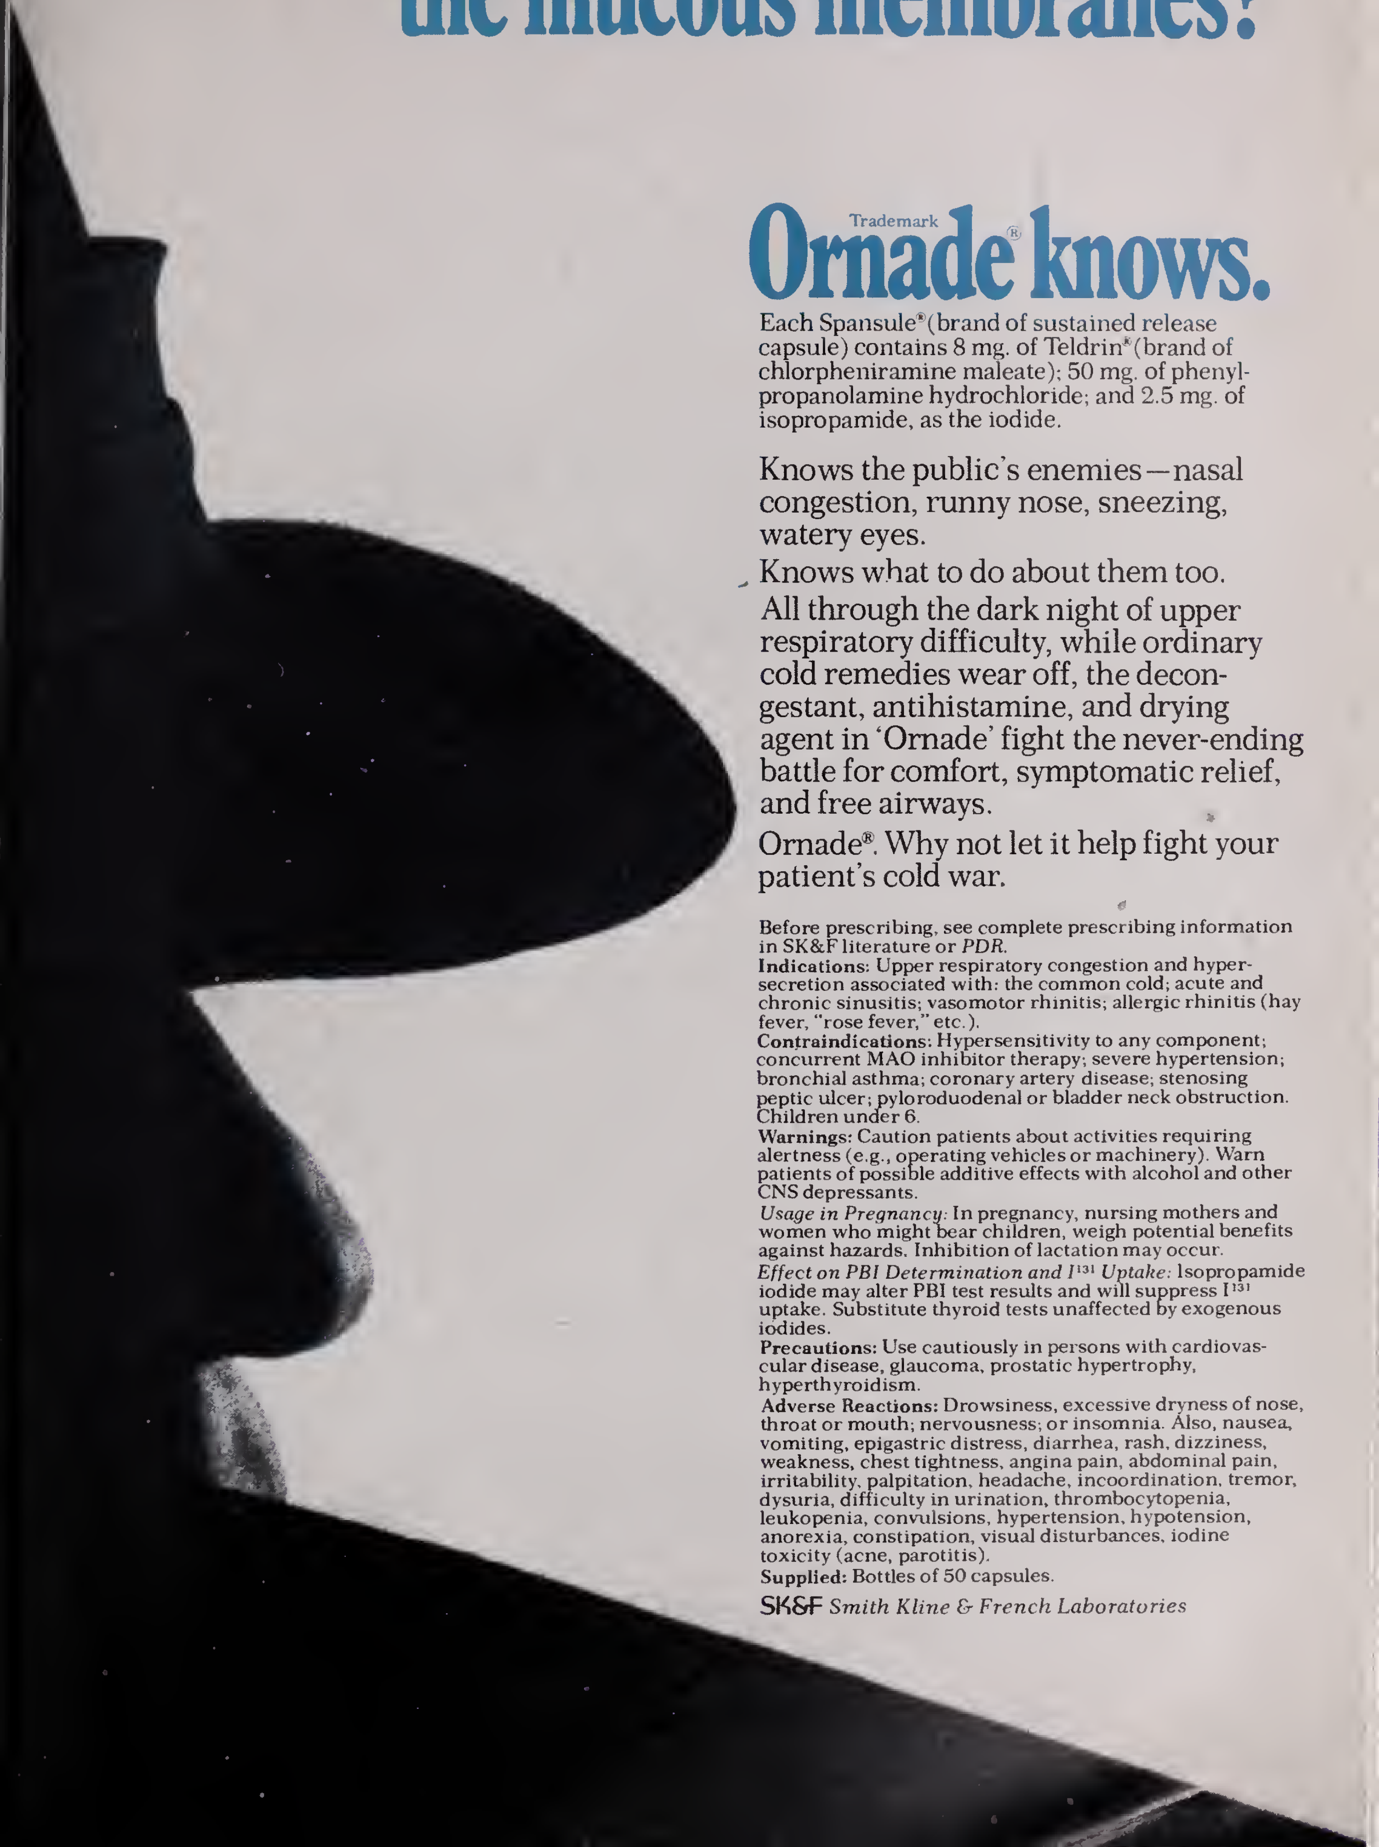
Case # 1. A 65-year-old diabetic man required narcotics for severe pain due to gangrene of two toes and a deep ulcer of the heel. A long graft from the common femoral artery to the posterior tibial artery at the ankle disrupted due to excessive tension on the graft. Another segment was added to the vein graft, and a new anastomosis was completed. Four days postoperatively, the graft clotted, ischemic pain returned and amputation below the knee was necessary. He died suddenly of myocardial infarction 13 days after amputation.

Case # 2. A 79-year-old diabetic woman had severe pain due to a gangrenous ulcer of the fourth toe. Local amputation failed when sepsis developed in a tendon sheath. This was drained but would not heal. A femoro-popliteal vein graft to a stenotic distal popliteal artery clotted within 24 hours. At reoperation, the thrombosis in the graft had extended into the popliteal and anterior tibial arteries. After thrombectomy, the previous graft was lengthened with a new segment from the opposite thigh and a new anastomosis performed on the anterior tibial artery in the mid-leg. This occluded four days later. Infection developed in the incisions and later in the amputated stump, and she died ultimately of septicemia and pneumonia from the resistant organisms.

Case # 3. A 68-year-old diabetic man required narcotics for severe pain due to gangrene of the right great toe. A femoral-popliteal bypass vein graft was performed. The vein was short and, therefore, placed on a distal popliteal artery with poor outflow. A short narrow distal segment of the vein graft was not resected. The graft thrombosed in a few hours. At reoperation, thrombectomy with Fogarty catheters reopened the graft which was then lengthened with another segment of vein and anastomosed to the posterior tibial artery at the ankle. In addition, the narrow segment of vein was resected. The patient died three days later from a myocardial infarction with a functioning graft, free of pain and with a warm foot.

Four of the 24 grafts that thrombosed in the hospital plus the one at 6½ years required major amputation, four BK and one AK. The other two with early failures did not have amputations. One man died from a myocardial infarction. Even though his graft was working, he is

Who knows what evil lurks in the mucous membranes?



Trademark Ornade® knows.

Each Spansule®(brand of sustained release capsule) contains 8 mg. of Teldrin®(brand of chlorpheniramine maleate); 50 mg. of phenylpropanolamine hydrochloride; and 2.5 mg. of isopropamide, as the iodide.

Knows the public's enemies—nasal congestion, runny nose, sneezing, watery eyes.

Knows what to do about them too.

All through the dark night of upper respiratory difficulty, while ordinary cold remedies wear off, the decongestant, antihistamine, and drying agent in 'Ornade' fight the never-ending battle for comfort, symptomatic relief, and free airways.

Ornade®. Why not let it help fight your patient's cold war.

Before prescribing, see complete prescribing information in SK&F literature or *PDR*.

Indications: Upper respiratory congestion and hypersecretion associated with: the common cold; acute and chronic sinusitis; vasomotor rhinitis; allergic rhinitis (hay fever, "rose fever," etc.).

Contraindications: Hypersensitivity to any component; concurrent MAO inhibitor therapy; severe hypertension; bronchial asthma; coronary artery disease; stenosing peptic ulcer; pyloroduodenal or bladder neck obstruction. Children under 6.

Warnings: Caution patients about activities requiring alertness (e.g., operating vehicles or machinery). Warn patients of possible additive effects with alcohol and other CNS depressants.

Usage in Pregnancy: In pregnancy, nursing mothers and women who might bear children, weigh potential benefits against hazards. Inhibition of lactation may occur.

Effect on PBI Determination and I^{131} *Uptake:* Isopropamide iodide may alter PBI test results and will suppress I^{131} uptake. Substitute thyroid tests unaffected by exogenous iodides.

Precautions: Use cautiously in persons with cardiovascular disease, glaucoma, prostatic hypertrophy, hyperthyroidism.

Adverse Reactions: Drowsiness, excessive dryness of nose, throat or mouth; nervousness; or insomnia. Also, nausea, vomiting, epigastric distress, diarrhea, rash, dizziness, weakness, chest tightness, angina pain, abdominal pain, irritability, palpitation, headache, incoordination, tremor, dysuria, difficulty in urination, thrombocytopenia, leukopenia, convulsions, hypertension, hypotension, anorexia, constipation, visual disturbances, iodine toxicity (acne, parotitis).

Supplied: Bottles of 50 capsules.

SK&F *Smith Kline & French Laboratories*

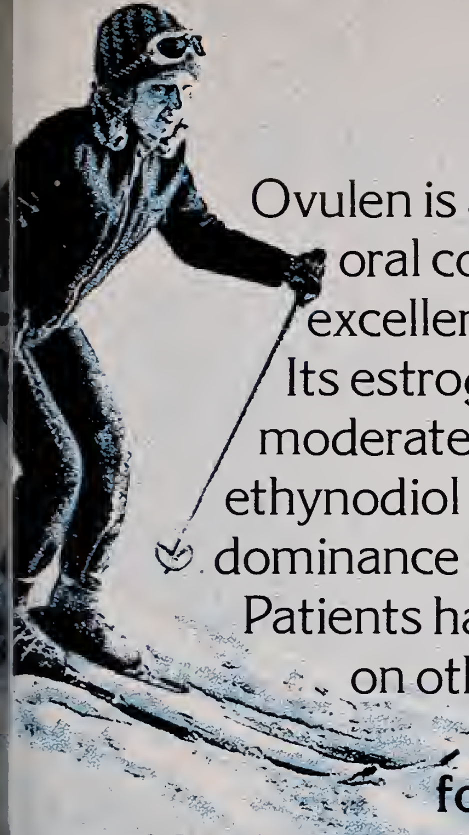
Note: Oral contraceptives are complex medic
They should be prescribed with care on
reference to the prescribing informatio

For brief summary of prescribing information, please see next page.

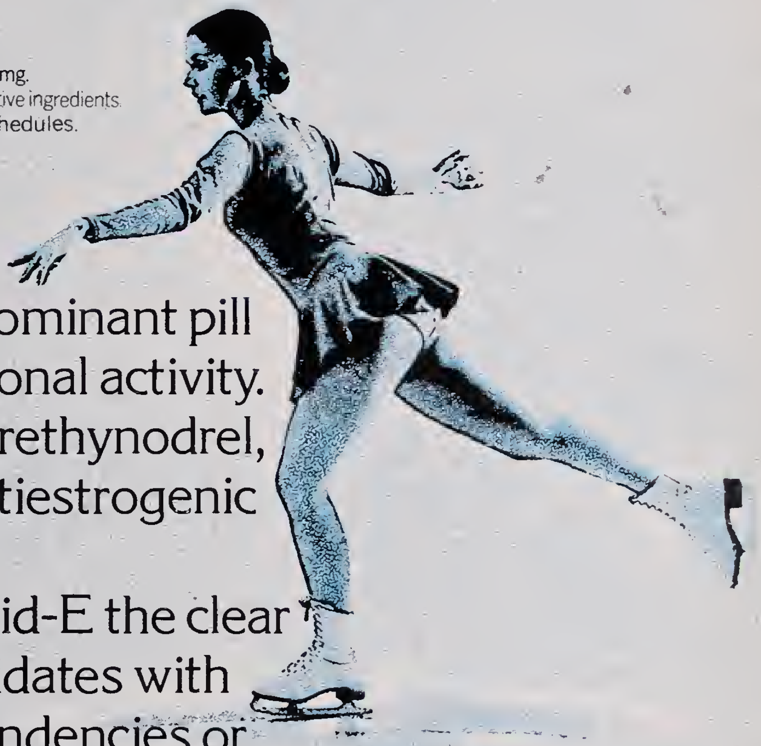


Ovulen is a well-balanced oral contraceptive with an excellent record of patient acceptance. Its estrogen, 100 mcg. of mestranol, is relatively moderate in activity. Its 1 mg. of progestogen, ethynodiol diacetate, gives it a slight dominance in progestational activity. Patients having problems on other pills often do well on Ovulen.

for balanced profiles, with normal menstruation

Ovulen®

Each white tablet contains: ethynodiol diacetate 1 mg./mestranol 0.1 mg.
pink tablet in Ovulen-28® and Demulen-28® is a placebo, containing no active ingredients.
Both Ovulen and Demulen are available in 21- and 28-pill schedules.



Enovid-E is an estrogen-dominant pill with low progestational activity. Its unique progestogen, norethynodrel, is estrogenic and is not antiestrogenic or androgenic in activity. This probably makes Enovid-E the clear choice for those "pill" candidates with ne, hirsutism, masculine tendencies or apparent estrogen deficiency.

for excessive ovarian androgen/ low-estrogen profiles

Enovid-E®

Each tablet contains: norethynodrel 2.5 mg./mestranol 0.1 mg.

Ovulen®

Each white tablet contains
ethynodiol diacetate 1 mg / mestranol 0.1 mg

Demulen®

Each white tablet contains.
ethynodiol diacetate 1 mg / ethinyl estradiol 50 mcg

Each pink tablet in Ovulen-28® and Demulen-28® is a placebo, containing no active ingredients.

Actions – Ovulen and Demulen act to prevent ovulation by inhibiting the output of gonadotropins from the pituitary gland. Ovulen and Demulen depress the output of both the follicle-stimulating hormone (FSH) and the luteinizing hormone (LH).

Special note – Oral contraceptives have been marketed in the United States since 1960. Reported pregnancy rates vary from product to product. The effectiveness of the sequential products appears to be somewhat lower than that of the combination products. Both types provide almost completely effective contraception.

An increased risk of thromboembolic disease associated with the use of hormonal contraceptives has now been shown in studies conducted in both Great Britain and the United States. Other risks, such as those of elevated blood pressure, liver disease and reduced tolerance to carbohydrates, have not been quantitated with precision.

Long-term administration of both natural and synthetic estrogens in subprimate animal species in multiples of the human dose increases the frequency of some animal carcinomas. These data cannot be transposed directly to man. The possible carcinogenicity due to the estrogens can be neither affirmed nor refuted at this time. Close clinical surveillance of all women taking oral contraceptives must be continued.

Indication – Ovulen and Demulen are indicated for oral contraception.

Contraindications – Patients with thrombophlebitis, thromboembolic disorders, cerebral apoplexy or a past history of these conditions, markedly impaired liver function, known or suspected carcinoma of the breast, known or suspected estrogen-dependent neoplasia and undiagnosed abnormal genital bleeding.

Warnings – The physician should be alert to the earliest manifestations of thrombotic disorders (thrombophlebitis, cerebrovascular disorders, pulmonary embolism and retinal thrombosis). Should any of these occur or be suspected the drug should be discontinued immediately.

Retrospective studies of morbidity and mortality conducted in Great Britain and studies of morbidity in the United States have shown a statistically significant association between thrombophlebitis, pulmonary embolism, and cerebral thrombosis and embolism and the use of oral contraceptives. There have been three principal studies in Britain[1-3] leading to this conclusion, and one[4] in this country. The estimate of the relative risk of thromboembolism in the study by Vessey and Doll[3] was about sevenfold, while Sartwell and associates[4] in the United States found a relative risk of 4.4, meaning that the users are several times as likely to undergo thromboembolic disease without evident cause as nonusers. The American study also indicated that the risk did not persist after discontinuation of administration and that it was not enhanced by long-continued administration. The American study was not designed to evaluate a difference between products. However the study suggested that there might be an increased risk of thromboembolic disease in users of sequential products. This risk cannot be quantitated and further studies to confirm this finding are desirable.

Discontinue medication pending examination if there is sudden partial or complete loss of vision, or if there is a sudden onset of proptosis, diplopia or migraine. If examination reveals papilledema or retinal vascular lesions medication should be withdrawn.

Since the safety of Ovulen and Demulen in pregnancy has not been demonstrated, it is recommended that for any patient who has missed two consecutive periods pregnancy should be ruled out before continuing the contraceptive regimen. If the patient has not adhered to the prescribed schedule the possibility of pregnancy should be considered at the time of the first missed period.

A small fraction of the hormonal agents in oral contraceptives has been identified in the milk of mothers receiving these drugs. The long-range effect to the nursing infant cannot be determined at this time.

Precautions – The pretreatment and periodic physical examinations should include special reference to the breasts and pelvic organs, including a Papanicolaou smear since estrogens have been known to produce tumors, some of them malignant, in five species of subprimate animals. Endocrine and possibly liver function tests may be affected by treatment with Ovulen or Demulen. Therefore if such tests are abnormal in a patient taking Ovulen or Demulen, it is recommended that they be repeated after the drug has been withdrawn for two months. Under the influence of progestogen-estrogen preparations preexisting uterine fibromyomas may increase in size. Because these agents may cause some degree of fluid retention, conditions which might be influenced by this factor, such as epilepsy, migraine, asthma, cardiac or renal dysfunction, require careful observation. In breakthrough bleeding, and in all cases of irregular bleeding per vaginam, nonfunctional causes should be borne in mind. In undiagnosed bleeding per vaginam adequate diagnostic measures are indicated. Patients with a history of psychic depression should be carefully observed and the drug discontinued if the depression recurs to a serious degree. Any possible influence of prolonged Ovulen or Demulen therapy on pituitary, ovarian, adrenal, hepatic or uterine function awaits further study. A decrease in glucose tolerance has been observed in a significant percentage of patients on oral contraceptives. The mechanism of this decrease is obscure. For this reason, diabetic patients should be carefully observed while receiving Ovulen or Demulen therapy. The age of the patient constitutes no absolute limiting factor, although treatment with Ovulen or Demulen may mask the onset of the climacteric. The pathologist should be advised of Ovulen or Demulen therapy when relevant specimens are submitted. Susceptible women may experience an increase in blood pressure following administration of contraceptive steroids.

Adverse reactions observed in patients receiving oral contraceptives – A statistically significant association has been demonstrated between use of oral contraceptives and the following serious adverse reactions: thrombophlebitis, pulmonary embolism and cerebral thrombosis.

Although available evidence is suggestive of an association, such a relationship has been neither confirmed nor refuted for the following serious adverse reactions: neuro-ocular lesions, e.g., retinal thrombosis and optic neuritis.

The following adverse reactions are known to occur in patients receiving oral contraceptives: nausea, vomiting, gastrointestinal symptoms (such as abdominal cramps and bloating), breakthrough bleeding, spotting, change in menstrual flow, amenorrhea during and after treatment, edema, chloasma or melasma, breast changes (tenderness, enlargement and secretion), change in weight (increase or decrease), changes in cervical erosion and cervical secretions, suppression of lactation when given immediately post partum, cholestatic jaundice, migraine, rash (allergic), rise in blood pressure in susceptible individuals and mental depression.

Although the following adverse reactions have been reported in users of oral contraceptives, an association has been neither confirmed nor refuted: anovulation post treatment, premenstrual-like syndrome, changes in libido, changes in appetite, cystitis-like syndrome, headache, nervousness, dizziness, fatigue, backache, hirsutism, loss of scalp hair, erythema multiforme, erythema nodosum, hemorrhagic eruption and itching.

The following laboratory results may be altered by the use of oral contraceptives: hepatic function: increased sulfobromophthalein retention and other tests; coagulation tests: increase in prothrombin, Factors VII, VIII, IX and X; thyroid function: increase in PBI and butanol extractable protein bound iodine, and decrease in T^3 uptake values; metyrapone test and pregnanediol determination.

Enovid-E®

norethynodrel 2.5 mg / mestranol 0.1 mg

Actions – Enovid-E acts to prevent ovulation by inhibiting the output of gonadotropins from the pituitary gland. Enovid-E depresses the output of both the follicle-stimulating hormone (FSH) and the luteinizing hormone (LH).

Indication – Enovid-E is indicated for oral contraception.

The *Special Note, Contraindications, Warnings, Precautions* and *Adverse Reactions* listed above for Ovulen and Demulen are applicable to Enovid-E and should be observed when prescribing Enovid-E.

Enovid-E®

brand of norethynodrel with mestranol

Where "The Pill" Began

listed as a failure. The other case mentioned earlier developed collaterals from the profunda endarterectomy performed at the time of the bypass vein graft. His pain abated and the leg survived.

Some failures may be avoidable. In two patients, a femoral-popliteal graft thrombosed in 24 hours because of poor outflow. The reoperation could have been avoided if the long graft had been the initial procedure. We no longer anastomose vein grafts to "isolated popliteal artery segments." Excessive tension on the vein and the anastomosis is avoidable. Segments of vein less than 4 mm in diameter should be resected and sufficient vein obtained to splice together for adequate length.

Functioning grafts have permitted control of infection in all but one patient who needed a BK amputation to control advancing plantar space sepsis due to a B. Proteus infection. The same complication occurs in occasional diabetics with good pulses and no major arterial occlusions.

Cumulative patency rates[1] are shown in Table 7. Follow-up is still relatively short for most cases. Open grafts are obvious because of strong palpable pulses. Arteriograms have been performed at various intervals postoperatively in nine cases.

TABLE 7

LATE PATENCY

Months at Risk	*Patients at Risk*	Treatment SUCCESS	Treatment FAILURE	*Accumulative Success Rate (%)*
0- 3	24	18	6*	75% (18/24)
4- 6	15	15	0	75%
7- 9	13	13	0	75%
10-12	10	10	0	75%
13-15	7	7	0	75%
16-18	6	6	0	75%
19-21	2	2	0	75%
22+	1	1	0	75%

* These failures less than four days postoperatively.

Discussion

Our technique differs somewhat,[2, 3] as discussed later, but our results are similar to other series reported.[4–8] Follow-up is short, but the procedure deserves further trial. Eighteen of 24 legs were saved; the risks are modest and will be reduced with further experience.

In these cases, the legs were in peril as signified by ischemic pain at rest. Ischemic pain is always an ominous sign. Many cases also had nonhealing ischemic ulcers or gangrene of the toes.

These patients are poor risks for any operation because of their widespread atherosclerosis. They are poor risks for amputation as well as for revascularization. No amputation is performed on our service without detailed arteriograms to map the arteries of the lower leg and foot. If there are no contraindications and if a suitable artery is present, the distal bypass vein graft can be performed with equal or less risk than a major amputation. Two of our deaths occurred early in our experience when the distal bypass was performed only after popliteal bypass grafts had thrombosed due to poor outflow. Two operations are more risky than one and less likely to succeed when the thrombosis, as in one case, extended into the arteries in the upper calf. In similar cases today with poor popliteal outflow, we have found a more suitable site for anastomosis in the lower leg.

Risk can be reduced and success increased by avoiding technical errors. Disruption of the suture line because of tension occurred in one of our cases. This is avoidable when sufficient length of vein graft can be obtained, and we do not hesitate to splice veins from the arm or opposite leg. Segments of vein graft less than 4 mm in diameter are undesirable. This was a probable cause of another failure in the present series of cases and should have been corrected at the first operation. Sufficient vein of adequate caliber can almost always be found. Cephalic and brachial veins are suitable.

The peroneal artery is useful and accessible via the medial approach without resection of the fibula. Lateral tunnels in the thigh and lower leg have been unnecessary for the anterior tibial grafts. We do not perform dilatation of the arteries at the site of anastomosis. It seems hazardous and unnecessary to us.

Some questions can be answered only by longer follow-up, but it appears clear already that early failure is primarily technical and is not affected by the distance between the proximal and distal anastomosis, severity of the ischemia, diabetes or the site of implantation. Our results in the diabetics are similar to the nondiabetics.

In addition to a satisfactory vein, the other requirement for success is adequate inflow and outflow. In two cases, the iliac artery was occluded so that adequate inflow was obtained from the opposite iliac artery by means of a subcutaneous femoral-femoral prosthesis. The atherosclerosis is widespread in these patients but in all the others, the common femoral and iliac arteries were open. Local endarterectomy of the profunda femoris artery in one case improved the collateral flow, relieved the rest pain and healed an ischemic ulcer despite early thrombosis of the femoral-tibial vein graft. Other cases of early thrombosis ended with death or amputation.

Operative arteriograms show prompt filling of the calf and foot, and outflow is excellent despite the small size of the distal tibial or pedal arteries at the site of anastomosis. Measurements of flow by Bernhard[9] have shown this quantitatively. Retrograde as well as distal outflow is desirable. In one pedal anastomosis, which is still open, the recent arteriogram showed only retrograde flow. The length of the vein graft has no influence on the outflow or on the long-term results.

Our present policy is to attach the graft to the midportion of the longest segment of open tibial or peroneal artery. Outflow improves postoperatively with the development of collateral pathways as well as dilation of the recipient artery proximally and distally. Although we have not used sympathectomy, it may be a help to increase the outflow bed.

The optimum site for the distal anastomosis is still unproven. It would be desirable to insert the grafts where any subsequent progression of the atherosclerosis will cause the least harm. Autopsy arteriograms[10] of the legs show that plaques are more frequent and are larger at large bifurcations, including the popliteal branches and in the adductor canal. Data regarding the pattern of plaques and thrombosis in the distal tibial and pedal arteries is scanty, but Wessler[11] has shown that these vessels are frequently open and occasionally normal in legs amputated because of proximal occlusions. Distal anastomosis avoids progressive plaques at the origins of the main branches of the popliteal artery. Inflow to the vein grafts attached on the common femoral artery are less likely to be reduced by the usual progression of atherosclerosis upward in the femoral as reported by Warren *et al.*[12]

Clearly, longer follow-up is needed. Arteriograms at intervals up to 1½ years have been performed in nine cases so far. Longer follow-up and more arteriograms are needed to develop the patterns of atherosclerosis in the lower leg and foot, and the ultimate fate of these vein grafts.

The operation deserves further trial and is advised for patients in whom it can be performed with good prospects of early success with no greater risk than the otherwise inevitable amputation, provided that they have a reasonable life expectancy and their general medical condition will permit ambulation. The only other contraindications are a recent myocardial infarction or renal failure.

CONCLUSIONS

By careful selection of cases, long bypass vein grafts from the common femoral to small arteries beyond the popliteal trifurcation can avoid major amputation, heal ischemic ulcers and gangrenous toes and relieve rest pain from ischemic neuritis. In this regard, there is no difference in risks and successes between the diabetic and nondiabetic patient. Detailed late arteriograms frequently reveal the posterior tibial, peroneal, anterior tibial or dorsalis pedis artery to be suitable for an anastomosis. Veins from the arms or opposite leg can be spliced to reach an optimum site distally. The risks seem modest, and, so far, all patients have preferred this attempt instead of amputation.

Treatment of Intracranial Metastatic Lesions

In the consideration of brain tumors, an obvious classification is into two large groups, primary and metastatic. The primary group then can be subdivided into gliomas, which represent about 50% of intracranial tumors,[1] and the remainder of the primary tumors, such as meningiomas, neurilemmomas and pituitary tumors. The consideration of the primary tumors will be dismissed for the remainder of the discussion.

The group of tumors we shall now discuss are the metastatic. Following our rather simple classification as we have just done with the primary tumors, the metastatic can be subdivided into bronchogenic, which is the most common and represents about one fourth of metastatic brain tumors,[2] and others. These categories constitute the main groupings of all intracranial neoplasms.

Thus, the first point of clinical importance in the metastatic tumors is their high incidence. Reported incidences of intracranial metastases varies from 20%[3, 4] to 40%[5] of all intracranial neoplasms. The next point is that a significant number of these tumors are single metastases and, as such, make the patients possibly good operative candidates. Most would agree that it is futile to operate upon a patient with multiple metastatic intracranial lesions and expect good results or a substantial benefit. Regarding single lesions, in the most recent large series which was reported from Duke University by Vieth and Odom[2] in 1965, the incidence of one metastatic nodule was 56.4%. Although drawn from a large, well-investigated series, this figure is somewhat higher than in most other reports. As they recognized, the true figure probably lies somewhere between this figure and the low figure of 30% in some autopsy series.

The selection of the patient with the single nodule depends on the total clinical evaluation, usually requiring a thorough scrutinizing of the physical examination, EEG, arteriography and brain scan. The recent improvements in brain scanning have made air studies less necessary and less frequent in the evaluation of suspected metastatic lesion, but almost every neurosurgeon has had the experience of treating multiple lesions in which the brain scan, even on review, demonstrated only one lesion.

The pattern of localization of the metastatic lesions has been studied on several occasions. Most find that the greatest distribution is in that of the middle cerebral artery,[6–8] as would be expected with an arterial embolic phenomenon. Other potential pathways are the vertebral vein complex, usually called Batson's veins. The distribution of metastases throughout the brain is roughly what one expects considering the relative weight ratio of the brain,[9] with 48.9% in middle cerebral artery distribution, 8.3% in cerebellum and 1.5% in brain stem. The weight ratio of cerebrum to cerebellum is 9:1 and cerebrum to brain stem, 45:1.[2] Carcinomatous spread through the cerebrospinal fluid also occurs on occasion with resulting "carcinomatous meningitis." However, since this could be the topic of another discussion and, obviously, is not a surgically amenable condition, we shall not consider this further.

An important aspect of the evaluation of cerebral metastases is that no manipulation be allowed that could compromise the patient's neurological status or cause deterioration. A frequent temptation is to completely assess the patient in a detailed and often dangerous method

The occurrence of a single metastatic nodule that can be treated favorably by excision is not rare. The authors report that most autopsy series demonstrate that single lesions occur in at least one third of cases of intracranial metastases. These tumors can now be treated adequately with low operative mortality and morbidity. Even if cure is not obtained, palliation is of benefit since it allows the patient to enjoy useful, enjoyable and longer survival. Doctor Bonner is Assistant Professor of Surgery and Doctor Black is Professor of Surgery, Section of Neurosurgery, University of Missouri School of Medicine.

in order to identify and localize the primary by such methods as proctoscopy, barium enema and bronchoscopy. All these have the capacity to upset what may be a delicate intracranial dynamic balance by a Valsalva maneuver or hypoxia. In addition, these studies often are unnecessary because if the patient is a candidate for potential craniotomy to remove the metastatic lesion, the primary diagnosis often can be made from the histology of the removed tumor. Also, once the mass has been removed, these diagnostic manipulations have less possible morbidity if the identity of the primary is still unclear.

The next consideration is the possible types of tumors which metastasize intracranially.

The tumors of the Duke series[2] most frequently metastasizing to the brain were as follows:

1. lung, 27%
2. breast, 16.3%
3. melanomas, 15.7%
4. those of unknown origin, 14%
5. genito-urinary system, 7%

Thyroid, gastrointestinal system tumors, skin, nasal sinus tumors and sarcomas also participate to a significant degree. Other series have shown a greater incidence of genito-urinary system tumors, especially hypernephroma.[10–12]

The high incidence of lung tumors is especially remarkable, with various autopsy series demonstrating that brain metastases in lung carcinoma occur in 17% to 53% of cases.[13, 14] Another of the features of metastases is that a large number, up to 45.4%, produce intracranial symptomatology before their primary does. This occurs especially with the lung.[15] In the University of Washington experience,[16] about 10% of bronchogenic carcinomas first manifested themselves by their intracranial metastases, with about 35% ending with metastases in the brain.

The prognosis of the patient with the single intracranial metastasis varies to a great degree according to the tumor involved. Unfortunately, the most common, the bronchogenic, has the worst prognosis with only 3% in the Duke series[2] living more than one year postoperatively. Longer survivors are certainly not unknown. We should be able to do better even with lung carcinoma, however, as good long term survival is possible. This is supported by Galluzzi[17] in an autopsy series study of lung tumors showing 36% having single metastatic lesions and 40% with the single nodule being unassociated with other metastases. If these patients could be seen sooner undoubtedly their prognosis would be better. Other survival times of more than ten years at the time of the reports have been cited with other tumors.[2]

Much can be gained from the treatment of single intracranial metastatic lesions, especially with improved anesthesia and the help of corticosteroids to decrease the marked edema which characteristically accompanies them.[18] This results in low operative morbidities with useful and functional survivors.

The patient with multiple metastases, who is obviously not an operative candidate, can often obtain remarkable improvement both subjectively and objectively using corticosteroids which decrease the associated cerebral edema. This is a double-edged sword in that once a patient has progressed to a terminal state due to the metastases, the terminal course can be shortened significantly by discontinuing the corticosteroids, which may be desirable from both the patient and family standpoint.

In summary, aggressive treatment of intracranial metastatic lesions is both feasible and desirable. Worthwhile salvaging of functional and enjoyable longevity in many cases, as well as increasing likelihood of cure in some cases, can result.

BESS UDELL, ***Kansas City***

Psychiatric Services and Alcoholics

THIS STUDY attempts to catalogue two populations of alcoholics as they relate to psychiatric treatment facilities in the Metropolitan Area of Kansas City.

Because of the complications in the study of alcoholism that are due to lack of standard definition and the undefined role of psychiatry in treatment, it was thought that research of this nature would at least establish what patterns of treatment have evolved in a large urban area with several different psychiatric facilities. Also, the characteristics of these populations are compared to gain a statistical profile of the people with alcohol problems, who either have applied for or are in treatment in one of the facilities. The results of this study are compared with other findings of similar studies.

The implications of the findings for the psychiatric community will be suggested in the discussion.

METHODOLOGY

The psychiatric facilities surveyed were The Western Missouri Mental Health Center (WMMHC), a state-supported community mental health center; the three state hospitals serving Kansas City; The Veterans Administration Hospital in Kansas City and 36 or 86% of the 42 psychiatrists in private practice in Kansas City.

Those patients who lived in the seven-county area surrounding Kansas City were counted with the majority of patients coming from Kansas City proper. Data on patients residing in Kansas were not included. The data collected are descriptive in nature and will be used to answer such questions as "Who seeks help for alcoholism? Which facilities are most frequently used by alcoholics? How do they find their way to the facilities offering this help? Do they seek this help voluntarily? Are alcoholics substantially different from other diagnostic groups who receive or apply for help at psychiatric facilities?"

To achieve understanding about the utilization of psychiatric services, there is analytic utility in studying two patient populations. The first patient population is all patients applying for psychiatric services over a year's time. This patient population will be referred to as the *One-year Applicant Population.* It should be noted that applicants rather than applications for treatment are counted. No matter how often a person might apply during a year, he will be counted only once as an applicant. The second population referred to is the *One-day Prevalence Population.* This population consists of patients in treatment on a given day. These data were collected for the year 1968. Another report of the Field Station will describe some technical considerations in greater detail. The analytic utility for using and comparing the two patient populations is derived from the fact that the one-year applicant population captures the traffic flow, short and potential long-term users, while the one-day prevalence population captures in its count not only patients recently entering treatment but, also, those who have stayed in treatment for long periods of time.

RESULTS

Service Utilization Ratio

The two populations recorded can be related by comparing the numbers in each by the diagnostic category of persons. This yields a crude indication of the length of treatment. If many applicants are recorded throughout the year for each patient in treatment on a given day, one can assume a rapid turnover and short term treatment. As indicated in Table 1, alcoholism has the highest ratio of applicants to the preva-

This article presents data concerning the clinical and sociological make-up of alcoholics applying for or in treatment in specific types of facilities in a metropolitan area. Results of the study indicate that their alcoholic "problem" has manifested itself by isolation from the family, economy and the larger society, and the referral paths are socially defined. In this particular study, psychiatric care is the only aspect of treatment considered. The authors are from The Greater Kansas City Mental Health Foundation. This work was supported by the Center for Epidemiological Studies, NIMH Contract #43-67-1324.

TABLE 1

ONE-YEAR APPLICANT/ONE-DAY PREVALENCE RATIO

Diagnostic Categories	*Ratio*
Organic brain syndromes	1.4:1.0
Schizophrenic reactions	0.9:1.0
Neuroses	2.2:1.0
Alcoholism	5.9:1.0
Personality disorders	2.2:1.0

lence population in all of the diagnostic categories.

Expressed in another way, Table 1 demonstrates that alcoholic applicants over a year's time far outnumber the alcoholics found in the one-day prevalence population in comparison with any other diagnostic category. Subsequent analysis will deal with the applicant population, unless otherwise specified.

Facilities

Traditionally, public or private charitable institutions, including those that are rehabilitative, custodial and punitive, have inherited the responsibility for dealing with alcoholism. Even though this problem has been recognized as belonging to the domain of private and public psychiatric practice, most (94%) of the alcoholics seeking professional psychiatric help in the Kansas City area in Missouri came to or were brought to public facilities.

It is obvious in Table 2 that public facilities in general and the Western Missouri Mental Health Center in particular bear the burden of providing services to alcoholics. Another way of looking at the distribution of alcoholics is shown in Table 3.

TABLE 2

ALCOHOLIC APPLICANTS FOR ONE YEAR ADULTS ONLY, BY FACILITY, NUMBER AND PERCENT

Facilities	*Applicants* NUMBER	PER CENT
Western Missouri Mental Health Center	1,092	80
State hospitals	160	12
VA hospital	24	2
Private sector	84	6
Psychiatrists		
Psychiatric hospitals		
	1,360	100

TABLE 3

PERCENTAGE OF EACH FACILITY'S APPLICANT POPULATION DIAGNOSED ALCOHOLIC ADULTS ONLY

	Applicants		
Facilities	ALCOHOLICS %	ALL OTHER APPLICANTS %	TOTAL %
Western Missouri Mental Health Center	23	77	100
State hospitals	30	70	100
VA hospitals	6	94	100
Private psychiatric sector	3	97	100
Total	15	85	100

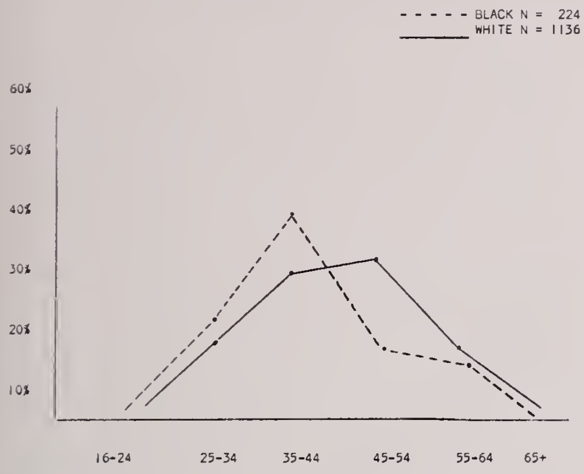
To explain why this lopsided burden falls on public facilities, one might be tempted to speculate that the diagnosis of alcoholism was influenced by social class. It might be that the private psychiatrists who see more middle class and upper middle class patients than do public facilities would be prone to give their patients a diagnosis "more acceptable" than alcoholism. However, data collected on presenting problems, problems stated by the patient and/or referral source as the reason for seeking help show that drinking problems were among the top "presenting problems" at Western Missouri Mental Health Center, but were not for private psychiatrists.

Most alcoholic applicants were middle aged: 66% of the alcoholics were between 35 and 54 years of age with the remaining 34% being evenly divided between the 18-to-34-year and the 55-and-over age groups. Black alcoholics tend to be younger than their white counterparts. Forty-three per cent of the black alcoholics were between 35 and 44 years of age and 18% were in the 45 to 54 age group, whereas 31% of the white alcoholics fell into these age groups, respectively. Seventy per cent of the black alcoholics were under 45 years of age, but only 46% of the whites were in the under-45 age group. Whether the young age of black alcoholics compared to the white alcoholics is a function of earlier onset of drinking among black applicants or results from the fact that members of minority groups are more susceptible to receive the discriminatory label of alcoholism is an unresolved question. Table 4 compares white and black alcoholics by age, using percentage rather than actual numbers to illustrate the relationship.

Of the 1,360 alcoholics in the one-year applicant population, 84% were men and only 16% were women. Male alcoholics accounted for 25% of all adult male applicants while female alco-

TABLE 4

ALCOHOLICS BY AGE GROUPS AND RACE—IN PER CENTS ONE-YEAR APPLICANT POPULATION



holics accounted for only 5% of all adult female applicants.

Blacks comprise 16% of alcoholic applicants in the seven-county area in which blacks make up 11% of the general population. They comprise 20% of alcoholic applicants at Western Missouri Mental Health Center. The ratio of white alcoholics to black alcoholics is five to one for all facilities and four to one at Western Missouri Mental Health Center. At the state hospitals, however, less than 5% of the alcoholics were black.

A slightly larger proportion of all black applicants (3% to 4%, both men and women) are diagnosed as alcoholic than are the white applicants. In discussing other variables, sex and race differences will be mentioned only when they are substantial or unexpected.

Living Arrangements and Marital Status

Although there is a good deal of variation among diagnostic groups on these two variables, alcoholics had proportionately fewer married applicants (36%) and more applicants living alone 37% than did the other diagnostic categories (Tables 5 and 6). Fifty per cent of the alcoholics were divorced, widowed or separated and only 14% were never married. The percentage of divorced, widowed or separated in the other diagnostic categories is between 20% and 26% with the exception of the Organic Brain Syndromes (OBS) diagnostic group. Applicants diagnosed as OBS, naturally, are older and more likely to be widowed than divorced or separated, in line with proportions reported for the general population.

TABLE 5

ADULT APPLICANTS DIAGNOSIS BY MARITAL STATUS
(by percentage)

	Marital Status			
Diagnostic Categories	SINGLE %	MARRIED %	DIV.-WID.-SEP. %	TOTAL %
Organic brain syndromes	14	47	39	100
Schizophrenia	29	45	26	100
Personality disorders	31	49	20	100

Diagnostic Categories	ALONE %	WITH SPOUSE %	WITH OTHERS %	UNKNOWN %	TOTAL %
Organic brain syndromes	21	43	34	2	100
Schizophrenia	19	44	34	3	100
Personality disorders	21	48	28	3	100
Alcoholism	37	34	24	5	100
Neuroses	16	60	22	2	100

In looking at source of referral for alcoholic applicants, we find that coercion plays a large role in bringing alcoholics to treatment facilities (see Table 7). Almost one third (30%) of alcoholic applicants were referred by legal agencies (police, jail, courts). For black applicants, the proportion referred by legal agencies was 50%. These figures are for all treatment facilities combined and, as such, tend to obscure the fact that while only 26% of white alcoholics overall were referred by legal agencies, one third of the white alcoholics at Western Missouri Mental Health Center were referred by legal agencies. The reason for this discrepancy is that alcoholics at the state hospitals are different from those at WMMHC. They have little chance of being referred by police since admission or commitment to a state hospital is based on a medical opinion rather than on the opinion of a police officer or jailer. In brief, the state hospital probably is not the first treatment facility with which an alcoholic has had contact but, more than likely, it is the second or third.

Another look shows that for an overall 21% of the alcoholics, the referral was "self" and for

TABLE 7

ALCOHOLICS BY REFERRAL SOURCE
(by per cent)

				Applicants			
		WHITE			BLACK		
	MALE	FEMALE	TOTAL	MALE	FEMALE	TOTAL	*Total*
	N=964	N=176	N=1,140	N=184	N=40	N=220	N=1360
Referral Source	%	%	%	%	%	%	%
Self	22	11	21	17	30	20	21
Family	14	21	16	7	0	5	14
Private doctors	8	5	7	0	0	0	6

Police	27	26	26	48	60	50	30
Unknown	22	19	21	15	0	12.5	20
	100	100	100	100	100	100	100

20%, it was “unknown.” Self-referral implies that the person came alone for help, but the records do not differentiate between being placed in a taxicab, abandoned at the front door and other ways of arriving for treatment alone. Similar speculation surrounds the group with unknown referral sources. This category most likely represents people who arrived on their “own” and were acutely intoxicated. Recording the referral pathway would be one of the remote concerns for the treatment personnel for these patients at that time.

Comparison With Other Studies

Alcoholism or excessive drinking is not restricted to any one group in society.

> “From other research, it is obvious that most excessive drinkers are not skid-row derelicts. More than 70% of them reside in respectable neighborhoods, live with their husbands or wives, try to send their children to college, belong to the country club, attend church, pay taxes, and continue to perform more or less effectively as bank presidents; housewives; farmers; salesmen; machinists; stenographers; teachers; clergymen, and physicians.”[1]

In contrast to this description, however, one finds, with a few exceptions, that the alcoholics seeking psychiatric treatment are quite different from the above description. For example, the typical alcoholic patient from this study is a male of middle age who has been but is no longer married and who is either unemployed or marginally employed. And, furthermore, the typical alcoholic in this study is comparable to the findings of other studies of treated alcoholism.

In two studies of first admissions to public mental hospitals in Ohio, Locke found higher rates of admission for alcoholic psychoses among the following: men, divorced and separated individuals, middle-aged persons and persons working as craftsmen, operatives and laborers, with the laborers having the highest rate of admissions.[2, 3]

Nathan *et al*, reporting on an alcoholism clinic in Boston, found that the applicants had characteristics similar to the applicant group reported here. In the Boston clinic, the typical patient was a middle-aged, white man who was not married but had been, and was unemployed or marginally employed.[4] In a study of a nonpsychiatric facility which deals with numerous alcoholics, a Salvation Army Men’s Social Service Center, Katz found a similar configuration of characteristics.[5]

In a study comparing five other studies on the employment characteristics of hospitalized alcoholics, Chardorkoff found that while the percentage of unemployed patients varied from hospital to hospital, the patients generally came from the lower occupational groups.[6]

While many alcoholics do have employment problems, there is evidence that many alcoholics have good work histories and that their employment problems are recent.[7] Be that as it may, studies on treatment outcomes for alcoholics generally agree that employment, being married and living with wife, and a history of having worked in a skilled or semi-skilled occupation at one time are related to successful treatment outcome.[8-10] Age also appears to affect treatment outcome in that younger alcoholics seem to respond better to inpatient treatment while older alcoholics respond better to outpatient programs.

Discussion

In discussing the findings of this study, it is necessary to emphasize the nature of the study population. We have not dealt with all alcoholics in the metropolitan area but, rather, those persons applying or in treatment in specified types at facilities.

This study offers strong evidence that the population of applicants consists of groups of persons who have been *socially* defined. These people are not a cross section of excessive drinkers but, rather, a population whose alcohol "problem" has manifested itself by isolation from the family, economy and the larger society. Also, the referral paths are socially defined. Difference by age, sex, race and social class all point to the fact that the paths to psychiatric treatment can be found in the web of social control which has developed in the urban milieu of metropolitan areas.

It is important to keep in mind that psychiatric care is only one possible aspect of treatment and the only one considered in this study.

The findings demonstrate that the public sector of psychiatry is, for all practical purposes, the psychiatric care-giver for alcoholics, because private psychiatrists infrequently deal with alcoholics. Undoubtedly, general medical practitioners encounter many alcohol-related problems in their practice and many patients are hospitalized for observation and diagnostic studies for alcohol-related conditions. Despite the fact that alcoholism is pronounced a disease, the practitioners of medicine and very likely their patients shy away from the label of chronic alcoholism on hospital charts and insurance claim forms, as a primary or secondary diagnosis.[11] This practice is not only related to avoid stigma, but also motivated by financial consideration.

Thus, moral attitudinal considerations will continue to present major obstacles for programs aimed at early treatment, the guessing game about the incidence of alcoholism in the general population will go on and data about the natural course of alcoholism will need to be obtained in indirect ways.

Public psychiatric facilities also are subject to the social implications of the label of alcoholism but in a different way from that of the private practitioners. To begin, a large number of alcoholics seeking help are in one way or another coerced into seeking treatment. Indicative of this is the larger number of applicants referred by police and family or friends.

Aside from this kind of direct coercion towards treatment for the individual alcoholic, another more indirect form of coercion takes place. Psychiatric treatment for alcoholism is much more a last resort than a treatment of choice. This form of coercion is reflected in the number of applicants who are relatively isolated socially and are having employment problems. In fact, it appears that most alcoholics do not seek treatment until their ability to function and maintain themselves in society has been severely impaired; that is, social rather than medical considerations play a large role in bringing alcoholics to psychiatric facilities. In view of this fact, treatment programs will be approached from the perspective of the social function correlates of alcoholism.

This approach is not intended to deny the importance of the medical aspects of alcoholism, however. There is still a great need for psychiatric services to deal with the acutely intoxicated alcoholic. In fact, detoxification services may be required by the bulk of the alcoholics seeking help at public facilities.

A majority of those applying for treatment in the Kansas City area and elsewhere are not prime candidates for most alcoholic programs. There is strong evidence to suggest that persons labeled as alcoholic are a diverse group and that different treatment programs with somewhat different goals should be matched with the kind of problems and potentials of the individual alcoholic. It may even be that there is need for programs that do not attempt a relatively quick "cure" but rather one aimed at decreasing the friction between the alcoholic and society which manifests itself in arrests and incarceration for drunkenness, disturbing the peace and other reasons.

IN ASTHMA
IN EMPHYSEMA

optional therapy

THE mudranes®

All Mudranes are bronchodilator-mucolytic in action, and are indicated for symptomatic relief of bronchial asthma, emphysema, bronchiectasis and chronic bronchitis. **MUDRANE tablets** contain 195 mg. potassium iodide; 130 mg. aminophylline; 21 mg. phenobarbital (Warning: may be habit-forming); 16 mg. ephedrine HCl. **Dosage** is one tablet with full glass of water, 3 or 4 times a day. **Precautions** are those for aminophylline-phenobarbital-ephedrine combinations. **Iodide side-effects:** May cause nausea. Very long use may cause goiter. Discontinue if symptoms of iodism develop. **Iodide contraindications:** Tuberculosis; pregnancy (to protect the fetus against possible depression of thyroid activity). **MUDRANE-2 tablets** contain 195 mg. potassium iodide; 130 mg. aminophylline. **Dosage** is one tablet with full glass of water, 3 or 4 times a day. **Precautions** are those for aminophylline. **Iodide side-effects and contraindications are listed above. MUDRANE GG tablets** contain 100 mg. glyceryl guaiacolate; 130 mg. aminophylline; 21 mg. phenobarbital (Warning: may be habit-forming); 16 mg. ephedrine HCl. **Dosage** is one tablet with full glass of water, 3 or 4 times a day. **Precautions** are those for aminophylline-phenobarbital-ephedrine combinations. **MUDRANE GG-2 tablets** contain 100 mg. glyceryl guaiacolate; 130 mg. aminophylline. **Dosage** is one tablet with full glass of water, 3 or 4 times a day. **Precautions:** Those for aminophylline. **MUDRANE GG Elixir.** Each teaspoonful (5 cc) contains 26 mg. glyceryl guaiacolate; 20 mg. theophylline; 5.4 mg. phenobarbital (Warning: may be habit-forming); 4 mg. ephedrine HCl. **Dosage:** Children, 1 cc for each 10 lbs. of body weight; one teaspoonful (5 cc) for a 50 lb. child. Dose may be repeated 3 or 4 times a day. Adult, one tablespoonful, 4 times daily. All doses should be followed with ½ to full glass of water. **Precautions:** See those listed above for Mudrane GG tablets.

MUDRANE—original formula

First choice

MUDRANE-2

When ephedrine is too exciting or is contraindicated

MUDRANE GG

During pregnancy or when K.I. is contraindicated or not tolerated

MUDRANE GG-2

A counterpart for Mudrane-2

MUDRANE GG ELIXIR

For pediatric use or where liquids are preferred

Clinical specimens available to physicians.

President's Message

The predicted hubbub and furor over the NBC-televised program "What Price Health?" on Tuesday, Dec. 19, 1972 at 9 PM (CST) evolved as anticipated. Probably the most responsive action was taken by the Oklahoma State Medical Society which sent telegrams to the other 49 state organizations urging them (and the AMA) to demand equal time under the Fain Fairness Doctrine. Calling it a "distorted presentation," they recommended immediate national and local action. The AMA replied that while the program was "propaganda, pure and simple," listener ratings were estimated to be seven to eight times as great for "Marcus Welby, M.D." heard at that same time on another network. They concluded that "It is our considered judgment that the program will generate a minimum of continuing comment unless we, by public action, elevate a dull, little-watched show to the stage of national controversy."

My own feelings were these. I felt that the medical facts and statistics cited were as accurate as the geography—"The Lowry family residing in East St. Louis, *MISSOURI.*" In the case of the young black child with the damaged heart who lived on the sixth floor of a ghetto tenement, the family had been trying to be moved to a lower floor for over a year but nothing had been accomplished. That, Mr. Newman, is the same bureaucracy or one of similar ilk which will be in charge of your health care in the event the Congress chooses National Health Insurance.

Walter T. Gunn, M.D.

The Commission on Professional and Hospital Activities is holding a Professional Activity Study (PAS) and a Medical Audit Program (MAP) on Thursday, Feb. 22, 1973 at the Hilton Inn, 10330 Natural Bridge Road (across from the Airport) in St. Louis. Registration begins at 8:30 AM, followed by programs from 9 AM until 4 PM. Anyone interested in these activities should immediately contact CPHA at 1968 Green Road, Ann Arbor, Mich.

On page 49 of the Jan. 8, 1973 edition of *Newsweek*, there is an article on the Federal Drug Administration. It asks the question—do these harmful effects of the more stringent standards outweigh the good effects of the "correct decisions" made by the FDA officials? The article concludes with the following sentence, "Indeed, further studies may well justify the even more shocking conclusion that the FDA itself should be abolished."

Some confusion as to the MSMA state dues has resulted from the dual billing system adopted by most of the county societies this year. The total amount is $75 of which $65 is actual dues and $10 represents the assessment for the Missouri State Medical Foundation (Medical Student Loan Fund). As of March 31, 1972, the dues are the lowest, except for three, in the 50 states. The Student Loan Fund, since its inauguration up to Dec. 15, 1972, had raised $309,588.58. Three hundred and sixty-eight medical students (all residents of Missouri) have been aided. Seventy-nine have repaid their loans in full. The total repayments have amounted to $102,331.92 plus interest of $18,574.13.

At the time of this writing, some 720 bills have been submitted to the Missouri Legislature. Close to 100 have some health connotation. In addition to the daily personal care which you give your patients, your dedication in medicine also requires that you work for the best health regulations for all the citizens of Missouri. If you feel motivated to help in this effort, contact your District Councilor, the MSMA executive office or Dr. John I. Matthews, head of the MSMA Legislative Committee in Jefferson City.

See you in St. Louis on March 29.

Woman's Auxiliary

The "FOUR Rs" and the Communications GAP

In dealing with that well-known organizational problem of the "communications gap," our Woman's Auxiliary learned the importance of establishing priorities. In trying to learn to establish priorities, we realized that our best tools are the "Three Rs plus one. . . . reading, 'riting, 'rithmetic and rhetoric (verbal communication)."*

The first three "Rs" are our old reliables and have served us well. However, "rhetoric" has become increasingly important and effective in enabling us to increase our understanding and knowledge of problems concerning health care and organized medicine and, also, in helping us to accomplish our own projects and goals in their behalf. We appreciate the opportunities we have to attend the MSMA Council meetings and the MSMA Public Affairs Conference (Feb. 3-4, Jefferson City) as well as numerous other MSMA, AMA and other state and national health care-related meetings. Thank you for the rhetoric. It all has helped to bridge our communications gap.

Mrs. Keith D. Jones
President

More Examples!

Many of our Auxiliary members will attend the Second AMA National Congress on the Quality of Life on March 7-9 at the Palmer House in Chicago. At this Congress, we will study life in the middle years (ages 25-65), a subject vital to all of our families and communities. In fact, we have been asked by the AMA Auxiliary Health Education Chairman to assist in promoting this program by alerting other organizations in Missouri.

I will take special pride in attending the AMPAC meeting in Washington because we are almost certain that our MSMA Auxiliary has attained one of the greatest increases this year in women's memberships in AMPAC and MMPAC. We hope to do even better in 1973, so why not send your $99 for your sustaining membership now or, better still, add an additional $15 and make it a family membership. Remember that your wife's county auxiliary will receive the credit.

And, speaking of rhetoric, it has been a special pleasure for me to attend some of the MSMA Councilor District meetings. In areas that do not have an organized auxiliary, I have had an opportunity to personally meet and invite the doctors' wives to join our MSMA Auxiliary as members-at-large.

Attention, Physicians' Wives!

At the organizational meeting of the Missouri Uterine Cancer Task Force chaired by Dr. MacDonald Bonebrake, Springfield, on January 7 in Jefferson City, it was suggested that an excellent start toward accomplishment of the Task Force goals would be for every physician's wife to obtain her annual Pap Test. In addition to protecting her own life, think of the impact her example will set for every other woman in the state to follow.

---

* **This last "R" also has to do with another letter of the alphabet, the five "Ts": telephone, telegraph, television, telestar and, best of all, "tell a woman."**

EDITORIAL

HEALTH CARE, A RIGHT?

At the recent M.D. Day program at the University of Missouri, Columbia, School of Medicine, a very excellent scientific program was presented in the two-day seminar. However, two discussants spent valuable time in talking about the health care delivery system and how it is going to have to change and be modified to meet the growing health care demands of our population. One of these discussants was the Dean of the Case Western Reserve University School of Medicine, and the other was the Executive Vice-President of Johns Hopkins Hospital, both M.D.'s. Each started his remarks with the statement, "Now that health care is a right of citizenship." Each man then went on to describe the dilemma in which medical educators, doctors, hospital administrators and others in the health care field find themselves in trying to provide for this new "right." One of these gentlemen literally threw upon his hands and could see very little light at the end of the health care tunnel because of maldistribution of health care personnel, increasing costs of health care, insufficient manpower, the maintenance of quality in the light of increased demands by the population, care of the indigent, etc. The other doctor would solve all our problems by herding our doctors and citizens into giant health maintenance organizations with primary care being given by para-medical personnel and by using assembly line automated approaches. Not once did either man question the original premise that has created the mess in the health care field—that health care is a right of citizenship.

Since pre-Medicare days, and perhaps long before that, ambitious politicians, social reformers and labor union leaders have injected the concept that health care is a right of citizenship into the thinking of the average American citizen.

If one ponders this development, even momentarily, he has to be amazed that this declaration of health care is a right—which is of such momentous importance to each American citizen—has not been vigorously debated by our country's philosophers, judicial experts, leaders of medicine and our watchful journalists.

This concept became national policy by fiat.

A "right" merely defines a freedom of action—free speech, peaceable assembly, press, etc. The only right that a government can guarantee, then, is that of freedom of action in those areas outlined by our constitution.

Health care is a service, provided by doctors and others functioning in a free society, to people who wish to purchase it. Providing such a service, then, is the means the health care provider has of earning a living—and it is his means of supporting his life.

If health care could conceivably be considered the "right" of the patient, that "right" should and would be properly protected by governmental law. Since the ultimate authority of law is the force of arms, it logically follows that it is under this threat that the doctor's professional judgment and his ability to earn a living is being coerced. Sound far fetched? Then consider Quebec in 1970 when Canadian physicians, objecting to a new Medicare law were forced to continue working under penalty of jail sentence, and fines up to $500 per day while away from their practices; and for those who spoke out publicly against the bill, a jail sentence of up to one year and a fine of $50,000 per day were imposed.

A government of free people does not have the prerogative to proclaim a "right" for one group of citizens (the patients) if the provision of that "right" usurps and destroys the freedom of another group (the doctor and health care providers).

If the "right" to health care belongs to the citizen, he starts owning the service of the health care provider, without the necessity of earning them or receiving them as a gift from the only man who has the right to give them, the provider himself. Consider the behavior of some of the board of Mid-America Comprehensive Health Planning Agency in this light, with the preponderance of its consumer members.

It is simply remarkable that the medical profession in the United States has never really "called" our government on this absurdity—that medical care is a "right" of citizenship. We quietly acquiesce and allow ourselves to be led down the road of civil servitude without even a muttering. It is long past due that those of us in the medical profession being to speak out with loud clear voices, to tell it like it is, to resist at every point the daily incursions into our professional lives by government; and time, too, that our medical leaders begin to employ the same incisive logic in their efforts to deal with the dilemma of health care that they might to a perplexing clinical problem—that is—get at the cause (declaration of health care as a "right" of citizensip) instead of flailing aimlessly at the symptoms.

LETTERS to the Editor

Joseph V. Finnegan, M.D., Editor
Missouri Medicine
515 East High St.
Jefferson City, Mo. 65101

Dear Doctor Finnegan:

While the discussion of the "Suicidal Patient" by Drs. Sletten and Evenson in the November, 1972 issue was excellent, certain problems in the management of the severe depressive should be amplified, with the suicidal risk ever in mind.

1. The various antidepressive drugs simply have not been as effective in the severely depressed suicidal patients as some enthusiasts in the literature would have us believe.

2. The authors state, "If one is unable to have someone with the patient during this period, the next best thing is to place the patient in a locked ward." The Psychiatric Unit at the St. Louis University Hospital has no locked doors, and depressed patients have been treated in this setting with no problem, and, to my knowledge no suicides, over ten years of operation. I, personally, have not used a locked ward to treat a suicidal or depressed patient for many years and see no reason to change this procedure. The authors themselves note that suicides can occur in locked rooms, and the overall impact of hospitalization is such that adequate therapeutic atmosphere can be obtained without locked doors.

3. I saw no mention in the article of electroconvulsive therapy, which can be lifesaving and interrupt a tortuous form of life for the severely depressed patient. Such patients frequently do not benefit from psychotherapy or the usual antidepressive drugs while in the acute severe stage of their depression, and I feel the patient is done an injustice when electroconvulsive therapy is not suggested or withheld. While, as the authors indicate, we can challenge concepts of hopelessness and despair in suicidal patients, there are many such patients who will not do well in a reasonable period of time unless we as physicians do something for them. Hospitalization and/or electroconvulsive therapy may be lifesaving.

Sincerely,
Jack R. Eidelman, M.D.

County Society News

FIRST DISTRICT

COUNCILOR
JOHN N. MARTIN, M.D., ST. JOSEPH

Buchanan County Medical Society

The 71st annual meeting of the Buchanan County Medical Society was held at the St. Joseph Country Club on Dec. 6, 1972. The event included a dinner dance and installation of officers.

Dr. Lawrence H. Pifer, President for the past year, presided and served as installing officer. New officers who were installed were Drs. Elza F. Butler, President; Randal W. Weed, President-Elect; William B. O'Connor, Vice-President; G. Tyson Carpenter, Secretary; and Robert W. Kieber, Treasurer. Doctor Kieber is serving his 20th consecutive year in this office.

Dr. Richard L. Maginn was named to the Board of Censors. Delegates to the Missouri State Medical Association are Drs. John T. Rogers and Ernest E. Wadlow. Alternate Delegates are Drs. R. Philip Acuff, William B. Rost and Donald J. Stallard. Dr. Edmund W. Kline is serving on the Committee on Public Policy, Dr. Richard O. Craig is on the Board of Trustees and Doctor Pifer is on the Executive Secretary Committee.

After the dinner and installation, the Bowman Trio provided music for dancing.

G. Tyson Carpenter, M.D., *Secretary*

Grand River Medical Society

Fifty members, Auxiliary members and guests attended the annual Christmas Dinner Party of the Grand River Medical Society at the Strand Hotel in Chillicothe on Dec. 14, 1972.

Guests present were Dr. John N. Martin, St. Joseph, First District Councilor, and Mrs. Martin; Mr. Ray McIntyre, Jefferson City, Executive Secretary of the Missouri State Medical Association, and Mrs. McIntyre; and Mr. Royal O. Cooper, Jefferson City, Assistant Executive Secretary of the MSMA.

Dr. Walter T. Gunn, President of the Missouri State Medical Association, was unable to attend the dinner because of weather conditions.

Following brief, interesting and informative speeches by Doctor Martin, Mr. McIntyre and Mr. Cooper, the evening was devoted to dancing, visiting and associated activities.

Music was provided by the "Tempos." Mrs. B. D. Howell, Mrs. John R. Dixon, Mrs. Ralph W. Bohnsack and Mrs. Robert W. Smith of Brookfield were responsible for the fine decorations and door prizes. Mrs. Albert D. Cross, Trenton, spoke briefly on behalf of the Auxiliary.

Dr. Donald Dowell, Chillicothe, presented the President's Plaque to Dr. Joseph Conrad of Chillicothe, retiring President.

Frank R. Daley, M.D., *Secretary*

SECOND DISTRICT

COUNCILOR
LYSLE M. BACH, HANNIBAL

Chariton-Macon-Monroe-Randolph County Medical Society

The regular meeting of the Chariton-Macon-Monroe-Randolph County Medical Society was held on Dec. 14, 1972 at Woodland Hospital Medical Library in Moberly. President F. L. Harms presided.

(*Left to right*) Dr. George Mandler and President Erroll W. Allen of Chillicothe welcome First District Councilor John N. Martin to the Grand River Medical Society's annual Christmas Party.—Dr. Albert D. Cross of Trenton.—As retiring President of the Society, Dr. Joseph Conrad, Chillicothe, accepts the President's Plaque from Dr. Donald Dowell, Chillicothe.

Dr. L. E. Huber arranged the program which was presented by Bartley R. Frueh, M.D., who is in the private practice of ophthalmology in Columbia and assistant professor of ophthalmology, University of Missouri Medical Center. Doctor Frueh discussed "The Management of Ocular Trauma" and "Plastic and Reconstructive Surgery" associated with the eye, lids and orbit. He illustrated his remarks with color slides showing many examples of injuries, congenital defects and tumors and the results after surgery. He also showed pictures of results he has obtained with plastic surgery performed for cosmetic reasons.

Members present were Drs. F. L. Harms, Chariton County; James E. Campbell and D. E. Eggleston, Macon County; F. A. Barnett, Monroe County; W. D. Chute, C. C. Cohrs, P. V. Dreyer, J. Will Fleming, T. S. Fleming, L. E. Huber, G. R. Hudson and Robert H. Young, Randolph County.

Guests were Dr. Frank Emmert, resident in ophthalmology at the University Medical Center in Columbia and Charles Fleming, son of Dr. J. Will Fleming, Jr.

W. D. Chute, M.D., *Secretary*

Seminar on Lifesaving Measures for the Critically Injured

On March 26-29, St. Louis will be the site of the first of 16 seminars on *Lifesaving Measures for the Critically Injured* sponsored by the Trauma Program of the American College of Surgeons. The St. Louis Seminar at the Chase-Park Plaza Hotel will be provided by the Department of Surgery, Washington University, under the directorship of Dr. Walter F. Ballinger, Professor and Chairman; Dr. Carl E. Lischer; and Dr. John Collins.

The curriculum content of the seminar will be designed particularly for rural and general practitioners and emergency department physicians, groups who are called upon to render primary medical care to the overwhelming majority of the seriously injured. The seminar also will be attractive as continuing education for surgeons, including those surgical specialists who treat life-threatening injuries. Specialists in internal medicine who often become involved in the care of the injured also are expected to be attracted by the broad curriculum.

Discussions of assessment of the critically injured and the causes of death soon after injury (airway and respiratory problems, hemorrhagic shock and brain damage) and their prompt treatment will take place at the beginning of the programs. Thereafter, injuries of the head, chest, abdomen and extremities, which are immediately or may become life or limb-endangering, and their management will be covered in detail. Finally, the programs will include life-threatening late complications of severe trauma, such as pulmonary insufficiency from non-thoracic trauma, impaired kidney function complicating patient management and complications following blood transfusions. Hyperalimentation, and intensive care of the trauma patient also will be included.

The Seminars are approved by the AMA for credit toward the Physicians' Recognition Award and by the American College of Emergency Physicians for Continuing Educational Requirements for its members.

Further information about the seminar and an advance registration form may be obtained on request from Trauma Division, American College of Surgeons, 55 East Erie St., Chicago, Ill. 60611, or from Dr. Carl Lischer, Department of Surgery, Washington University, 4960 Audubon Ave., St. Louis, Mo. 63110. The registration fee of $50 includes three lunches and a copy of the new manual of the ACS Committee on Trauma, "Early Care of the Injured Patient."

Eight additional seminars are scheduled for 1973 and seven more for 1974. Each group will be in cities dispersed across the United States. After the St. Louis seminar, the next in the midwest will be provided by Wayne State University in Detroit on May 9-12, 1973.

The seminars are supported by Contract Number NIH 72-4393, the U. S. Public Health Service, Department HEW.

Scientific Sessions Important to Every Physician!

115th MSMA ANNUAL SESSION

March 29-April 1, 1973 St. Louis Chase-Park Plaza Hotel

A name
worth repeating

PANWARFIN®
sodium warfarin

2 mg. 2½ mg. 5 mg. 7½ mg. 10 mg. 25 mg.

In the glaucoma patient on cerebral or peripheral vasodilator therapy
no treatment conflict reported

VASODILAN®
(ISOXSUPRINE HCl)
the compatible vasodilator

- no reported increase of intraocular pressure
- conflicts have not been reported with miotics, corticosteroids, antihypertensives, hypoglycemics or diuretics

In fact, there are no known contraindications in recommended oral doses other than it should not be gi in the presence of frank arterial bleeding or immediate postpartum.

INDICATIONS: Based on a review of this drug by the National Academy of Sciences–National Research Council and/or other information, the FDA has classified the indications as follows:
Possibly Effective:

1. For the relief of symptoms associated with cerebral vascular insufficiency.
2. In peripheral vascular disease of arteriosclerosis obliterans, thromboangiitis obliterans (Buerger's disease) and Raynaud's disease.
3. Threatened abortion.

Final classification of the less-than-effective indications requires further investigation.

COMPOSITION: Vasodilan tablets, isoxsuprine HCl, 10 mg. and 20 mg.

DOSAGE AND ADMINISTRATION: 10 to 20 mg. three or four times d.

CONTRAINDICATIONS AND CAUTIONS: There are no known contraindications to oral use when administered in recommended doses. Should not be given immediately postpartum or in the presence of arteria bleeding.

ADVERSE REACTIONS: On rare occasions, oral administration of the has been associated in time with the occurrence of severe rash. When ra appears, the drug should be discontinued. Occasional overdosage effects such as transient palpitation or dizziness are usually controlled by reducing the dos

SUPPLIED:
Tablets, 10 mg.—bottles of 100, 1000, 5000 and Unit Dose
20 mg.—bottles of 100, 500 and Unit Dose

Integument!

Our skin—the human integument—covers us, defines us, protects us. But skin is subject to cuts, burns, abrasions. And infections. Neosporin Ointment fights infection by providing broad antibacterial action against susceptible skin invaders. It contains antibiotics that are rarely used systemically, reducing the risk of sensitization.

INDICATIONS: *Therapeutically*, used as an adjunct to appropriate systemic therapy for topical infections, primary or secondary, due to susceptible organisms, as in: • infected burns, skin grafts, surgical incisions, otitis externa • primary pyodermas (impetigo, ecthyma, sycosis vulgaris, paronychia) • secondarily infected dermatoses (eczema, herpes, and seborrheic dermatitis) • traumatic lesions, inflamed or suppurating as a result of bacterial infection.

Prophylactically, the ointment may be used to prevent bacterial contamination in burns, skin grafts, incisions, and other clean lesions. For abrasions, minor cuts and wounds accidentally incurred, its use may prevent the development of infection and permit wound healing.

CONTRAINDICATIONS: Not for use in the external ear canal if the eardrum is perforated. This product is contraindicated in those individuals who have shown hypersensitivity to any of the components.

PRECAUTION: As with other antibiotic preparations, prolonged use may result in overgrowth of nonsusceptible organisms and/or fungi. Appropriate measures should be taken if this occurs. Articles in the current medical literature indicate an increase in the prevalence of persons allergic to neomycin. The possibility of such a reaction should be borne in mind.

Complete literature available on request from Professional Services Dept. PML.

NEOSPORIN® Ointment

(POLYMYXIN B-BACITRACIN-NEOMYCIN)

Each gram contains: Aerosporin® brand Polymyxin B Sulfate 5,000 units; zinc bacitracin 400 units; neomycin sulfate 5 mg. (equivalent to 3.5 mg. neomycin base); special white petrolatum q.s. In tubes of 1 oz. and ½ oz. and 1/32 oz. (approx.) foil packets.

Antivert®
(meclizine HCl)
for vertigo*

ntivert® (meclizine HCl) has been found
seful in the management of vertigo associ-
ted with diseases affecting the vestibular sys-
em. It is available as Antivert (12.5 mg.
eclizine HCl) and Antivert/25 (25 mg.
eclizine HCl) scored tablets for conven-
ence and flexibility of dosage. Antivert/25
25 mg. meclizine HCl) Chewable Tablets
re available for the management of nausea,
omiting, and dizziness associated with mo-
ion sickness.

*INDICATIONS. Based on a review of this drug by the National Academy of Sciences-National Research Council and/or other information, FDA has classified the indications as follows:

Effective: Management of nausea and vomiting and dizziness associated with motion sickness.

Possibly Effective: Management of vertigo associated with diseases affecting the vestibular system.

Final classification of the less than effective indications requires further investigation.

CONTRAINDICATIONS. Administration of Antivert during pregnancy or to women who may become pregnant is contraindicated in view of the teratogenic effect of the drug in rats.

The administration of meclizine to pregnant rats during the 12th-15th day of gestation has produced cleft palate in the offspring. Limited studies using doses of over 100 mg./kg./day in rabbits and 10 mg./kg./day in pigs and monkeys did not show cleft palate. Congeners of meclizine have caused cleft palate in species other than the rat.

Meclizine HCl is contraindicated in individuals who have shown a previous hypersensitivity to it.

WARNINGS. Since drowsiness may, on occasion, occur with use of this drug, patients should be warned of this possibility and cautioned against driving a car or operating dangerous machinery.

Usage in Children: Clinical studies establishing safety and effectiveness in children have not been done; therefore, usage is not recommended in the pediatric age group.

Usage in Pregnancy: See "Contraindications."

ADVERSE REACTIONS. Drowsiness, dry mouth and, on rare occasions, blurred vision have been reported.

New Members

Kenneth J. Arnold, M.D., 4989 Barnes Hospital Plaza, St. Louis has become a member of St. Louis Medical Society. Dr. Arnold is a native of Belleville, Ill., received his preliminary education at the University of Notre Dame and his M.D. degree at Washington University in 1968. He specializes in general surgery.

Wlliam Kirkland Bowman, M.D., 14 Doctor's Park, Cape Girardeau, has become a member of Cape Girardeau County Medical Society. Dr. Bowman is a native of Memphis, Tenn., received his preliminary education at the University of Tennessee and Memphis State University and his M.D. degree at the University of Tennessee in 1960. He specializes in internal medicine and cardiology.

Robert E. Burdge, M.D., 1310 S. Grand, St. Louis, has become a member of St. Louis Medical Society. Dr. Burdge is a native of Boston, Mass., received his preliminary education at Stonehill College and his M.D. degree at St. Louis University in 1966. He specializes in orthopedic surgery.

Galileu Cabral, M.D., 3015 N. Ballas Rd., St. Louis, has become a member of St. Louis County Medical Society. Dr. Cabral is a native of Minas, Brazil, received his preliminary education at Colegio Cristo Redentor and his M.D. degree at the University of Juiz de Fora in 1964. He specializes in internal medicine.

Gabrielle A. Carlson, M.D., 7900 Natural Bridge, St. Louis, has become a member of St. Louis Medical Society. Dr. Carlson is a native of Newton, Mass., received her preliminary education at Wellesley College and her M.D. degree at Cornell University in 1968. She specializes in psychiatry.

Suresh Chand, M.D., 1420 Grattan, St. Louis, has become a member of St. Louis Medical Society. Dr. Chand is a native of Hyderabad, India, received his preliminary education at Nizam College and his M.D. degree at Osmania Medical College in 1963. He specializes in child psychiatry.

Ajit Kumar Choudhuri, M.D., 1420 Grattan, St. Louis, has become a member of St. Louis County Medical Society. Dr. Choudhuri is a native of Cuttack, India, received his preliminary education at St. Xavier's College and his M.D. degree at Milratan Sakuar Medical College in 1958. He specializes in psychiatry.

Forest H. Coulson, M.D., 19 Doctors Park, Cape Girardeau, has become a member of Cape Girardeau County Medical Society. Dr. Coulson is a native of Ottumwa, Ia., received his preliminary education at the University of Iowa and his M.D. degree at the University of Iowa in 1940. He specializes in internal medicine.

Rama G. Eachempati, M.D., 1515 Lafayette, St. Louis, has become a member of St. Louis Medical Society. Dr. Eachempati is a native of India, received his preliminary education at Guntur, A-P. India and his M.D. degree at Andhra Medical College in 1957. He specializes in internal medicine, nuclear medicine, endocrinology.

Donald E. Edwards, M.D., 937 Broadway, Cape Girardeau, has become a member of Cape Girardeau County Medical Society. Dr. Edwards is a native of Aledo, Ill., received his preliminary education at the University of Illinois and his M.D. degree at St. Louis University in 1962. He specializes in internal medicine.

Bang Orn Giraparnont, M.D., 601 S. Brentwood, Clayton, has become a member of St. Louis Medical Society. Dr. Giraparnont is a native of Thailand, received his preliminary education at Chulalonghorn Pre-Medical School and his M.D. degree at Chulalonghorn Hospital Medical School in 1966. He specializes in obstetrics-gynecology.

Mary Louise Gray, M.D., 1325 S. Grand, St. Louis, has become a member of St. Louis Med-

ical Society. Dr. Gray is a native of Wilkes-Barre, Penn., received her preliminary education at Barnard College and her M.D. degree at State University of New York in 1952. She specializes in obstetrics-gynecology.

Roger L. Greenlaw, M.D., 307 E. Jefferson, Clinton, has become a member of Henry County Medical Society. Dr. Greenlaw is a native of Indianola, Ia., received his preliminary education at the University of Missouri-Columbia and his M.D. degree at the University of Missouri in 1970. He specializes in family practice.

John G. Gregory, M.D., 1325 S. Grand, St. Louis, has become a member of St. Louis Medical Society. Dr. Gregory is a native of Philadelphia, Pa., received his preliminary education at St. Andrew's School and his M.D. degree at Columbia University in 1965. He specializes in urology.

Duncan A. Killen, M.D., 510 Medical Plaza, 4320 Wornall Rd., Kansas City, has become a member of Jackson County Medical Society. Dr. Killen is a native of Green Hill, Ala., received his preliminary education at Vanderbilt University and his M.D. degree at Vanderbilt University in 1955. He specializes in thoracic surgery.

Virginia L. Larsen, M.D., 5800 Arsenal, St. Louis, has become a member of St. Louis Medical Society. Dr. Larsen is a native of Chungking, China, received her preliminary education at the University of Washington and her M.D. degree at Women's Medical College of Pennsylvania in 1939. She specializes in medical administration.

Thomas B. McKeel, M.D., 180 Doctors Building East, Kansas City, has become a member of Jackson County Medical Society. Dr. McKeel is a native of Pine Bluff, Ark., received his preliminary education at Fisk University and his M.D. degree at the University of Arkansas in 1969. He specializes in internal medicine.

Alexander G. Mallouk, M.D., Wornall Rd. at 44th, Kansas City, has become a member of Jackson County Medical Society. Dr. Mallouk is a native of Cairo, Egypt, received his preliminary education at Cairo University and his M.D. degree at Cairo University in 1960. He specializes in internal medicine.

C. Douglas Meadows, M.D., 777 S. New Ballas Rd., St. Louis, has become a member of St. Louis County Medical Society. Dr. Meadows is a native of Shelby, Mont., received his preliminary education at Beloit College and his M.D. degree at Northwestern University in 1965. He specializes in industrial medicine.

R. William Morris, M.D., 6420 Clayton Rd., St. Louis, has become a member of St. Louis Medical Society. Dr. Morris is a native of St. Louis, received his preliminary education at Harvard College and his M.D. degree at St. Louis University in 1972. He specializes in internal medicine.

Pichat Pojanasomboon, M.D., 1318 Truman, Rolla, has become a member of St. Louis Medical Society. Dr. Pojanasomboon is a native of Bangkok, Thailand, received his preliminary education at Suankularb School and his M.D. degree at the Faculty of Medical Science, Bangkok in 1966. He specializes in ophthalmology.

Carl F. Ritter, M.D., 937 Broadway, Cape Girardeau, has become a member of Cape Girardeau County Medical Society. Dr. Ritter is a native of Cape Girardeau, received his preliminary education at Washington University and his M.D. degree at Washington University in 1966. He specializes in general radiology.

Hugh John Roddy, M.D., 601 S. Brentwood, St. Louis, has become a member of St. Louis County Medical Society. Dr. Roddy is a native of St. Louis, received his preliminary education at Washington University and his M.D. degree at the University of Missouri in 1971. He specializes in general practice.

Daniel L. Schlozman, M.D., 7301 Mission Rd., Shawnee Mission, Kan., has become a member of Jackson County Medical Society. Dr. Schlozman is a native of Kansas City, received his preliminary education at the University of Michigan and his M.D. degree at the University of Kansas in 1964. He specializes in internal medicine (pulmonary diseases).

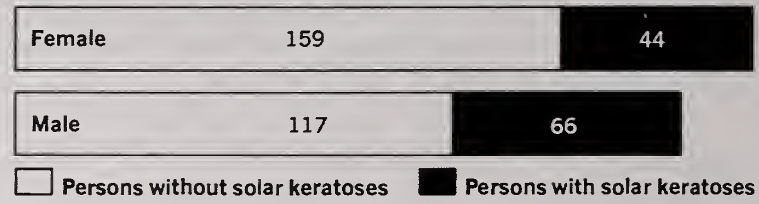
What it means to live and work i Tipton County, Tennessee

Persons who are white and over 40 have one chance in four of having solar keratoses... which may be premalignant

An epidemiologic study* conducted in Tipton County, Tennessee, revealed that 28.5% of white persons over 40 had solar keratoses; most had multiple lesions. Cluster sampling projected an estimated prevalence of 32.5% for white males and 19.5% for white females.

Though this is an unusually high percentage of affected persons, these lesions can occur in any white population, wherever people work or play out of doors.

Prevalence of solar keratoses in white persons over 40 in Tipton County, Tennessee



*Data on file, Hoffmann-La Roche Inc., Nutley, New Jersey.

olar, actinic, senile keratoses

ılled by many names, the typical lesion is flat slightly elevated, brownish or reddish in lor, papular, dry, adherent, rough, sharply fined; usually multiple lesions, chiefly on posed portions of the skin.

equence/selectivity of response

ythema in areas of lesions may begin after veral days of therapy; height of reaction nly in affected areas)* usually occurs within o weeks, declining after discontinuation of erapy. Since this response is so predictable, sions that do not respond should be biopsied rule out the presence of a frank neoplasm.

osmetic results

osmetic results are highly favorable. Incince of scarring is low—important with multie facial lesions. Efudex should be applied ith care near the eyes, nose and mouth.

% cream–a Roche exclusive

nly Roche formulates the 5% cream... gh in patient acceptability... high in clinical ficacy, especially for lesions of hands and rearms... economical.

Before prescribing, please consult complete product information, a summary of which follows:
Indications: Multiple actinic or solar keratoses.
Contraindications: Patients with known hypersensitivity to any of its components.
Warnings: If occlusive dressing used, may increase inflammatory reactions in adjacent normal skin. Avoid prolonged exposure to ultraviolet rays. Safe use in pregnancy not established.
Precautions: If applied with fingers, wash hands immediately. Apply with care near eyes, nose and mouth. Lesions failing to respond or recurring should be biopsied.
Adverse Reactions: Local—pain, pruritus, hyperpigmentation and burning at application site most frequent; also dermatitis, scarring, soreness and tenderness. Also reported—insomnia, stomatitis, suppuration, scaling, swelling, irritability, medicinal taste, photosensitivity, lacrimation, leukocytosis, thrombocytopenia, toxic granulation and eosinophilia.
Dosage and Administration: Apply sufficient quantity to cover lesion twice daily with nonmetal applicator or suitable glove. Usual duration of therapy is 2 to 4 weeks.
How Supplied: Solution, 10-ml drop dispensers—containing 2% or 5% fluorouracil on a weight/weight basis, compounded with propylene glycol, tris(hydroxymethyl)aminomethane, hydroxypropyl cellulose, parabens (methyl and propyl) and disodium edetate.
Cream, 25-Gm tubes—containing 5% fluorouracil in a vanishing cream base consisting of white petrolatum, stearyl alcohol, propylene glycol, polysorbate 60 and parabens (methyl and propyl).

The Council Reports

(Continued from page 80)

MSMA Staff did an outstanding job and the program was well organized. He recommended that the MSMA continue to sponsor such tours.

District #7—Dr. Chandler reported that Jackson County will hold its President's Dinner on Friday, January 19 and invited all those present to attend.

Dr. Chandler stated that in reference to the program to be aired by NBC on "What Price Health?," the Executive Secretary of Jackson County has been in contact with the station that carries the NBC network to determine whether or not the officers of the Society can call a preview of this program. If this is possible, further inquiry will be made as to whether we can give a backup program to answer this. He suggested that other societies might attempt this and indicated that physicians cannot always sit back and be attacked.

Dr. Chandler said that there is an increasing interest in autonomous blood transfusions in Kansas City. A Committee on Blood has been expanded and Dr. Chandler indicated that he would like to report back to the Council on this subject so that perhaps, it can be placed in one of the committees on the state level.

Dr. Chandler stated that they are having difficulties with the Mid-American CHP Agency, particularly as physician representation on the board is concerned. Heretofore, they have had input from the Jackson County Medical Society. This has been changed, but they do not know how or why. There is no M.D. input from the County Society at the present time. The physician now on the board comes back and tries to give a logical explanation of their activities, but he is overwhelmed by so much paperwork. It is difficult to know exactly what is going on.

He said that the Western Missouri Health Education Center, which was reported by Dr. Noback at the last Council Meeting as receiving funding, is gaining momentum. This will be an increasingly important area in the future.

He had spoken previously about the HMO which is to be in Kansas City. The man who contacted Jackson County Medical Society regarding the HMO is now in full residence. He has contacted the unions, large industries, etc. and is getting some interested audiences, so we feel that there will be, in fact, an HMO of some type in Kansas City in the near future.

District #8—Dr. McAlhany reported that Dr. Hoffman, President of AMA, was given an honorary degree from Drury College during his visit in Springfield in November. Dr. McAlhany thanked the officers and councilors who were able to spend time with Dr. Hoffman. He stated that he was very impressed with him.

Greene County did elect a physician as coroner as was anticipated and plans are underway to establish a medical examiner system in Greene County. Clay County has agreed with this concept and a bill will be introduced in the Missouri Legislature. Senators Paul Bradshaw and William Waters are co-sponsoring this bill.

Dr. McAlhany said that there has been advertising by chiropractors in the local newspaper. He was advised first to go through the State Chiropractic Board to see if this group would take action to stop this advertising and then, if necessary, to approach the local Prosecuting Attorney. It was suggested that as the Eighth District Councilor, Dr. McAlhany write a letter to the Chiropractic Board filing a complaint and send a copy of the letter with a copy of the article to the MSMA office and to the local Prosecuting Attorney. A Councilor, a physician or an individual could file a complaint with the Chiropractic Board. Dr. McAlhany will pursue this matter and will report further to the Council.

Dr. McAlhany called on Mr. Schnedler who commented on the Doctor-for-a-Day Program. This project is being undertaken by the Missouri Academy of Family Physicians. The Academy would provide a physician each day the Legislature is in session. It is hoped this will aid in communications between the medical profession and the Legislature.

He also stated that they had won the case with IRS regarding the Greene County Medical Society Foundation. However, the judgment was appealed. It is still in litigation and the Foundation's attorneys have now filed the report and their answer to the appeal. Hopefully, some decision will be made in the near future.

The Greene County Medical Society Business Bureau has now been incorporated and the Board of Directors has been appointed. The Bureau hopes to be in business by Jan. 1, 1973.

After about six months of research, Greene County Medical Society has produced a reference handbook for physicians. A copy was sent to all physicians in Greene County.

District #3—Dr. Franklin stated that he also attended the meeting in Greene County during Dr. Hoffman's visit. He said that functions were well attended, the food was delicious and "Greene County is really on the ball."

At the invitation of Dr. Hetlage, he attended the meeting of the Fourth District. There were other meetings that night, so it was not as well attended as it might have been. At that meeting, he made a suggestion to Dr. Hetlage and the group similar to Dr. Cope's suggestion, that their suggestions be put into the form of resolutions and presented to the House of Delegates.

The installation of Dr. Donald Judd as President of the St. Louis Medical Society will be held on Saturday, January 13 and all are invited. Dr. Richard Bradley is President-Elect, Dr. Joseph Vacca is Vice-President and Dr. Carol Williams is Secretary.

Dr. Franklin indicated that the yellow pages of the phone book in St. Louis are beginning to list doctors under specialties. He asked for comments about this.

Mr. Allen Smith reported that Jackson County started this specialty listing under the AMA trademark years ago. About 12 years ago, the plan was expanded to include three other medical societies in the Kansas City area—Wyandotte, Johnson and Clay Counties.

Dr. Franklin indicated he did not feel this helped the patients, who have always been able to call the St. Louis Medical Society and this has worked very well.

District #2—Dr. Bach—No report.

District #1—Dr. Martin reported that Sister's Hospital in St. Joseph had recently announced that it will close. He indicated that this would mean a loss of 200 beds. Dr. Martin also indicated that Sister's Hospital recently had taken over the ambulance service for St. Joseph. He stated that another hospital in St. Joseph had recently hired a physician for its emergency room.

Dr. Martin indicated that it has been difficult to get new doctors in his area. He stated that he was questioned by some city councilmen as to why they don't get new doctors.

Dr. Martin said that they had coroners in his area who are M.D.'s and that he is willing to help those in other areas if they wish to get M.D. Coroners.

District #6—Dr. Bradshaw indicated that in the absence of Dr. Domke, he would report on the Division of Health. One recent concern was whether or not smallpox vaccination should be continued. The U. S. Public Health Service has gone on record as favoring the discontinuance of required vaccination. The Division of Health had appointed a committee to study this and that committee reported that smallpox vaccination need not be continued. Dr. Bradshaw stated that the Board of Health thinks that it should be continued, but he indicated that the Board would abide by the committee's statement. He also indicated that we were going to be faced with the A-2 English strain of influenza.

Dr. Bradshaw referred to a point mentioned by Dr. Hetlage regarding labeling of prescriptions. In his area, the prescription blanks were printed so that a physician could indicate whether a prescription should be labeled.

Dr. Bradshaw had the privilege of attending the Fall Conference of the MSMA Woman's Auxiliary in Columbia. The two topics presented were legislative and health education. The program was well done and he felt that Mrs. Jones is to be congratulated.

Dr. Bradshaw requested that an ad hoc committee of not only Council members but, also, of those attending the Council meetings be appointed to study the feasibility of inserting a year of continuing training, either after internship or in lieu of internship, in primary patient care in the state of Missouri. This is being studied in several other states.

Dr. Gunn asked whether or not this would include emergency room service. Dr. Bradshaw indicated that he wasn't sure at this point about emergency room service and would rather not go into detail at this time.

It was moved that an ad hoc committee of the Council plus those normally attending the Council meetings be appointed to study the feasibility of inserting a year of continuing training in primary patient care in the state of Missouri. The motion was seconded and carried. Dr. Cope stated that the committee would be appointed on Sunday morning.

Dr. Bradshaw reported that the PTA, in conjunction with the Missouri Department of Education, is planning workshops over the state. The basic premise of these workshops is the study of communicable diseases with emphasis on venereal disease, but the program is not geared entirely to VD control, but also to the development of curriculum from kindergarten through high school and college for health education and communicable diseases.

District #5—Dr. Cope stated that his Councilor District meeting was held in conjunction with the Fall Conference of the Woman's Auxiliary in Columbia and that it had been very successful.

REPORTS OF AMA DELEGATES

Dr. Washburn stated that in the absence of Dr. Neilson, he would give the AMA Delegates' report. The 1972 Clinical session of the AMA was held in Cincinnati on Nov. 26-29, 1972. Approximately 50 reports and 70 resolutions were considered. A hearing of the Council on Long Range Planning and Development was held on November 27 and the Council on Medical Service held a conference on Saturday afternoon, November 25, on the subject of PSRO's (Professional Standards Review Organizations). This problem dominated the meeting. President Nixon, by signing HR 1, made sweeping changes in Social Security, Medicare and Medicaid. The price tag is $6 billion and tax increases are to be imposed. The bill (1) extends Medicare to some people under 65 and brings the disabled into the program; (2) it federalizes aid to the aged, blind and disabled with a guaranteed income program; (3) it increases several Social Security benefits, such as raising widows benefits, and it lifts the amount retirees can earn and retain benefits. Nearly 100 changes are made in Medicare, Medicaid and Maternal and Child Health areas of the law and authorizes payment under Medicare to prepaid group practices termed HMO's.

However, the most significant change in the law for practicing physicians in our nation is the creation of a nationwide system of Professional Standards Review Organizations to police the cost and quality of health care for Medicare and Medicaid. However, extending this principle to the entire population a section at a time is entirely possible. The principle of government control of the practice of medicine through imposition of government-developed standards of diagnosis and treatment has already been established by the enactment of this legislation to create a network of PSRO organizations. It seems that justification for coercing M.D.'s into conforming to federal standards in their practices is that the government has "the right" to control anything it subsidizes.

The AMA Board of Trustees apparently is trying to sell HEW officials on the idea of letting physicians lead the way in the development of guidelines and criteria to be used in PSRO activities.

Dr. Washburn reported that the AMA Council and Committee structure has been drastically altered to save $840,000. Report A, presented by the Board of Trustees, is a sweeping change. It is labeled, "Fiscal Restraint and Priorities." It abolishes four councils and six committees, combines two other councils, reduces membership on the remaining councils and committees, cuts down on frequency of their meetings and trims 15 employees from the headquarters staff.

An AMA Conference on 1973 Membership Program was held on November 27. Membership in the AMA as of October, 1972, stands at 155,074—about 1,000 less than the 1971 total. It is expected that membership will probably equal the 1971 figure by the end of this year. Membership is still far below the 165,000 figure of 1970. Twenty-one states have equalled or bettered their 1971 membership totals. Missouri has reached 98% of its 1971 total. The AMA is issuing "guidelines for a 1973 Membership Drive," which, hopefully, will help component societies bolster local and state society and AMA membership.

The AMA delegates discussed various resolutions and reports presented at the 1972 Clinical Session, which include the following: A resolution encouraging unified membership; Resolution #33 which calls for liaison between state medical associations and federal representatives and agencies; Resolution #1 which calls for physician representation on governing boards of hospitals; Resolution #23 which calls for the development of improved communications between medical staffs and state and local medical societies; Report F of the Board of Trustees regarding the responsibility for actions of the physician's assistant; Report H of the Board of Trustees regarding recommended definition of the role of a primary care physician; Report B of the Council on Medical Service regarding public involvement in health services review; Resolution #24—Review Committees for Medical Practices; Report J of the Council on Medical Service regarding the claims practices of Aetna Life and Casualty Company.

Dr. Benoit stated that he had been asked to discuss the PSRO legislation recently adopted by Congress. Dr. Benoit indicated that a Conference was held during the AMA Clinical Session to discuss PSRO. He indicated that the AMA is going to appoint an advisory committee on PSRO to act as the medical profession's advocate to insure the proper implementation of this program in order to assure the best interests of the public and the profession. This committee will include members from the Board of Trustees, the Council on Medical Service and representatives from other appropriate organizations. The Committee was given several responsibilities which include some of the following:

(1) Provide input from the medical profession into the development of the rules and regulations which will govern the Professional Standards Review Organizations program; (2) Assist state medical associations, or state medical associations in concert with county medical societies, in developing PSRO's and to recommend structures and operating mechanisms; (3) Recognize appropriate geographical boundaries for PSRO's; (4) Distribute information about Public Law 92-603. Dr. Benoit stated that this information needs to be circularized to every member of our Association. He indicated that doctors need to know what is in the law. This Committee and other AMA councils and committees will monitor the effect of PSRO activity on the quality of medical care and report their findings to each future meeting of the House of Delegates.

Dr. Benoit stated that we in Missouri have recognized that we were going down the road toward legislation of this type and that is why we started the Health Care Foundation. He indicated that the HCF is structured along lines that, hopefully, would make it the PSRO for Missouri and, thereby, maintain as much control as possible over our own destiny and over the destiny of the care of patients. Dr. Benoit indicated that the law states there will be no liability to persons serving in a peer review capacity for actions they take unless there is proven malice.

Dr. Benoit then asked if there were any questions. Dr. Bradshaw asked if there would be lay input into the PSRO. Dr. Benoit indicated that as far as judgment of the competency of professional care is concerned, there is no one who can do this appropriately except physicians; but when you are talking about review of health care services, there is other expertise that can be brought to bear on this problem. He indicated that some of these people will be hospital administrators, legislators, legal and business people. Dr. Benoit indicated that the funding of this program has been written into the law. He stated that this legislation should be summarized and published in the Journal.

It was moved that staff publish a summarization of PSRO legislation in a future issue of Missouri Medicine. The motion was seconded and carried.

Dr. Washburn thanked the Alternate Delegates, Dr. and Mrs. Gunn, Dr. and Mrs. Stricker, Dr. and Mrs. Cope and staff for their assistance at the AMA meeting.

HEALTH CARE FOUNDATION REPORT

Dr. Benoit stated that a Board meeting had been held the evening before the Council Meeting. He indicated that the Foundation is proceeding with efforts to obtain financial support from RMP. Dr. Benoit reported that the Foundation had solicited the participating members for support and that they had a reasonably good response. To date, they have received $12,110 from the participating members. He indicated that the Missouri Radiological Society had been extremely active and interested in the Foundation. The Society had held a meeting in Kansas City regarding its role as it relates to peer review and had sent a check to the Foundation.

Dr. Benoit reported that he had recently met with the medical directors of several large companies in Kansas City and the Foundation has agreed to assist them with their problems. One of the companies made a financial contribution to the Foundation recently and Dr. Benoit stated that he feels that the Foundation will obtain similar contributions from the other companies.

Dr. Benoit stated that he would like to commend Mark Halvorson for the fine job he is doing.

Dr. Benoit indicated that the Council had appointed a committee to act as consultants to the Bylaws Committee of the Foundation. However, since the passage of the PSRO legislation, the committee had regrouped. He stated that the Board had spent time discussing how to approach bylaw changes in order to accommodate the Foundation to HR 1. He indicated that one of the main changes would be the manner in which men are elected or appointed to committees. He stated that it was important that these changes be made as soon as possible so that the Foundation might be considered by HEW as the PSRO for Missouri.

Dr. Benoit stated that they had 60% participation from the members of the Association, but would like to have 80%. He indicated that further solicitations will be made.

AD HOC COMMITTEE ON THIRD PARTY PAYMENTS

Dr. Peterson reported that the Committee had met with representatives of carriers and had discussed mutual problems with them. Dr. Peterson mentioned a letter that Aetna is sending to patients and said that at the January meeting of the Commission on Medical Economics, Aetna officials will be present to discuss this and other claims policies.

The Committee presented the following recommendations for consideration by the Council:

1. That standard HIC forms be used to file insurance claims and that this form will have provision for designating any disability and if the carrier requires special forms to be filed, the physician should charge the carrier $5.00 for the preparation of each required form and further that all carriers be so advised.
2. That representatives of carriers present request the Health Insurance Council, in cooperation with the AMA Council on Medical Service, to design simplified, one-sided forms that will enable physicians to retain a copy for their files. This form should also provide a blank for the stamp of the physician's name and ID number.
3. That all carriers adopt the AMA-CPT Third Edition Code.

Dr. Miller moved that this report be accepted and that the recommended actions in the report be taken. Motion was seconded and carried.

AD HOC COMMITTEE ON NEGOTIATION OF PROFESSIONAL FEES

Dr. Peterson distributed copies of proposed bylaws for a negotiation of professional fees organization that the committee is presently trying to organize.

Motion was made and seconded that action on these proposed bylaws be tabled. Motion carried.

Dr. Peterson introduced Mr. Max Lilley, an attorney from Springfield, who had drawn up the proposed bylaws.

REPORT OF THE COMMITTEE ON EMERGENCY MEDICAL CARE

Dr. Klippel stated that a Task Force on emergency Medical Care under CHP had been appointed by Governor Hearnes. The Task Force spent a great deal of time going over this problem and has developed an emergency care services plan for Missouri. He indicated that the Governor's Advisory Council on CHP had approved this program. He stated that every hospital and physician has a role to play in emergency medical care. He indicated that the Governor's Advisory Council on CHP will try to generate support for legislation to implement this program.

Dr. Klippel then spoke briefly about the high cost of using helicopters as ambulances. He asked the Council to pass a resolution endorsing the idea of the development of a program for emergency care in the state.

Dr. McAlhany indicated that he would like to have material to read and study before taking any action on this. Dr. Klippel stated that he was not asking for the endorsement of a specific program, but only of the idea of establishing such a program. It was brought out that a bill had been introduced in the legislature last session regarding ambulances and ambulance personnel, but was not passed. Dr. McAlhany asked what would happen to the small community who could not meet the requirements of this program. Dr. Klippel stated that the idea is to have something down on paper and have money available to implement the program so that the small community that desires these services can avail itself of them.

Dr. Hetlage moved that the Council of the MSMA approve in principle the efforts of the Committee on Emergency Medical Service and encourage further development of a coordinated program for these services in Missouri and, also, provide for the regionalization of ambulances. Motion was seconded and carried.

REPORT OF THE WOMAN'S AUXILIARY

Mrs. Jones thanked the Council and the committee of the Council that helped the Auxiliary with its Fall Conference. She reported that there were 30 state representatives present and the total attendance was between 150 and 200. She stated that the Missouri Auxiliary is the first to have a Health Education Day and that this Auxiliary Health Education Day will be used as a pilot program for the other 49 state auxiliaries.

Mrs. Jones stated that Dr. Richard Bowles had asked the Auxiliary to support the Public Affairs Conference. She indicated that the Auxiliary will support it by attending the Conference and, also, that it would hold a mid-winter Board meeting preceding the Conference. She reported that the Woman's Auxiliary has 91 MMPAC members and that she hoped to have 100 by the end of the year.

Mrs. Jones reported that this year, the Auxiliary has raised $1,000 for the Missouri State Medical Foundation. She said that the county auxiliary with the largest per capita contribution to the Foundation will receive a plaque with that county auxiliary's name inscribed upon it.

Mrs. Jones stated that it was her pleasure to attend the Councilor District meetings and she is interested in attending those in which county auxiliaries have not been organized.

Mrs. Jones requested permission for herself or a representative appointed by her to attend the MSMA Commission and Committee meetings. She indicated that this is a common practice in surrounding states.

The above request was discussed, and it was the general feeling that this matter should be discussed further by the Auxiliary.

REPORT OF THE AD HOC COMMITTEE ON CONTINUING MEDICAL EDUCATION

Dr. Paul Young reported that the AMA Third National Conference of State Medical Association Representatives on Continuing Medical Education was held in October. The main subjects covered during this Conference were (1) Accreditation CME, (2) Curriculum for continuing medical education, (3) Peer Review and (4) Choice between voluntary or compulsory CME. He indicated that the AMA wants to delegate to state chapters the responsibility for CME accreditation. Dr. Young reported that curriculum for CME was discussed a great deal. He indicated that he would like to have some input from the new UMKC School of Medicine in regard to curriculum.

Dr. Young reported that in regard to peer review, Missouri has moved on the road farther than most other states. Our plan in Phase 2 considers it an important approach to have our continuing education program linked to peer review.

Dr. Young stated that various things had been tried in some states in regard to the choice between voluntary or compulsory continuing medical education.

Dr. Young reported that a workshop for members of his ad hoc committee, as well as representatives from the Councilor Districts, is being planned for February 2-3 and will be held in conjunction with the Public Affairs Conference. He asked for Council approval to proceed with this. The subject of a budget for this workshop was mentioned and Dr. Young said that a maximum budget of $500 or less should be sufficient.

Discussion followed on some of the points mentioned by Dr. Young. He suggested to the Council that a long look be taken at ways in which to develop an effective continuing medical education program and that he be given permission to proceed to develop a long range budget for a continuing education program. He indicated that in California, each member was assessed $10 a year for this program. He stated that changes in the budget of the State Medical Association might need to be made.

Motion was made to instruct Dr. Young to proceed with a workshop in conjunction with the Public Affairs Conference. Motion was seconded and carried.

Motion was made and seconded that Dr. Young be given permission to develop for consideration a long range budget for a continuing education program. Motion carried.

Dr. Young reported that the Committee had discussed acupuncture. He indicated that the committee discussed the MSMA news release and the similar policy statement of the State Board of Registration for the Healing Arts to the effect that acupuncture is the practice of medicine. It was noted that the AMA and the Federal Government are conducting research on acupuncture.

Dr. Young read the following statement regarding acupuncture developed by the Committee:

"The application of acupuncture as a modality to relieve human suffering is clearly an issue which physicians in the state of Missouri, the nation and the world must recognize. It would appear that where it is now being used, it is used on a purely empirical basis.

However, if we ascribe to the principles of allopathy, then we must consider its possible benefits to our patients.

"As with any empirical modality of treatment, great caution must be exercised in its use. Therefore, we recommend that acupuncture be considered as an experimental technique. Those physicians who wish to conduct experiments involving acupuncture should be guided by the same ethical and scientific principles which are applied to all experimentation in medicine. It is recommended that experimentation be carried out under the direct supervision of professionals who are well-trained in the basic sciences upon which the modern practice of medicine is based. It is recommended that physicians approach the issue of acupuncture with the same sense of critical inquiry which has characterized the medical profession since Hippocrates."

The motion was made and seconded to accept the statement on acupuncture. During discussion, the following amendment to the statement was presented:

> ". . . that anyone doing acupuncture confer with the AMA Section on Anesthesia for their experimental protocol and to follow this protocol and report their results."

Motion was made by Dr. Hetlage and seconded to table action on this statement and proposed amendment. Motion carried.

The next portion of Dr. Young's report was concerned with the employment of medical students in physicians' offices for the summer months. The Committee presented the following two points in regard to this subject: (1) Suggest to the MSMA Council that Dr. Young be authorized to represent MSMA in negotiations with the other three sponsors of the SAMA Summer MECO Program and (2) the same four sponsors would then assume the responsibility for possible implementation of the program in the summer of 1974. Dr. Young also indicated that guidelines to implement this program would be set up.

Motion was made and seconded to give Dr. Young the authority to represent MSMA in the implementation of this program. Motion carried.

Dr. Young next reported on EKG computer interpretation. He stated that the members of the committee felt that they did not have the appropriate expertise to deal with this problem and, therefore, recommended that a study group be formed including a cardiologist, a general physician and two or more internists and, also, include Dr. Ben McAllister and Dr. Russell Sandberg. Dr. Cope stated that it was his opinion that if Dr. Young wished to appoint a subcommittee to study this problem he would be perfectly in order.

The last item in Dr. Young's report was a letter from Dr. Maxwell Berry requesting CME core curriculum. Dr. Young pointed out that this letter had been directed to the Council for action.

Motion was made and seconded to refer this letter to the Ad Hoc Committee on Continuing Medical Education. Motion carried.

Dr. Franklin moved that Dr. Young's report be accepted. Motion was seconded and carried.

REPORT OF INSURANCE ADVISORY STUDY COMMITTEE

Mr. Fox reported that the Council had directed the formation of this committee and that a meeting had been held recently. He stated that representatives from insurance companies were invited to the meeting. After discussion, they recommended that the three MSMA existing programs (disability, major medical and accidental death and dismemberment) be continued as they are now written. Mr. Fox indicated that the committee had studied some new programs (term life, overhead, excess major medical). The committee recommended that these programs be studied further. It was pointed out that the AMA and the large metropolitan medical societies have their own insurance programs.

Dr. Hansbrough moved acceptance of this report. Motion was seconded and carried.

Dr. McAlhany suggested that, possibly, this committee could investigate some type of deductible insurance program. Dr. Bradshaw pointed out that the law regarding Workmen's Compensation had recently been changed so that anyone who has one or more employees will come under this program. He stated that this is a real hardship on those who employ professional people. It was suggested that this committee investigate insurance coverage under various insurance companies.

Motion was made to look into other health coverage plans other than the Blues and consider statewide coverage for MSMA membership. Motion was seconded and carried.

Dr. Cope referred this resolution to the Advisory Study Committee for report.

Dr. Bradshaw suggested that the staff find out what they can about the new Workmen's Compensation Law and report back to the Council. Dr. Cope directed that staff check into this and report back to the Council.

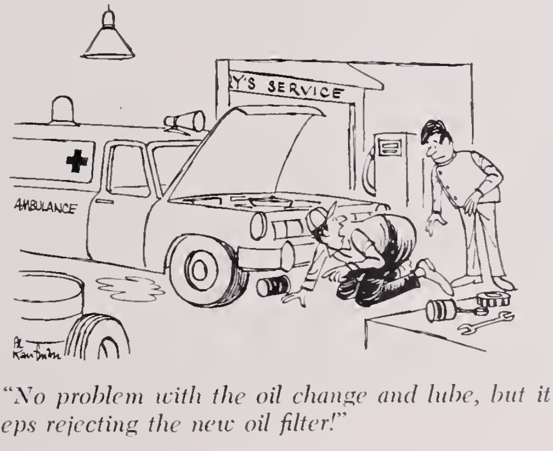
Dr. Thoma stated that St. Louis University comes under this program. Dr. Thoma indicated that St. Louis University is self-insured. He was directed to bring report on this to the next meeting.

REPORT OF COMMISSION ON MEDICAL-LEGAL AFFAIRS

Mr. Cooper reported that a summary of an excellent film, "Courtroom Confrontation," was shown at a recent meeting. The film is based on the landmark "Darling Case."

There was discussion at a recent meeting of this committee regarding video tape depositions. The Bar Association is going to attempt to have court rules changed to allow video tape depositions in court. It was pointed out that it depended upon the judge as to whether or not these types of depositions would be admitted as evidence.

The Committee suggested that the use of pre-trial screening panels for professional liability suits should be restudied. The Medical Association had studied this in 1970. At that time, it recommended that pre-trial screening panels not be used. A member of each organization



"No problem with the oil change and lube, but it keeps rejecting the new oil filter!"

represented at the joint medical-legal meetings will be appointed to serve on an ad hoc committee to study pre-trial screening panels.

Mr. Cooper stated that at the committee meeting it was brought out that the Buchanan County Bar Association had declined to accept the "Interprofessional Code." Since that time, however, they have changed their stand and accepted the Code.

Mr. Cooper reported that the medical examiner system was discussed and the committee agreed to continue the joint meetings.

Motion was made and seconded to accept this report. Motion carried.

REPORT ON CARIBBEAN TOUR SPONSORED BY MSMA

Mr. Cooper reported that the cruise had been excellent and that the scientific program was very good. He read several letters commending the Association for the cruise and the scientific program.

Dr. Hansbrough moved that this report be accepted with commendation.

Motion was seconded and carried.

PROVOST FOR HEALTH AFFAIRS

Dr. Bradshaw reported that the committee (Drs. Bradshaw, Chandler and Gulick) appointed by Dr. Cope to suggest a recommendation for the position of Provost for Health Affairs would like to make the following motion:

"It is the unanimous opinion of the Committee that in recognition of the service Dr. William D. Mayer has given to the State Medical Association while acting as Dean of the University of Missouri School of Medicine-Columbia, that the Council endorse Dr. Mayer as a candidate for the office of Provost for Health Affairs of the University of Missouri." Motion was duly seconded and carried.

PUBLIC AFFAIRS CONFERENCE

Mr. Swarens reported that the Public Affairs Conference will be held on Feb. 3-4, 1973 at the Ramada Inn in Jefferson City. The Woman's Auxiliary will hold its Board Meeting in conjunction with this Conference. All invited speakers have agreed to appear. Among the speakers will be Sen. Lem T. Jones, Jr., Rep. Richard J. Rabbitt and two AMA officials—one from Washington and one from Chicago. The Commission on Public Affairs would like to ask each Councilor to contact his county society officers and urge them to attend the Public Affairs Conference. Motion was made, seconded and carried to file this report as information.

COMMISSION ON PUBLIC AFFAIRS

Mr. Swarens reported that upon request from the Council, the Commission on Public Affairs investigated the use of mobile X-ray units for chest screening in Missouri. He stated that at the time of the Council request, the Tuberculosis and Respiratory Disease Society of St. Louis and Eastern Missouri was operating under guidelines which permitted mass X-ray screening. However, the Society has recently revised its guidelines to conform with policy statements of HEW, The American College of Radiology and the USPHS, which urge caution concerning the use of photofluorographic X-ray units for chest screening programs. The Society has discontinued mass screening, but will continue to offer its services to problem situations.

The Commission on Public Affairs endorses the new guidelines for mobile X-ray units as issued by the Tuberculosis and Respiratory Diseases Society of St. Louis and Eastern Missouri. Motion was made, seconded and carried to accept the interim report of the Commission on Public Affairs and endorse the guidelines regarding Mobile X-Ray Units as set forth by the Tuberculosis and Respiratory Disease Society of St. Louis and Eastern Missouri.

BOARD OF REGISTRATION FOR THE HEALING ARTS

The Chairman called on Dr. Melvin Kasten, President of the Missouri State Board of Registration for the Healing Arts, to give any comments which he might have. Dr. Kasten called attention to the September Council minutes and spoke on several issues contained therein. He stated that in regard to Dr. Martin's concern about the anesthesiologist from Canada who was licensed in one of the Carolinas, the reason she could not obtain a Missouri license was that her license in Carolina was by reciprocity and not by examination, and Missouri does not have reciprocity with Canada.

Dr. Kasten then spoke on the subject of absenteeism slips being signed by some physicians for people working in industry when, in fact, the individuals were not ill. This is expensive to industry. He stated that many people appear in court and testify against these physicians. These physicians have been warned, but there isn't much the State Board can do.

Dr. Kasten stated that just recently the FLEX examination was given to 195 individuals, of which about 140 were foreign doctors and about 45 were taking the examination for the second time. In June, the FLEX examination was given to 86 foreign graduates with 17 passing. Dr. Kasten indicated that the grading system of FLEX requires 75% on Part I and no grade lower than 60 and 75% on Part II and no grade lower than 60. He stated that the FLEX examination is costing the state money. The law now states that we can charge $25 for those taking Part I and $25 for Part II which is a total of $50. It costs the State Board $65 to give the examination. We hope that we can get this changed in the law.

Following Dr. Kasten's report, Dr. Hetlage brought up two matters of concern. One is the unsupervised use of transactional analysis in groups in which there is no psychiatric supervision. Some are cropping up and do seem to come under the realm of psychiatry.

The other item of concern is that at least in the St. Louis area, many discount houses and department stores have a nurse piercing ears. He indicated that this may or may not come under the jurisdiction of the State Board.

Dr. Kasten indicated that they have checked into the matter of piercing ears, but do not have the manpower or the money to check all of them. He indicated that he thought the Board had written to these stores, but was not certain.

Dr. Kasten stated that someone has brought up the question of whether or not the Board can license the graduates of the University of Missouri in Kansas City under the present law. The law needs to be updated.

Dr. Mayer stated that we have very carefully avoided trying to change the State Registration Law for so long that we are now functioning with one that is definitely outdated. He indicated that all he was suggesting is that when the State Board does open this up for possible changes, that very strong input from the MSMA Council be made as well as strong input from the Medical Schools of this State.

REPORTS OF THE DEANS

In the absence of Dr. Guze of Washington University School of Medicine, who attended the meeting earlier, Dr. Gulick gave a brief report regarding their building and expansion program. Dr. Gulick indicated that they moved into the new Eastern Division about a month ago and are very happy with it. It holds 500 patients. These are replacement beds and not new beds. McMillan Hospital and the old Maternity Hospital are closing. They have approval to build a parking garage underneath a part of Forest Park which will hold 1,300 cars. Children's Hospital has a new addition. They are going to completely renovate Maternity and McMillan Hospitals.

Dr. Gulick reported the part-time faculty has been requesting representation on the Executive Faculty and they have elected one man to serve on the Executive Faculty, that one man being Dr. Gulick.

Dr. Mayer reported that his tardiness on the previous day was due to the fact that the Chancellor called a meeting of all deans of the Columbia campus, elected faculty council and council of the graduate faculty of the Columbia campus because the President was about to release the third draft on the role and scope of the University. He read to the Council the statements contained therein regarding the health professions, stating that in the area of the allied health professions at the University of Missouri at Columbia and Kansas City, they shall continue to expand as funds and facilities permit. Hopefully, this will enable us to move forward. The document further indicated that the University of Missouri at St. Louis needs to look at what it is doing in nursing and health professions. He stated that the two local Columbia papers recently carried much of this on their front pages.

Dr. Mayer stated that at the September meeting of the MSMA Council, he informed the Council that he had recommended a policy change regarding admissions to the University Hospital. No objections were raised by the Council at that time. Dr. Mayer stated he pursued this with the Chancellor, President and Board of Curators and the following policy statement was adopted in October: "Any person requesting medical care, special study or diagnosis may be admitted to the University Hospital. Admission may occur by direct request of a patient, by referral of a licensed psysician or through such other means as deemed appropriate under such rules and regulations as may be adopted."

Dr. Mayer indicated that at the present time, Dr. Noback was being visited regarding accreditation by the Liaison Committee of the Council on Medical Education of AMA and the Association of American Medical Colleges. Because Kansas City is a new school, it has a visitation almost annually. The University of Missouri has this visitation about once every seven years and such visitation had just been completed. It was reported in an informal way to the President, Chancellor and Dr. Mayer that they thought we had a good institution, very possibly on the way to being a great one, and commended us for the "remarkable" progress which has occurred during the last seven years. They indicated very directly that we should be proud of the School of Medicine in Columbia.

Dr. Mayer then commented on the reorganization. In October, the Chancellor received approval to reorganize his office. The Chancellor and Vice-Chancellor constitute the office of the Chancellor. On January 1, 1973 Dr. Walter Daniel, former President of Lincoln University, will assume the responsibility of Vice-Chancellor. Under the Chancellor's office, they have created three provost positions—Provost for Administration, Provost for Academic Affairs and Provost for Health Affairs. The Chancellor sees these five individuals as having the total responsibility for the administration of the Columbia campus and its 22,000-member student body. Dr. Mayer stated that he felt it very significant that they did include health affairs in those five. Under the Provost for Health Affairs will be the Director of the University Hospital, the Dean of the School of Medicine and the Dean of the School of Nursing. Consideration is being given to the establishment of a Dean of the School of Allied Health. If such becomes a reality, this, too, would be under the Provost for Health Affairs.

Dr. Thoma indicated that St. Louis University is engaged in a building program. Its main activity has been in nailing down its affiliation with DePaul Hospital. Affiliation will be a complete one. A medical director has been appointed. They are undergoing a $6 million building program. Affiliation of OB-GYN services has already begun. If all goes well, they anticipate not having an obstetrical service immediately in the University Hospital. It is anticipated in the next decade that Firmin Desloge will be phased out as a secondary care hospital. They are not adding beds, but simply upgrading the ancillary services and putting in better specialized services, such as radiation services, etc. An all-weather bridge is being built to Bethesda Hospital. They intend to use Desloge for tertiary care only. DePaul will have a 500-bed hospital in their final building program. The Kingshighway site will be converted to a community health center. It is hoped that this will be both a University service and a private practice community center.

HCFM PROPOSAL TO MRMP

Chairman Cope called on Mr. Mark Halvorson, Executive Vice-President of the Health Care Foundation of Missouri, to present its proposal to the Missouri Regional Medical Program. Mr. Halvorson pointed out that the HCFM has been negotiating with MRMP regarding the funding activities of the Foundation. These activities have related to a data development project that was preliminary to a proposal for a grant from MRMP which will extend over a three-year period beginning in September, 1973. Council endorsement of this three-year project is being sought.

The nature of the project is to develop appropriate criteria and guidelines for evaluating the quality, accessibility and costs of medical care and defining areas of educational needs within the health care delivery system in Missouri. The title of the project is "Quality Criteria for Medical Care Evaluation." Mr. Halvorson then explained the goals, objectives and methodology of the project, indicating that this project is to continue the development of a Medical Care Evaluation Model. Mr. Halvorson stated that during the past three to six months, the HCFM has been working on a preliminary or experimental project in cooperation with MRMP.

This experimental project was designed to determine if HCFM could develop a data base that would assist in the development of a medical evaluation model. This data base is now in the process of being developed.

Mr. Halvorson reported that the project has been endorsed by MAOPS, Mid-Missouri Areawide Comprehensive Health Planning Agency, State of Missouri Department of Community Affairs, Missouri Hospital Association and numerous other interested medical organizations that have agreed to cooperate on the project if their assistance and cooperation is sought. He stated that Council approval of this project will be sincerely appreciated and endorsement of this project by the Council will be an important factor.

Dr. Bradshaw asked for an approximation of the number of cases that the Foundation has reviewed to date. It was reported that as of August 31, 223 cases had been reviewed and there are currently about 60 cases in process. Of those, some 83% were cases submitted by health insurance carriers and a small percentage by physicians. He stated that this only gives them a start on a data base.

Mr. Halvorson reported that a survey questionnaire was sent to the participating members of HCFM on an experimental basis. He stated that in the future, they can foresee the development of specific surveys, perhaps by specialties, asking more specific questions relative to selected days and patient management of those days. We need and request full physician interest in these surveys so that the focus can be on what educational programs might logically be developed.

Dr. Hansbrough indicated that one physician submitted 51 cases and all were ruled in favor of the physician. He stated that he felt that in terms of volume of cases, each was reviewed separately and should be recorded as 51 individual cases, thus raising the number of cases which the Foundation found in favor of the physician. Mr. Halvorson indicated that in terms of volume, each one was reviewed separately, but in terms of their record keeping, they include him as one massive case. Dr. Hansbrough indicated that he felt these should be recorded as 51 separate cases. Mr. Halvorson stated that of the total cases about 50% are in favor of the physician and about 50% in favor of the carrier.

Discussion followed as to whether or not this project had been approved by the CHP (a) and (b) agencies. Dr. Rikli indicated that he felt they had a favorable report back from the A agency.

Dr. Miller stated that the total number of cases reviewed is quite different from the relatively few physicians involved. He said this also brings to note the big concern of the HCFM in its activities so far, namely, insufficient experience in reviewing cases. He said this is due to a host of reasons.

Dr. Miller called attention again to the fact that PSRO legislation has been passed as of October 27 as part of HR 1. The HCFM has had some foresight in developing a structural organization that will possibly accommodate this and will put us in the forefront in health care activities to accommodate this legislation.

Dr. Miller moved that the Council endorse the project report as submitted by Mr. Halvorson. Motion was seconded and carried.

KIDNEY DISEASE PLAN

Dr. Cope called on Dr. John F. Maher, Professor of Medicine (Nephrology), University of Missouri-Columbia. Dr. Maher indicated that a group of physician-leaders in the field of nephrology have developed a Comprehensive Multi-Regional Kidney Disease Plan for Kansas, Missouri and Southern Illinois, which is now being submitted by the Kansas, Bi-State and Missouri Regional Medical Programs in the form of a project proposal for funding by the Regional Medical Programs Service of HEW. Dr. Maher stated that kidney disease is the fourth leading killer, but the National Kidney Foundation is 19th in contributions. Many times, kidney disease does not come to the attention of physicians at a time when it could be properly treated. He stated that when most of those present graduated, there were only two nephrologists in the country. There must be more postgraduate education for the practicing nephrologists.

Dr. Maher stated that they find that patients who live in the St. Louis area may go to Kansas City or Columbia and patients in Kansas City sometimes go to St. Louis. It is felt this is inefficient, especially when a person needs dialysis three times a week. He also indicated that at times the staff is overworked to a point where there is concern regarding fatigue and at other times, the work load is too low. He stated that a registry and inventory of dialysis facilities and patients in need of therapy will help straighten these things out. He said that in order to transplant, they need to identify those individuals who are compatible and need to find donors where they can.

Dr. Maher stated that they also have a problem of one laboratory identifying the characteristics of an individual. They send the kidney and find that when it gets to the other laboratory, it doesn't work. We want to have all laboratories use a common system for all the potential recipients and have the Kansas City laboratory function as the reference laboratory so that kidneys can be taken from anywhere in this region.

Dr. Maher said that in order for this program to work, they cannot have the transplant surgeon go after the donor. This would mean considerable travel and loss of time. They would like to identify and train organ procurement surgeons in many areas throughout the region.

On motion of Dr. Hetlage, duly seconded, the Council endorsed the project as spelled out by Dr. Maher.

PROJECT REGARDING CLINICAL NURSE ASSOCIATE

Helen Yeager, M.D., Assistant Professor, Department of Pediatrics at the University of Missouri, Columbia, presented to the Council a proposal submitted to the Missouri Regional Medical Program for development of a program to define the role of a clinical nurse associate for neurologically handicapped children. This project is being submitted by the Department of Pediatrics and the Department of Nursing. Dr. Yeager indicated that their interest is to try to determine for what role the nurse can be trained to perform to care for these children. She emphasized that this is not a training proposal, but a planning proposal. She indicated that they are asking for funding for two degree nurses to develop clinical experiences and to evaluate the value of academic courses in preparing the nurse for the role of specialist in the care of neurologically handicapped children. The purpose of this project is to define ways in which a nurse with expanded responsibilities as a Nurse Associate can enrich health programs for neurologically handicapped children. Also, resources open to the nurse for her training in these areas will be explored.

On motion, duly seconded, the Council agreed to endorse this project proposal.

PROGRESS REPORT ON CONSUMER HEALTH INFORMATION PROGRAM

Dr. Rikli, Director of the CHIP Program, indicated that this program had been in the making for approximately three years and that when the proposal was funded, a letter was sent to MSMA bringing this proposal to our attention and that it is getting underway. He stated that copies of this program are available.

Dr. Rikli stated that three areas now have consumer health information centers. These areas are Salem, Warrensburg and the metropolitan area of Kansas City. The center in Salem includes the three-county area of Iron, Reynolds and Dent counties. The specialist in the Salem area is Mr. Jim Bryan. Mr. Bryan is a graduate of a health education course at the University of Missouri. The health information specialist spends about six weeks in preparation and then is sent into the area to get acquainted with the producers of health care services and with consumer groups.

The health information specialist in Warrensburg had been talking to various groups about the program. She was asked about poison control by one of these groups. She contacted the directors of the program and they supplied the necessary information to present to this group on how to control this problem.

Dr. Rikli indicated that the problems in Salem and Warrensburg are quite different than those in Kansas City. He stated that a nurse was selected to be the CHIP representative in Kansas City. He indicated that the main problem in Kansas City is helping people identify where they can get help with their health care problems. He stated that sensitive issues are being placed upon these people in these communities. He indicated that in one of the areas, there had been questions about the propriety of a physician operating a pharmacy and dispensing drugs from his office. He indicated that he felt that we need to recognize that these representatives are going to be faced with sensitive issues and hopefully, these can be brought to the attention of the appropriate organization for their consideration. He stated that the role of these CHIP representatives was not to give solutions to problems, but to obtain information for the parties involved and to help resolve their controversies.

During discussion, a question was asked as to whether or not Dr. Rikli felt that this program in any way conflicts with local and state health departments. Dr. Rikli stated that he felt that these programs complement each other and doesn't believe that they are competitive. Dr. Rikli indicated that the CHP "A" agency had expressed support for the program.

Motion was made and seconded that Dr. Rikli's report be filed. Motion carried.

Dr. Cope appointed the following to a committee to study the feasibility of inserting a year of continuing training in primary patient care in the state of Missouri: Dr. Bradshaw, Chairman; Drs. Noback, Gunn and Hansbrough.

REPORT OF THE BUILDING COMMITTEE

Dr. Matthews reported that a survey had been done and we now have clear title to the property. Title insurance has been purchased. The property has been purchased and we have taken possession of it. He stated that the architect had completed the drawings and we are ready to go ahead with the remodeling. He indicated that the building committee would like authorization to proceed with borrowing money to do the remodeling.

Dr. Matthews stated that costs of remodeling and furnishings will be somewhere in the neighborhood of $110,000.

Dr. Cope, as a member of the building committee, made a motion regarding the committee's request for authorization to borrow money for remodeling. Dr. Chandler, Vice-Chairman, took over chairmanship of the Council Meeting.

Dr. Cope moved that the Building Committee be empowered to negotiate, in its best judgment, a loan in the amount of $100,000-$110,000 for the purpose of remodeling and furnishing the property located at 113 Madison Street, Jefferson City, for use as the office of the MSMA and that the officers of the Association be authorized to sign the necessary instruments and papers to obtain the loan. Motion was seconded and carried.

REPORT OF THE COMMITTEE ON LEGISLATIVE AFFAIRS

Dr. Matthews stated that the committee had discussed numerous items and, generally, the items discussed were bills that have been pre-filed, most of which had been acted upon previously by the Council or the House. The immunity from liability for peer review physicians bill is in the works. A medical examiner system bill was introduced and calls for a pilot medical examiner system on an area-wide basis rather than on a statewide basis. The cost of a statewide system had prevented acceptance in previous sessions.

Another bill would allow embalmers to enucleate corneas. This would allow properly trained embalmers to enucleate corneas for transplants.

A proposed bill from the ophthalmologists providing for delegation of authority was discussed. This bill came about as a result of the Curteman decision. This bill would allow technicians to perform certain functions that had been delegated to them by a physician. The Committee and Council will support the delegation of authority bill.

Dr. Matthews stated that the committee had discussed the possibility of getting a sick doctor statute passed in next two or three years. The Committee would like Council approval to proceed with the planning of a sick doctor statute.

Motion was made and seconded that the legislative committee start developing sick doctor legislation. Motion carried.

AMA REPORT

Mr. Mortenson reported that an AMA membership project will be underway shortly in St. Louis City and St. Louis County. He stated that Missouri's AMA membership had dropped from last year. He urged everyone who can to attend a "National Leadership Conference" being conducted by the AMA in February.

Mr. Mortenson reported that Mr. David Weihaupt of the AMA will be coming to Missouri two or three times in the next few months to speak to groups about the AMA.

Mr. Mortenson indicated that Dr. Hoffman appreciated the hospitality extended to him during a recent visit to Springfield. Mr. Mortenson stated that all comments he had heard about the trip had been very favorable.

He stated that the legislative efforts of the AMA are going to be shifted more toward state legislation.

REPORT OF THE PLANNING COMMITTEE

In the absence of Dr. Kerr, Chairman, Dr. Cope, a member of the Planning Committee, gave the committee's report. Dr. Chandler, Vice-Chairman of the Council, took over the chairmanship of the Council Meeting.

The Committee feels that it needs direction regarding what its duties are. The Committee does not know if it is an action committee or just a committee to make suggestions.

The first item discussed by the committee was Resolution #27, "Council Chairmanship." This resolution had been re-referred by the Council to the Committee at the September Council meeting for reconsideration and a report before the Annual Meeting. The Committee tabled this resolution.

The next item discussed by the Committee was the possibility of a merger between St. Louis City and St. Louis County societies. The Committee felt that the Council should be aware of this possibility and, perhaps, develop ideas as to how this can be handled.

The third item discussed by the Committee was that the Committee is of the opinion that strict adherence to tradition constitutes a continuing deterrent to the sustained involvement of competent and interested members of the Association. The Committee recommends to the Council that an appropriate study be made of this problem.

Dr. Cope reported that the Committee recognizes the continuing problem of communications and suggests that the Communications Committee: (1) Advocate the use of short, personal letters from Councilors to members of their Districts; (2) Maintain closer liaison with hospital staffs. He indicated that, possibly, a key man could be appointed on each hospital staff to receive and disseminate communications from the Association.

The Committee discussed the status of the Immediate Past-President. It was pointed out that the Immediate Past-President is neither an officer nor a councilor and requests that legal counsel furnish clarification of the Council status of the Immediate Past-President.

The Committee suggests that the Health Care Foundation study the possibility of developing a certified hospital admission program.

The last item discussed by the committee was income-producing programs for the Association. Dr. Cope stated that the Association will have to have more money in future years and that there is a limit as to how much dues can be raised to finance the Association. The Committee recommended that the Council study the feasibility of retaining competent management consultants to recommend possible income-producing programs for the Association.

Dr. Hetlage stated that he would like to refer to Item #2 in the Committee report. He indicated that if Dr. Franklin agreed, he and Dr. Franklin would submit a statement at the next Council meeting as to what is going on in regard to the merger of St. Louis City and St. Louis County. Dr. Franklin agreed to do this, but stated that he was not sure that they would get anywhere with this.

Dr. Hetlage indicated that relative to Item #3 regarding strict adherence to tradition that delegates from his District would be happy to testify before this committee with their ideas regarding this subject. He stated that this is the logical place to do it and that a representative group would come to explain their ideas.

Dr. Hetlage also made reference to Item #4 regarding communications. He indicated that during his Coun-

MUNNS

St. Louis, Mo.

Topeka — Kansas City — Wichita

cilor District report, it was suggested that the AMA green sheet be sent to a key man on each hospital staff to be placed on the hospital bulletin board in order to aid in communications with hospital staff members.

Following considerable discussion regarding this matter, the following amended motion was presented:

> Move that "the AMA green sheet be sent to a designated member of each hospital staff for posting on the bulletin board—that man being a designate of the Councilor in each District and that such mailing begin on Jan. 1, 1973 until April 1, 1973 and then be reevaluated at the annual meeting before further continuance." Motion was seconded and carried.

Mr. McIntyre requested that each Councilor send the names of his designees in each hospital to the state office before January 1. Motion was made and seconded to accept this report. Motion carried.

Dr. Cope stated that he liked the microphone system used at this meeting and suggested that Staff look into the possibility of getting such a system for the MSMA.

FINANCE COMMITTEE

Dr. Gulick indicated that the Council had given permission to borrow money for the remodeling and furnishing of the new building. He stated that, perhaps, the Council would like to consider the possibility of selling up to $50,000 from our investment account for remodeling and borrow the rest of the amount needed. This would be quite a saving as far as interest on a loan is concerned.

Motion was made and seconded that the Finance Committee be authorized to sell a portion of our reserve securities up to $50,000 for the purpose of financing the remodeling of the new building. Motion carried.

LEGISLATIVE AFFAIRS COMMITTEE

Dr. Matthews stated that the Council needed to take action regarding the removal of smallpox vaccination from the mandatory list of immunizations in Missouri. The Board of Health Committee recommended that this be removed from the mandatory list. The Board of Health does not agree with the Committee, but will not oppose the bill. Dr. Matthews stated that he felt that the MSMA should take the position that it does not oppose the bill, but does feel that the physicians should go ahead and immunize their patients as they see fit. He indicated that the Academy of Pediatrics has endorsed such a bill.

During discussion, it was pointed out that during the last few years, there have been more deaths and complications resulting from vaccination than from the disease itself. Mr. Fox stated that a recent telephone poll of pediatricians indicated that they are divided about 50-50 on whether or not to continue mandatory vaccination.

Motion was made and seconded that MSMA support a non-mandatory smallpox vaccination position with individual physicians continuing to immunize their patients as they see fit. Motion carried.

NEXT COUNCIL MEETING

The next meeting of the Council will be held on Friday, February 2 and Saturday, February 3. The Public Affairs Conference will begin Saturday afternoon and continue until noon Sunday, February 4. The meetings of both the Council and the Public Affairs Conference will be held at the Ramada Inn in Jefferson City.

A joint meeting of the Building Committee and the Finance Committee was called immediately following the adjournment of the Council Meeting.

LEO H. POLLOCK, M.D.

Missouri Medicine in Review

FORTY YEARS AGO

The annual Hodgen Lecture was presented on January 10 at the St. Louis Medical Society Building by Dr. Frank C. Mann, Rochester, Minn.

Dr. M. Pinson Neal, professor of pathology, University of Missouri School of Medicine in Columbia, has been appointed Missouri member of the Council of the Southern Medical Association to fill the unexpired term of Dr. Walter Baumgarten, St. Louis, who resigned.

The Mississippi Valley Dermatological Society met in Kansas City on January 14. Dr. William W. Duke, Kansas City, was the guest.

The St. Louis Urological Society elected the following officers at a meeting on December 16: president, Dr. J. Hoy Sanford; vice-president, Dr. C. E. Burford; secretary-treasurer, Dr. J. F. Patton, all of St. Louis.

Dr. C. Edgar Virden, Kansas City, was elected president of the staff of St. Joseph's Hospital at a meeting of the hospital staff on January 9. Other officers elected were chief-of-staff, Dr. T. J. Beattle; vice-president, Dr. Harry L. Jones; treasurer, Dr. C. S. Capell; and secretary, Dr. Frank B. Wallace.

Dr. Llewellyn Sale, St. Louis, was elected president of the Missouri Social Hygiene Association at the 24th annual meeting of the organization in St. Louis on January 9. He succeeds Rev. Alphonse M. Schwitalla, S.J., dean of the St. Louis University Medical School, who served as president for the past five years.

TWENTY-FIVE YEARS AGO

Dr. Paul R. Hawley, M.D. has been named chief executive officer of the national organization of nonprofit Blue Cross hospital service plans and Blue Shield, formerly known as Associated Medical Care Plans. Doctor Hawley organized and developed the medical hospital program of the Veterans Administration and headed the medical work in the European Theater of Operations during World War II. He will assume his new duties on April 1. He resigned as Chief Medical Director of the Veterans Administration on December 31 and will terminate his services as special assistant to the Administrator of Veterans Affairs and as chairman of the Committee on Unification of the Medical Services of the Armed Forces in late March.

In accepting the appointment, Doctor Hawley said, in part: "Blue Cross and Blue Shield have only one objective—that of offering the best in prepaid health services at the lowest possible costs. These organizations have been operated for the benefit of the patient—not for the benefit of the doctor or the hospital. And, so long as I am in any way connected with these organizations, there will be no deviation from this fixed policy."

James U. Scott, M.D., Harrisonville, was honored recently on his 76th birthday and for the culmination of 53 years of practice in Cass County.—Ira H. Lockwood, M.D., Kansas City, has been appointed one of four directors to serve on the board of the Radiological Society of North America.

TEN YEARS AGO

Forrest C. Long, M.D., began his term as president of the medical staff officers of Methodist Hospital in St. Joseph on January 1. Other newly-elected officers are Drs. John N. Martin, president-elect and Henry C. Willumsen, vice-president. Dr. Warren Baker of Savannah was reelected secretary-treasurer.

New chief-of-staff of Boone County Hospital in Columbia is James E. Bumgarner, M.D. Dr. Ray B. Lewis was elected vice-chief-of-staff and Dr. James C. Denninghoff was elected secretary.

Gov. John Dalton has named Ralph R. Coffey, M.D., Kansas City, a member of the 16th Judicial Commission, which consists of Jackson County.

CLASSIFIED ADS

FOR SALE—Kansas City Area: Excellent clinic building suitable for large volume solo or small group practice. 20 min. to downtown K.C. Financing available. Write to Box 382, Missouri State Medical Association, Box 1028, Jefferson City, Mo. 65101.

OUTSTANDING OPPORTUNITY—Director of Child Psychiatry. Boarded or Board Eligible preferred, but not required. Must be able to obtain Missouri License by examination or reciprocity. Salary: $24,300 or $27,300 depending upon qualifications. (Additional $2,000 per annum if boarded.) Location: Small (Population 12,000) Midwestern town with two outstanding private liberal arts colleges; State University, including department of child psychiatry, 25 miles away; close to one of Midwest's largest lake areas. Combines the best of clean air country living and proximity to cultural, intellectual and recreational opportunities. Contact: Donald B. Peterson, M.D., Fulton State Hospital, Fulton, Mo. 65251, AC 314 642-3311.

MEDICAL DIRECTOR—Model City Comprehensive Health Center. A new facility for providing Medical, Dental, Nursing, Mental Health, Optical, Social, Home Health Care and Family Planning Services plus Physical, Occupational and Speech Therapy. Tremendous challenge and professional potential in a Group Practice complex, with complete medical staff. Experience in Management Administration needed. Salary is open. Send Curriculum Vitae to Project Director, Joint Community Health Services, Inc., 915 Olive Street, Suite 1228, St. Louis, Mo. 63101.

URGENT NEED—For specialists in Pediatrics, OB-GYN, ENT, Orthopedics and General Practice. Opportunities group, Associate and solo practice. Drawing area over 60,000 population. 275 hospital beds. Write President, County Medical Society, Box 311, Hannibal, Mo. 63401.

PHYSICIAN—Sutter Clinic, Inc., St. Louis, Mo., seeks physician for appointment as Associate. Six-man group, specializing in Occupational Medicine and Surgery. Office practice only. Excellent remuneration. All benefits. Regular hours. Call or write Mr. John M. Hackett, Administrator, Sutter Clinic, Inc., 819 Locust St., St. Louis, Mo. 63101 (include curriculum vitae) or call collect—Area Code 312/621-4300.

WANTED—House physician on internal medical service. Monday through Friday, 8 to 5. Applicant must have Missouri license. Remuneration on basis of experience. Contact Dr. L. B. Harrison, 1755 South Grand, St. Louis, Mo. Phone 314-771-0500.

O'FALLON PROFESSIONAL CENTER—O'Fallon, Missouri, offers an opportunity to start a new practice or relocate a stagnant one in the fastest growing area in the fastest growing county in the state, St. Charles County. Forty minutes from downtown St. Louis. New medical building to be completed in May. Over 1600 square feet available. Try it-You'll like it! Call Lawrence Bellon, D.D.S. (314) 272-5777 or (314) 227-7270.

DOCTOR'S PRACTICE—Grossing $65,000-$75,000 per year. Large home, separate apartment, complete office including equipment—entire package, $77,500. For more information, write R. E. Harland, M.D., 118 N. Main St., Ironton, Mo. 63650.

$316,000 PRACTICE—By Board Surgeon and Board Internist, 55 and 53 years old. Both retiring. Excellent opportunity to continue this practice. Good hospital affiliations and completely equipped office in Kansas City, Mo. Write Box 381, Missouri State Medical Association, 515 E. High, Jefferson City, Mo. 65101.

GENERAL PRACTITIONER OR INTERNIST—Willing to do general practice, OB optional. Salary or percentage in Corporation Practice. Financial remuneration negotiable. Town of over 5,000 near Kansas City. Recreational facilities. Minimal night call. Vacation and time for postgraduate course. Open staff JCAH Hospital. Contact C. T. Riley, M.D., P. O. Box 68, Richmond, Mo. 64085. AC 816-776-6945 or 816-776-6069.

WANTED—Physician under 40 years of age interested in joining a group in Occupational Medicine in Kansas City, Mo. Write to Box 377, Missouri State Medical Association, 515 E. High, Jefferson City, Mo. 65101.

OB-GYN and PEDIATRICIAN—To practice with a seven-physician group in a picturesque and historic river town in Northeast Missouri. Excellent hospitals and schools. Salary leading to early partnership. Write Box 376, Missouri State Medical Association, 515 E. High, Jefferson City, Mo. 65101.

SPECIALIST FAMILY PRACTICE—Generalist or surgeon. Town, 4000. 50 miles from Kansas City. Outstanding community. Large trade area. Airfield. Hospital. Radio. Good location for multiple specialty clinic. Brochure gives details. Large practice free. Long established. Retiring. Write Box 379, Missouri State Medical Association, 515 E. High, Jefferson City, Mo. 65101.

RADIOLOGIST—Board eligible, Diagnosis and Nuclear Medicine, 36, married, desires rural solo practice or association in Missouri. Telephone—AC 816-461-5243. Box 380, c/o Missouri State Medical Association, 515 E. High, Jefferson City, Mo. 65101.

EXCELLENT OPPORTUNITY—For board certified or board eligible anesthetist to locate in Kansas City, Mo. Call 816-923-9007 between 7 AM and 3:30 PM. St. Joseph Hospital.

IMMEDIATE CARE PHYSICIAN—No weekends or night call. $25,000 to start. One hour from Kansas City, Mo. Write Medical Director, Thompson, Brumm & Knepper Clinic, 902 Edmond St., St. Joseph, Mo. 64502.

MSMA NEWS ROUND-UP

MISSOURI STATE MEDICAL ASSOCIATION

FEBRUARY, 1973

Legislature opens with landslide of bills

The 77th Missouri General Assembly convened early in January and immediately began hearing legislation that is of direct interest to physicians.

Of the approximately 700 bills introduced to date, close to 70 are of interest to the medical profession and several more will have to be monitored as the Session progresses in case amendments would affect medicine.

Introduction of bills will probably not end until March, so it is possible that more medically-related measures may appear.

Gov. Christopher (Kit) Bond, in his message to the House and Senate, touched on few medical subjects but did request that the lawmakers place Blue Cross-Blue Shield under state regulations.

Key Bills

Some of the key bills already introduced include:

* Senate Bill 62 would relieve physicians and surgeons from liability for actions taken by a medical review, hospital review or other review committee of which they were a member. It stipulates the committee actions must have been taken without malice and after reasonable efforts to establish facts supporting the actions.

* Senate Bill 42 would require pharmacists to place the exact name and dosage of a prescribed drug on every container label, unless otherwise directed by the physician.

* Senate Bill 3 provides for the regulation of Blue Cross-Blue Shield by the Missouri Division of Insurance. Also, House Bills 235 and 256 call for regulation of the Blues.

* Senate Bill 34 would allow a licensed embalmer who has completed a certified course to surgically remove corneas that have been donated by the deceased.

* Senate Bill 95 and House Bill 132 would remove a clause that limits chiropractors to adjusting the spine "by hand."

* Senate Bill 122 calls for the establishment of a county medical examiner system in some first and second class counties. Smaller counties would have the option to adopt the system or remain under the present coroner system.

* House Bills 302 and 342 would remove smallpox from the list of mandatory immunizations required for public school children.

* House Bill 314 provides that nonlicensed technicians could be employed by physicians to perform tests, conduct examinations and render certain treatment under the physician's supervision.

115TH ANNUAL SESSION

Record 27 scientific sessions set for MSMA Conference

A record number of scientific sessions has been scheduled for the 115th Annual Session of the Missouri State Medical Association, March 29 - April 1, in St. Louis.

Twenty-seven scientific sessions, 20 sponsored by interspecialty groups, will highlight the four-day conference.

Delegates' Handbooks, which provide members of the House with essential advance information about issues to be presented at the Annual Session, are now being prepared. By having this information in advance, delegates have an opportunity to give it careful study and discuss issues with their local medical society colleagues.

However, very few resolutions from local medical societies for inclusion in the Handbook have been received at MSMA Headquarters.

Due to the large number of resolutions introduced at the opening session of the House in the past, the House adopted a new policy during the 1972 session which states: "All resolutions to appear in the Handbook must be received at the Association office **45 days prior to the opening session** of the House." That would mean a deadline of Feb. 12.

Any resolutions to be introduced after that time must be made available to the House of Delegates 24 hours before the sessions at which it is to be introduced. At least 200 copies of the resolution or funding for same must be supplied by the individual or society introducing the resolution.

At the **Second Session** of the House, the same procedure would be followed, but such introduction would be allowed only if approved by **two-thirds** of the delegates voting. The same procedure would be followed for the **Third** Session, but it would then take a **unanimous** vote of the House to allow introduction.

Component societies are urged to send in their resolutions to insure they will be included in the Delegates' Handbook. As mentioned, the deadline for resolutions is Feb. 12.

Delegates to vote on two Constitution amendments

Delegates attending the 115th MSMA Annual Session that will be held March 29-April 1, 1973, will vote on two amendments to the Constitution. The first amendment amends Article IX of the Constitution to read as follows:

> **"Petitions signed by 10% of the active members of the Association, including petitioners representing at least one half of the component medical societies, will initiate a referendum regarding changes in the Constitution or Bylaws or questions before the House of Delegates or Council. A majority vote of all active members of the Association responding shall determine the question."**

The other amendment implements Resolution 8 "Representation for Medical Students" and amends Article IV of the Constitution by adding the following sentence thereto:

> **"Included also in the House of Delegates shall be two student delegates, each from a difdent body of each of the medical schools in the State of Missouri, who shall have the same rights and privileges as other delegates."**

If this change in the Constitution concerning the medical student delegates is adopted, a corresponding change will be necessary in the Bylaws. The Constitution and Bylaws Committee has recommended the following amendment to the Bylaws:

> **"Each of the medical schools in the State of Missouri shall be entitled to send each year two student delegates, each from a different class, elected by the student body of the said medical school. The names of such student delegates shall be certified by the Dean of said medical school to the Secretary of this Association thirty days before the Annual Session. Such student delegates shall have all the rights and privileges of all other delegates."**

The Committee on Constitution and Bylaws is presently studying all of these changes and will have other recommendations for the Delegates before the Annual Session.

New Task Force to stress importance of Pap Tests

MacDonald D. Bonebrake, M.D., of Springfield chaired the initial meeting in Jefferson City on Jan. 7 of a newly-formed Task Force to stress the importance of Pap Tests for the early detection of cervical cancer in the women of Missouri.

The task force has a four-year goal of devising ways and means for all women, and primarily those in "high risk groups," to obtain a Pap Test by 1976. The test is applicable to all women over 20 years of age and for younger women at risk.

Composing the Task Force in Missouri, which compliments similar task forces in all other states, are prominent representatives from various disciplines throughout the state, including the Woman's Auxiliary to the M.S.M.A., education representatives, medical societies, etc.

Although spearheaded by the American Cancer Society, Missouri Division, Inc., the Missouri Uterine Cancer Task Force is designed to include the broadest possible spectrum of organizations and individuals concerned with this problem.

Continued from Page 1

Legislature

* Senate Bills 48 and 57 call for licensing and regulation by the state of ambulances, attendants and drivers and their apprentices. The measures also set equipment standards and outline operating requirements.

* Senate Bill 134 is an emergency medical care measure which would utilize Highway Patrol helicopters as emergency vehicles.

* House Bill 173 would change the statute of limitations law regarding physicians. Currently, a malpractice suit must be brought within two years of the act. The new law would extend the limitation to two years from the date of ascertainment.

* An abortion bill was introduced at press time which would include provisions for abortions after the 20th week of pregnancy.

Controlled Substance Regulations

A summary of the Missouri Controlled Substance Regulations were recently mailed to each individual and firm registered under the act by the Bureau of Narcotics and Dangerous Drugs, Missouri Division of Health.

The purpose of the act is to provide more effective controls over narcotic and dangerous drugs in an effort to prevent them from being diverted from their intended medical uses to illicit markets, abuse and misuse and to provide for enforcement of the laws and regulations by state and local authorities.

Physicians, dentists, veterinarians, and other practitioners who administer, prescribe or dispense any of the drugs controlled by this legislation are required to register with the Missouri Division of Health. Registration at the state level is now **required** prior to registration or re-registration with the Federal Bureau of Narcotics and Dangerous Drugs.

Any physician who has not registered should contact the Bureau of Narcotics and Dangerous Drugs, Missouri Division of Health, Broadway State Office Building, Jefferson City, Mo. 65101, and an application form will be sent.

Complete copies of the regulations and statutes as well as additional copies of the summary are available and will be sent upon request.

Hospital Conference scheduled

A second conference for health service providers, "Large and Small Hospital Organization for the '70s," will be held March 1-2 at the Ramada Inn in Columbia.

The Conference was established last year in an effort to improve communication among hospital medical staff, administrators and board members. Any individual concerned with the problems of health services delivery is urged to attend.

Keynote speaker Robert M. Cunningham, Jr., editor and publisher of **Modern Hospital**, will set the conference theme, "public and professional accountability for the quality, accessibility and cost of health care services."

The Missouri State Medical Association has joined with the Missouri Regional Medical Program, Bi-State Regional Medical Program, Missouri Hospital Association and Missouri Association of Osteopathic Physicians and Surgeons in co-sponsoring the Conference.

The program is acceptable for eight elective hours by the Academy of Family Physicians.

Registration, which includes dinner, breakfast and coffee breaks, is $60 for a team of three from one hospital and $25 for each additional participant. Checks should be made payable to Hospital Organizational Conference and mailed to Fred D. Roberts, Missouri Regional Medical Program, Lewis Hall, Columbia, Missouri, 65201. (See Registration Form on preceding page)

For more Conference details, contact the MSMA Headquarters, Box 1028, Jefferson City, Mo., 65101.

Registration for the Conference begins at 11 a.m., Thursday, March 1. Arthur E. Rikli, M.D., coordinator of the Missouri Regional Medical Program, will open the meeting at 1 p.m.

Program highlights include:

Thursday, March 1

1:15 p.m. — **"Public and Professional Accountability for Health Care Services"** — Robert M. Cunningham, Jr., Editor and Publisher, Modern Hospital

2:00 p.m. — **"Legislative Controls and Interventions"** — Charles Jacobs, Attorney, JCAH

3:15 p.m. — **"A Student's Assessment of Health Wants and Needs"** — Samuel W. Cullison, SAMA, University of Missouri-Columbia, School of Medicine

3:30 p.m. — **"Consumer Advocates' Assessments of Health Wants and Needs"** — Mrs. Evelyn Welton, Health Resources Institute; and the Rev. R. W. Beard, Presbyteria of Northeast Missouri

4:00 p.m. — **Panel Discussion** — All previous speakers participating

5:00 p.m. — **Session Ends**

6:30 p.m. — **Dinner**
Presiding, Robert S. Mosser, M.D.
Speaker, E. Grey Dimond, M.D., Provost for Health Services, University of Missouri-Kansas City School of Medicine: **"Relationship of Medical Training Programs to Public and Professional Accountability for Health Care Services"**

Friday, March 2

7:30 a.m. — **Breakfast Workshops**
(Choice of one)
"Problem-Oriented Medical Records" — Edward J. Twin, M.D., Executive Director, Kansas City General Hospital
"Emergency Care" — Allen Klippel, M.D., Director, Emergency Medical Services for St. Louis
"Recruitment of Manpower for Health Services" — Robert S. Mosser, M.D., Professor of Medicine, University of Missouri-Kansas City School of Medicine

9:00 a.m. — **"Certificate-of-Need Legislation"** — Harald Graning, M.D., Director, Health Care Facilities Services, HEW

9:45 a.m. — **"Hospital Cost Containment"** — D. Eugene Sibery, Executive Vice President, Blue Cross Association

11:00 a.m. — **"Peer Review"** — John I. Matthews, M.D., Treasurer, Health Care Foundation of Missouri

11:45 a.m. — **"Granting and Periodically Reviewing Professional Privileges"** — Charles Jacobs, JCAH

12:30 p.m. — **Adjournment**

Come To The Land Of The Vikings

MISSOURI STATE MEDICAL ASSOCIATION

Scandinavian Adventure

Stockholm • Helsinki • Copenhagen

Departing Kansas City and St. Louis

JULY 18, 1973

Spend two fun-filled weeks of carefree discovery in spectacular Sweden, Finland and Denmark. Fly direct to Scandinavia via World Airways private jet.

Our Scandanavian holiday features the finest deluxe hotels in each city . . . delicious international cuisine . . . the ultimate in VIP service . . . plus all the freedom of individual travel at charter savings.

You'll travel in relaxed luxury . . . there's never any regimentation . . . just do as you please. Optional sightseeing tours are available each day. You'll have plenty of time for shopping in world famous department stores or quaint little shops. You'll find it ALL in Scandinavia.

Scandinavian Adventure price is only $868 per person. Space is strictly limited. Complete the reservation form and return it today.

Send to:
Missouri State Medical Association

Librium® and (chlordiazepoxide HCl) concomitant us

Librium (chlordiazepoxide HCl) is used as adjunctive antianxiety therapy concomitantly with certain specific medications of other classes of drugs, such as cardiac glycosides, antihypertensive agents, diuretics, anticholinergics and antacids.

Antianxiety effectiveness: Demonstrated in a broad range of psychologic and physical dysfunctions; indicated when reassurance and counseling are not enough and until, in the phy
judgment, anxiety has been reduced
appropriate levels.

Effect on mental acuity: Usually n
proper maintenance dosage.

Safety: An excellent clinical record. In genera
use, the most common side effects reported have been drowsiness, ataxia and confusion, particularly in the elderly and debilitated.

in relief of clinically significant anxiety

Librium®
(chlordiazepoxide HCl)

5-mg, 10-mg, 25-mg capsules
up to 100 mg daily in severe anxiety

Before prescribing, please consult complete product information, a summary of which follows:
Indications: Relief of anxiety and tension occurring alone or accompanying various disease states.
Contraindications: Patients with known hypersensitivity to the drug.
Warnings: Caution patients about possible combined effects with alcohol and other CNS depressants. As with all CNS-acting drugs, caution patients against hazardous occupations requiring complete mental alertness (*e.g.*, operating machinery, driving). Though physical and psychological dependence have rarely been reported on recommended doses, use caution in administering to addiction-prone individuals or those who might increase dosage; withdrawal symptoms (including convulsions), following discontinuation of the drug and similar to those seen with barbiturates, have been reported. Use of any drug in pregnancy, lactation, or in women of childbearing age requires that its potential benefits be weighed against its possible hazards.
Precautions: In the elderly and debilitated, and in children over six, limit to smallest effective dosage (initially 10 mg or less per day) to preclude ataxia or oversedation, increasing gradually as needed and tolerated. Not recommended in children under six. Though generally not recommended, if combination therapy with other psychotropics seems indicated, carefully consider individual pharmacologic effects, particularly in use of potentiating drugs such as MAO inhibitors and phenothiazines. Observe usual precautions in presence of impaired renal or hepatic function. Paradoxical reactions (*e.g.*, excitement, stimulation and acute rage) have been reported in psychiatric patients and hyperactive aggressive children. Employ usual precautions in treatment of anxiety states with evidence of impending depression; suicidal tendencies may be present and protective measures necessary. Variable effects on blood coagulation have been reported very rarely in patients receiving the drug and oral anticoagulants; causal relationship has not been established clinically.
Adverse Reactions: Drowsiness, ataxia and confusion may occur, especially in the elderly and debilitated. These are rever
ble in most instances by proper dosag
adjustment, but are also occasionally
served at the lower dosage ranges. In a
few instances syncope has been report
Also encountered are isolated instance
skin eruptions, edema, minor menstru
irregularities, nausea and constipation
extrapyramidal symptoms, increased a
decreased libido—all infrequent and
generally controlled with dosage reduction; changes in EEG patterns (low-volt
fast activity) may appear during and af
treatment; blood dyscrasias (includin
agranulocytosis), jaundice and hepati
dysfunction have been reported occasi
ally, making periodic blood counts and
liver function tests advisable during pr
tracted therapy.
Supplied: Librium® capsules containin
5 mg, 10 mg or 25 mg chlordiazepoxi
HCl. Libritabs® tablets containing 5 mg
10 mg or 25 mg chlordiazepoxide.

Everybody experiences psychic tension.

Most people can handle this tension.

Some people develop excessive psychic tension and need your counsel

and a few may need counseling
and the psychotropic action of Valium® (diazepam).

Before deciding to make Valium
zepam) part of your treatment
n, check on whether or not the
ient is presently taking drugs
l, if so, what his response has
n. Along with the medical and
ial history, this information can
p you determine initial dosage,
possibility of side effects and
ultimate prospects of success
ailure.

While Valium can be a most
pful adjunct to your counseling,
hould be prescribed only as long
xcessive psychic tension per-
s and should be discontinued
en you decide it has accom-
shed its therapeutic task. In
eral, when dosage guidelines
followed, Valium is well
erated (see Dosage). For con-
ience it is available in 2-mg, 5-mg
l 10-mg tablets.

Drowsiness, fatigue and ataxia
ve been the most commonly re-
rted side effects.

Until response is determined,
tients receiving Valium should
cautioned against engaging in
zardous occupations requiring
mplete mental alertness, such
driving or operating machinery.

ROCHE
Roche Laboratories
Division of Hoffmann-La Roche Inc.
Nutley, N.J. 07110

Before prescribing, please consult complete product information, a summary of which follows:

Indications: Tension and anxiety states; somatic complaints which are concomitants of emotional factors; psychoneurotic states manifested by tension, anxiety, apprehension, fatigue, depressive symptoms or agitation; symptomatic relief of acute agitation, tremor, delirium tremens and hallucinosis due to acute alcohol withdrawal; adjunctively in skeletal muscle spasm due to reflex spasm to local pathology, spasticity caused by upper motor neuron disorders, athetosis, stiff-man syndrome, convulsive disorders (not for sole therapy).

Contraindicated: Known hypersensitivity to the drug. Children under 6 months of age. Acute narrow angle glaucoma; may be used in patients with open angle glaucoma who are receiving appropriate therapy.

Warnings: Not of value in psychotic patients. Caution against hazardous occupations requiring complete mental alertness. When used adjunctively in convulsive disorders, possibility of increase in frequency and/or severity of grand mal seizures may require increased dosage of standard anticonvulsant medication; abrupt withdrawal may be associated with temporary increase in frequency and/or severity of seizures. Advise against simultaneous ingestion of alcohol and other CNS depressants. Withdrawal symptoms (similar to those with barbiturates and alcohol) have occurred following abrupt discontinuance (convulsions, tremor, abdominal and muscle cramps, vomiting and sweating). Keep addiction-prone individuals under careful surveillance because of their predisposition to habituation and dependence. In pregnancy, lactation or women of childbearing age, weigh potential benefit against possible hazard.

Precautions: If combined with other psychotropics or anticonvulsants, consider carefully pharmacology of agents employed; drugs such as phenothiazines, narcotics, barbiturates, MAO inhibitors and other antidepressants may potentiate its action. Usual precautions indicated in patients severely depressed, or with latent depression, or with suicidal tendencies. Observe usual precautions in impaired renal or hepatic function. Limit dosage to smallest effective amount in elderly and debilitated to preclude ataxia or oversedation.

Side Effects: Drowsiness, confusion, diplopia, hypotension, changes in libido, nausea, fatigue, depression, dysarthria, jaundice, skin rash, ataxia, constipation, headache, incontinence, changes in salivation, slurred speech, tremor, vertigo, urinary retention, blurred vision. Paradoxical reactions such as acute hyperexcited states, anxiety, hallucinations, increased muscle spasticity, insomnia, rage, sleep disturbances, stimulation have been reported; should these occur, discontinue drug. Isolated reports of neutropenia, jaundice; periodic blood counts and liver function tests advisable during long-term therapy.

Dosage: Individualize for maximum beneficial effect. *Adults:* Tension, anxiety and psychoneurotic states, 2 to 10 mg b.i.d. to q.i.d.; alcoholism, 10 mg t.i.d. or q.i.d. in first 24 hours, then 5 mg t.i.d. or q.i.d. as needed; adjunctively in skeletal muscle spasm, 2 to 10 mg t.i.d. or q.i.d.; adjunctively in convulsive disorders, 2 to 10 mg b.i.d. to q.i.d. *Geriatric or debilitated patients:* 2 to 2½ mg, 1 or 2 times daily initially, increasing as needed and tolerated. (See Precautions.) *Children:* 1 to 2½ mg t.i.d. or q.i.d. initially, increasing as needed and tolerated (not for use under 6 months).

Supplied: Valium® (diazepam) Tablets, 2 mg, 5 mg and 10 mg; bottles of 100 and 500. All strengths also available in Tel-E-Dose® packages of 1000.

Valium®
(diazepam)

Information for Contributors

Articles are accepted for publication on condition that they are contributed solely to this journal. Material appearing in Missouri Medicine is protected by copyright. Permission will be granted on request for reproduction in reputable publications provided proper credit is given and author gives permission.

Manuscripts should be typewritten, double spaced, and the original with one carbon copy submitted. Retain another carbon copy for proofreading. Used manuscripts are not returned. School and hospital appointments of the author should accompany the manuscript. It is desirable that a synopsis-abstract of approximately 135 words accompany the manuscript. References should be arranged at the end of the article in the order in which the references are cited in the text. The reference should give name of author, title of article, name of periodical, volume number, initial page number and year. Authors are responsible for reference accuracy.

Illustrations should be glossy prints or drawings in India ink on white paper. They should not be mounted and name of author and figure number should be penciled lightly on the backs. Legends should appear on a separate sheet. Colored illustrations will be used when suitable if author assumes the actual cost.

Legal difficulties may arise from unauthorized use of names, initials or photographs in which individuals can be identified. Permission should be secured from patient or legal guardian and signed duplicate or photostat submitted with such photographs or identification. The Editor and Editorial Board assume no responsibility for the opinions and claims expressed in articles contributed by authors. If citation of an institution related to the article is made, approval of the chief of service should be given in a letter accompanying the article.

Reprint order blanks will accompany proof, which will be sent to authors prior to publication.

All material other than scientific should be received prior to the first of the month preceding month of publication.

Please give notice of change of address at least one month in advance of the change, giving old and new addresses.

acute arthritic inflammation...heat that freezes

In acute rheumatoid arthritis consider Tandearil. The anti-inflammatory action of Tandearil quickly helps reduce heat, pain, swelling, and stiffness. Results are usually seen in 3 or 4 days. Try it for a week when the symptoms defy aspirin control.

Remember that Tandearil is not a simple analgesic. It should not be used on patients responding to routine therapy. Before using, please read the prescribing information. It's summarized below.

Tandearil® helps take the heat off

oxyphenbutazone NF

Geigy

Tablets of 100 mg.
Important Note: This drug is not a simple analgesic. Do not administer casually. Carefully evaluate patients before starting treatment and keep them under close supervision. Obtain a detailed history, and complete physical and laboratory examination (complete hemogram, urinalysis, etc.) before prescribing and at frequent intervals thereafter. Carefully select patients, avoiding those responsive to routine measures, contraindicated patients or those who cannot be observed frequently. Warn patients not to exceed recommended dosage. Short-term relief of severe symptoms with the smallest possible dosage is the goal of therapy. Dosage should be taken with meals or a full glass of milk. Patients should discontinue the drug and report immediately any sign of: fever, sore throat, oral lesions (symptoms of blood dyscrasia); dyspepsia, epigastric pain, symptoms of anemia, black or tarry stools or other evidence of intestinal ulceration or hemorrhage, skin reactions, significant weight gain or edema. A one-week trial period is adequate. Discontinue in the absence of a favorable response. Restrict treatment periods to one week in patients over sixty.
Indications: Acute gouty arthritis, rheumatoid arthritis, rheumatoid spondylitis.
Contraindications: Children 14 years or less; senile patients; history or symptoms of G.I. inflammation or ulceration including severe, recurrent or persistent dyspepsia; history or presence of drug allergy; blood dyscrasias; renal, hepatic or cardiac dysfunction; hypertension; thyroid disease; systemic edema; stomatitis and salivary gland enlargement due to the drug; polymyalgia rheumatica and temporal arteritis; patients receiving other potent chemotherapeutic agents, or long-term anticoagulant therapy.
Warnings: Age, weight, dosage, duration of therapy, existence of concomitant diseases, and concurrent potent chemotherapy effect incidence of toxic reactions. Carefully instruct and observe the individual patient, especially the aging (forty years and over) who have increased susceptibility to the toxicity of the drug. Use lowest effective dosage. Weigh initially unpredictable benefits against potential risk of severe, even fatal, reactions. The disease condition itself is unaltered by the drug. Use with caution in first trimester of pregnancy and in nursing mothers. Drug may appear in cord blood and breast milk. Serious, even fatal, blood dyscrasias, including aplastic anemia, may occur suddenly despite regular hemograms, and may become manifest days or weeks after cessation of drug. Any significant change in total white count, relative decrease in granulocytes, appearance of immature forms, or fall in hematocrit should signal immediate cessation of therapy and complete hematologic investigation. Unexplained bleeding involving CNS, adrenals, and G.I. tract has occurred. The drug may potentiate action of insulin, sulfonylurea, and sulfonamide-type agents. Carefully observe patients taking these agents. Nontoxic and toxic goiters and myxedema have been reported (the drug reduces iodine uptake by the thyroid). Blurred vision can be a significant toxic symptom worthy of a complete ophthalmological examination. Swelling of ankles or face in patients under sixty may be prevented by reducing dosage. If edema occurs in patients over sixty, discontinue drug.
Precautions: The following should be accomplished at regular intervals: Careful detailed history for disease being treated and detection of earliest signs of adverse reactions; complete physical examination including check of patient's weight; complete weekly (especially for the aging) or an every two week blood check; pertinent laboratory studies. Caution patients about participating in activity requiring alertness and coordination, as driving a car, etc. Cases of leukemia have been reported in patients with a history of short- and long-term therapy. The majority of these patients were over forty. Remember that arthritic-type pains can be the presenting symptom of leukemia.
Adverse Reactions: This is a potent drug; its misuse can lead to serious results. Review detailed information before beginning therapy. Ulcerative esophagitis, acute and reactivated gastric and duodenal ulcer with perforation and hemorrhage, ulceration and perforation of large bowel, occult G.I. bleeding with anemia, gastritis, epigastric pain, hematemesis, dyspepsia, nausea, vomiting and diarrhea, abdominal distention, agranulocytosis, aplastic anemia, hemolytic anemia, anemia due to blood loss including occult G.I. bleeding, thrombocytopenia, pancytopenia, leukemia, leukopenia, bone marrow depression, sodium and chloride retention, water retention and edema, plasma dilution, respiratory alkalosis, metabolic acidosis, fatal and nonfatal hepatitis (cholestasis may or may not be prominent), petechiae, purpura without thrombocytopenia, toxic pruritus, erythema nodosum, erythema multiforme, Stevens-Johnson syndrome, Lyell's syndrome (toxic necrotizing epidermolysis), exfoliative dermatitis, serum sickness, hypersensitivity angiitis (polyarteritis), anaphylactic shock, urticaria, arthralgia, fever, rashes (all allergic reactions require prompt and permanent withdrawal of the drug), proteinuria, hematuria, oliguria, anuria, renal failure with azotemia, glomerulonephritis, acute tubular necrosis, nephrotic syndrome, bilateral renal cortical necrosis, renal stones, ureteral obstruction with uric acid crystals due to uricosuric action of drug, impaired renal function, cardiac decompensation, hypertension, pericarditis, diffuse interstitial myocarditis with muscle necrosis, perivascular granulomata, aggravation of temporal arteritis in patients with polymyalgia rheumatica, optic neuritis, blurred vision, retinal hemorrhage, toxic amblyopia, retinal detachment, hearing loss, hyperglycemia, thyroid hyperplasia, toxic goiter, association of hyperthyroidism and hypothyroidism (causal relationship not established), agitation, confusional states, lethargy; CNS reactions associated with overdosage, including convulsions, euphoria, psychosis, depression, headaches, hallucinations, giddiness, vertigo, coma, hyperventilation, insomnia; ulcerative stomatitis, salivary gland enlargement.

MSMA

NEWS

ROUND - UP

March, 1973

Walter T. Gunn, M.D.
President

E. A. Stricker, M.D.
President-Elect

Dr. Stricker to become MSMA President at Annual Session

Emil A. Stricker, M.D., will become the resident of the Missouri State Medical As-ociation on Saturday night, March 31, dur-g banquet ceremonies at the 115th Annual ession in the Chase-Park Plaza in St. Louis.

Dr. Stricker, a St. James surgeon, will re-eive the gavel from outgoing MSMA Presi-ent, Walter T. Gunn, M.D., of St. Louis.

A native of St. James, Dr. Stricker re-eived his Bachelor of Science degree from ne University of Missouri-Columbia and is M.D. degree from Northwestern Univer-ity Medical School in Chicago. He interned t St. Louis City Hospital. Dr. Stricker is a ellow of the American College of Abdomi-al Surgery.

A member of the Board of Missouri Boystown in St. James, Dr. Stricker is surgeon for the Soldiers Home in St. James, chief of surgery at the Phelps County Hospital in Rolla and operates a medical clinic in Rolla.

Active for many years in civic and fraternal groups, he is past-president of the St. James Chamber of Commerce, St. James Lions Club and St. James Board of Aldermen. He is also past-president of the Phelps County Historical Society and Phelps County Centennial Association. He is a member of the Masonic and IOOF Lodges.

Dr. Stricker, who served as Ninth District Councilor for 12 years before being elected President-Elect last spring, is a noted livestock raiser and has the largest registered Angus herd in Missouri.

QAP will be prime topic at at TAP Institute

QAP

The Quality Assurance Program, a peer review, medical audit and medical utilization plan proposed by the American Hospital Association, will be one of the topics at the TAP Institute, May 11-13 at the Lodge of the Four Seasons, Lake of the Ozarks.

The Institute is an information program designed for physicians, hospital administrators and trustees and is organized by the Joint Commission on Accreditation of Hospitals. The Missouri State Medical Association and the Missouri Hospital Association are co-sponsoring the May meeting.

QAP, which has drawn much interest from physicians and hospitals alike, was added to the Institute program when it became obvious that more information on QAP was urgently needed.

Registration for the Institute may be made by sending a check for $50 to the Missouri Hospital Association, Box 1044, Jefferson City, Mo. 65101.

Upon receipt of the registration fee, each registrant will be mailed a reservation form to complete and return to the Lodge of the Four Seasons.

Tour response is good

The response to the Missouri State Medical Association's summer tour, Scandinavian Adventure, has been good. However, there is still space available for those interested in taking the travel medical seminar.

Physicians and their families who take the tour will leave directly from Kansas City or St. Louis on July 18 for two weeks in Sweden, Finland and Denmark.

The luxury Scandinavian Adventure includes direct round trip flights on chartered World Airways private jets, deluxe hotels, two gourmet meals each day at a choice of the finest restaurants and many more exclusive features. The price for the tour is $868.

Also, arrangements have been made for a comprehensive medical seminar covering a wide variety of medical interests.

For more information on the tour, write for a brochure in care of the Missouri State Medical Association, Box 1028, Jefferson City, Mo. 65101.

MSMA protests Phase 3 controls on physicians

The continuatio
of economic co
trols on physician
under Phase 3 of th
Economic Stabiliz
tion Program h
been protested by th
Missouri State Me
ical Association.

Walter T. Gunn, M.D., Association Pr
ident, issued a News Release outlining th
Association's position and sent copies of th
Release and a letter to Missouri's Congres
men.

"Physicians across the country ha
readily complied with the Administratio
efforts to stabilize wages and prices un
Phases 1 and 2," stated Dr. Gunn. "In fa
physicians' fees rose only 2.7 per cent si
the beginning of controls in August, 19
compated with a 4.3 per cent rise in the
services component of the Consumer Pr
Index."

"The retaining of physicians under t
2.5 per cent mandatory guidelines wh
freeing most of the rest of the econo
from any mandatory guidelines is discri
inatory," said Dr. Gunn. "We only ask th
we be treated in the same manner as oth
professionals — attorneys, accountants, arc
tects, for example — who are under volunta
guidelines."

Dr. Gunn added that to limit physicia
to a mandatory 2.5 per cent fee increa
while, more or less, releasing controls
those services and goods which the phy-
cian must purchase will most certainly ha
an adverse effect on the medical professi

The News Release received wide use
the state media.

Physicians weren't completely forgott
when the President removed most wage a
price controls during Phase 3 of the E
nomic Stabilization Program — *physicia*
according to new regulations, are no long
required to post or keep signs or price sch-
ules for public inspection.

Remodeling work continues

Remodeling work is continuing on th
new Headquarters for the Missouri Sta
Medical Association in Jefferson City.

The building, located at 113 Monr
St., is across the street from the Go
ernor's Mansion and one block from th
State Capitol.

A feature article in the April issue
Missouri Medicine will describe th
building's history, include a map i
dicating its location and show phot
graphs of the structure.

Annual Session set March 29-April 1

A Prelimimary Program detailing activities at the 115th Annual Session of the Missouri State Medical Association has been mailed to all MSMA members.

The Annual Session, to be held March 29 - April 1, at the Chase-Park Plaza in St. Louis, is expected to draw a record number of registrants. To members outside the St. Louis area, reservation cards for the hotel were included with the program.

The Session will feature many high- ;hts including, of course, the Past Presi- nts Banquet, Saturday, March 31. E. A. ricker, M.D., of St. James, will be in- alled as President.

Lt. Gov. William C. Phelps, the first ›publican Lieutenant Governor elected in issouri in 44 years, will be the banquet ›eaker.

Also, Past Presidents of the Association ll be honored as will members of the 50- ›ar Club.

Awards will be presented to medial rep- sentatives as winners in the Missouri State edical Association news competition for 72. Tickets for the banquet and other ents will be on sale at the Registration esk in the hotel.

The scientific session being held as part the 115th Annual Convention of the MSMA ill offer physicians a wide choice of pro- ams on a variety of topics.

Several specialty organizations will spon- ›r continuing medical education programs nd some of the specialty groups are holding nnual meetings along with the MSMA.

The scientific sessions are listed on the ack cover of the Preliminary Program ıailed to members. The entire program is lso published on pages 146-150 of this is- ue.

Scientific sessions are scheduled all day Friday and Saturday, March 30-31. Speakers at the General Session at 9 a.m. Friday will be Rep. James W. Symington, D-Mo., and Rep. Tim Lee Carter, R-Ky.

Symington, of St. Louis, is serving his third term in the House of Representatives. He is a member of the Subcommittee on Public Health and Environment. His topic will be: "Health: The Federal Legislative Challenge."

Rep. Carter, one of three practicing physicians in Congress, will talk on, "The Federal Role in Medicine."

Three speakers will address the General Session at 9 a.m. Saturday. They are Edward C. Rosenow, Jr., M.D., Philadelphia, Pa., Executive Vice-President, American College of Physicians; Robert A. Chase, M.D., Stanford, Calif., Chairman, Graduate Education Committee, American College of Surgeons; and William B. Hildebrand, M.D., Menasha, Wis., Chairman, Council on Medical Services, American Medical Association.

The MSMA House of Delegates will meet at 1:30 p.m. Thursday, March 29; 4 p.m. Friday, March 30; and 7:30 a.m. Sunday, April 1.

Guest speaker at the MSMA General Luncheon at 12:30 p.m. Saturday, March 31, will be James H. Sammons, M.D., Baytown, Tex., Vice Chairman of the AMA Board of Trustees.

A full Auxiliary program is on tap with members and non-members of the Auxiliary invited to attend.

ATTEND YOUR ANNUAL SESSION!!

Council endorses Medicare resolution

The MSMA Council endorsed a policy resolution regarding Medicare payments options during the Feb. 2-3 meeting at Jefferson City.

The resolution, submitted by the Commission on Medical Economics, Third Party Medicine and Governmental Relations, read, "Resolved, that it is the physician's option to use either alternative — assignment or direct billing — he chooses in keeping with his judgement of the patient's needs and the intent of the patient in meeting his obligations to the physician."

The Council considered several other items of business during the two-day meeting, which was held prior to the Annual Public Affairs Conference.

Dr. Finnegan Reappointed

Actions taken by the Council include:

* Reappointed Joseph V. Finnegan, M.D., of St. Louis, as Editor of Missouri Medicine.

* Heard a report that reservations for the MSMA Scandinavia Tour are beginning to mount. The two-week tour will be departing on July 18.

* Was informed that Hector W. Benoit, Jr., M.D., of Kansas City, a Missouri delegate to the AMA and Chairman of Health Care Foundation of Missouri, has been appointed to the AMA Advisory Committee on PSRO legislation which will work with the federal government in investigating methods to implement PSRO legislation passed by Congress.

* Recommended Allen P. Klippel, M.D., of St. Louis, to represent the MSMA on the State Board of Health's Technical Advisory Committee for Medical Communications relating to emergency care situations.

Amphetamine Campaign

* Endorsed the goals of the Cancer Society's Pap Test project.

* Directed staff to inform the news media of the results of campaign to have physicians sign pledge cards to restrict their use of amphetamines and other stimulant drugs. The House of Delegates passed a Resolution in 1972 directing that pledge cards be sent to all MSMA members concerning restricted stimulant drug use. Over 1,700 pledge cards were signed by members.

* Heard a report from the Commission on Medical Economics, Third Party Medicine and Governmental Relations on a Jan. 11 meeting with Aetna Life and Casualty representatives concerning Aetna's letter to patients on physicians' fees.

* Agreed to allow the Auxiliary to the MSMA to sponsor a Hospitality Booth at the Annual Session.

* Okayed the appointment of an Auxiliary Coordinator to the MSMA to improve communications. The Coordinator would be appointed by the MSMA President with the advice of the Auxiliary Medical Advisory Board and the Auxiliary President. The Coordinator or her designated representative, could attend Council, Public Affairs, Legislative and Health Manpower Committee meetings and the annual meeting of the Missouri State Medical Foundation.

* Voted to invite the Speaker of the House to all Council meetings.

* Accepted and filed a report of the Commission on Medical-Legal Affairs dealing with video tape depositions.

HCFM Trial

* Heard a report from legal counsel that the court found in favor of the MSMA in the Health Care Foundation suit trial held in January. Plaintiffs have filed new motions.

* After hearing the report of the Constitution and By-Laws Committee, the Council voted to recommend to the House of Delegates that the Constitutional amendment concerning referendums, which is laying on the table, be changed from "A majority vote of all active members of the Association responding shall determine the question" to read "A two-thirds vote of all active members of the Association responding shall determine the question."

* Concerning the Constitutional amendment laying on the table which would provide for Representation for Medical Students, the Council directed staff to contact Deans of the medical schools and inform them of procedures for electing student delegates and request that elections be held and the student delegates be certified by the Deans. It was pointed out that should the amendment not be adopted, the students could still sit as guests.

* Heard legal counsel's definition of the status of the MSMA Immediate Past President: "The Immediate Past President is a member of the Council by virtue of the Constitution. He is not an Officer or a Councilor but is on the Council in an advisory capacity for continuity."

* Endorsed the Blue Shield Open Panel Health Care Program and urged physicians to support and participate in the program.

* Accepted a detailed Legislative Committee report outlining current health-related bills before the General Assembly.

* Voted to have the Legislative Committee draw up "sick doctor" legislation to be introduced into the General Assembly.

Doctor! Don't Miss This Special

HE MAY TAKE DIURETIC-INDUCED
POTASSIUM LOSS 'TO HEART'

AVOID POTASSIUM DEFICIENCY WITH...

K·LYTE® OR K·LYTE®/CL

otassium supplement

potassium supplement *with* chloride

Manifestations of potassium deficiency may range through a variety of signs nd symptoms including muscular weakness and fatigue...cardiac alterations iscernible by characteristic ECG tracings... impaired mental function and diminished eflexes...impaired respiration... anorexia and abdominal distention.

The etiology of hypokalemia is also broad, encompassing a number of clinical onditions. But most important of all may be a course of treatment that causes xcessive loss of body potassium—such as thiazide diuretics and corticosteroids.

No matter what the etiology, the solution is usually *potassium upplementation.*

What better way to supplement than with K-Lyte or K-Lyte/Cl. Effervesent K-Lyte tablets supply the usually recommended dose of 50 mEq. potassium daily n just two tablets. When chloride is also desirable, K-Lyte/Cl provides it in the preferred 1:1 ratio to potassium. Both forms are accurate and reliable sources of electroyte replacement. Administration in "pre-dissolved" form reduces the potential for G.I. irritation. Finally, you have a choice of three delicious flavors—a taste of oranges, tangy lime or fruit punch—all good enough to drive a patient to drink.

K-Lyte® Each effervescent tablet in solution supplies 25 mEq. potassium as bicarbonate and citrate

K-Lyte®/Cl Each dose of powder in solution supplies 25 mEq. potassium chloride

Each tablet or dose must be completely dissolved before taking.
ndications: K-Lyte and K-Lyte/Cl are oral potassium supplements for therapy or prophylaxis of potassium deficiency. Particularly useful when thiazide diuretics or corticosteroids cause excessive excretory potassium losses. **Contraindiciions:** Impaired renal function with oliguria or azotemia; Addison's dlsease; hyperkalemia from any cause. **Warnings nd Precautions:** Since the amount of potassium deficiency may be difficult to determine accurately, supplements should e administered with caution, and dosages adjusted to the requirements of the individual patient. Potassium intoxication arely occurs in patients with normal kidney function. Symptoms of potassium intoxication are variable. They include istlessness, mental confusion, and tingling of the extremities. Frequent checks of the clinical status of the patient, ECG, and serum potassium level are desirable. In established hypokalemia, attention should also be directed toward other potential electrolyte disturbances. Potassium supplements should be given cautiously to digitalized patients. To minimize the possibility of gastrointestinal irritation associated with the oral ingestion of concentrated potassium salt preparations, patients should be carefully directed to dissolve each dose completely in the stated amount of water. K-Lyte/Cl contains approximately 20-25 Calories of sucrose per dose which should be considered for patients with restriction of aloric intake. **Adverse Reactions:** Nausea, vomiting, diarrhea, and abdominal discomfort may occur with the use of otassium salts. **Dosage and Administration:** Adults: 1 tablet or dose *completely dissolved*, 2 to 4 times daily, depending upon the requirements of the patient: K-Lyte: 1 tablet (25 mEq. potassium) in *3 to 4 ounces of cold or ice water;* K-Lyte/Cl: 1 dose (25 mEq. potassium chloride) in *6 ounces of cold or ice water*. The normal adult daily requirement is approximately 50 mEq. of elemental potassium. NOTE: *It is suggested that these products be taken with meals and sipped slowly over a 5-10 minute period.* **How Supplied:** K-Lyte: Effervescent tablets—boxes of 30 and 250 (orange or lime flavors). K-Lyte/Cl: Powder, cans of 30 measured doses with scoop (fruit-punch flavor). ℞

Preliminary Program

115th Annual Session

MISSOURI STATE MEDICAL ASSOCIATION

Chase-Park Plaza Hotel, St. Louis **March 29-April 1, 1973**

Thursday, March 29

11:00 AM Registration of Delegates.
1:30 PM House of Delegates Meeting, opening session.
3:30 PM Reference Committee Meetings.

Friday, March 30

8:00 AM Registration.

9:00 AM General Session.
Introduction: Walter T. Gunn, M.D., St. Louis, MSMA President.
Health: The Federal Legislative Challenge, Congressman James W. Symington, D-Missouri.
The Federal Role in Medicine, Congressman Tim Lee Carter, R-Kentucky.

10:30 AM Intermission to view exhibits.

10:30 AM *Clinical Allergy—Diagnosis and Treatment.*
Presiding: William T. K. Bryan, M.D., St. Louis, President, Missouri State Allergy Association.
Participants:
Welcome and Introduction, William T. K. Bryan, M.D.
Diagnostic Tests in Allergic Disease, Raymond G. Slavin, M.D., Associate Professor of Internal Medicine and Chief, Section of Allergy and Immunology, St. Louis University School of Medicine, St. Louis.
Hyposensitization, Ralph Hale, M.D., Department of Medicine, Wesley Medical Center and St. Joseph Hospital, Wichita, Kan.
Food Allergy in Alcoholics, George A. Ulett, M.D., Professor and Chief, Department of Psychiatry, University of Missouri School of Medicine, St. Louis.
Sponsored by Missouri State Allergy Association.

*11:00 AM *Newer Techniques in the Diagnosis and Treatment of Thyroid Disease.*
Moderator: Thomas F. Frawley, M.D., St. Louis.
Panel Participants:
John Lindeman, M.D., St. Louis.
Garrett Hagen, M.D., St. Louis.
Lewis Chase, M.D., St. Louis.
Sponsored by Missouri Society of Internal Medicine and the Missouri Chapter, American College of Physicians.

*11:00 AM *Newer Aids in the Diagnosis of Connective Tissue Disease,* John D. Arnold, M.D., Director Harry S Truman Research Laboratory, Kansas City.
Newer Treatments in Connective Tissue Disease, Jack Zuckner, M.D., St. Louis.
Sponsored by Missouri Society of Internal Medicine and the Missouri Chapter, American College of Physicians.

*11:00 AM *Developmental Dyslexia and a Rational Approach to Management,* Norman E. Silberberg, Ph.D., Director of Research and Program Development, Kenny Rehabilitation Institute, Minneapolis, Minn.
Moderator: Warren A. Weinberg, M.D., St. Louis.
Panel Discussants:
Philip R. Dodge, M.D., Professor and Chairman, Department of Pediatrics and Professor of Neurology, Washington University School of Medicine, St. Louis.
Richard Burnett, Ed.D., Professor of Education and Director of the Reading Clinic, University of Missouri-St. Louis.
Warren A. Weinberg, M.D., Assistant Professor, Department of Pediatrics and Neurology, Washington University School of Medicine, St. Louis.
Manic-Depressive Illness in Children: Recognition and Treatment, Warren A. Weinberg, M.D., St. Louis.
Sponsored by Missouri Chapter, American Academy of Pediatrics.

---

* Concurrent Sessions.

*11:00 AM *Psychiatric Sequelae of Vasectomy.*
Moderator: Ralph L. Biddy, M.D., St. Louis.
Panel Participants:
I. M. Thompson, M.D., Professor and Chief, Department of Urology, University of Missouri, Columbia.
Gilbert Ross, Jr., M.D., Department of Urology, University of Missouri, Columbia.
(Additional panelists to be announced.)
Sponsored by Missouri Psychiatric Association and Missouri Academy of Psychiatry.

*11:00 AM *Management of Pulmonary Complications.*
Moderator: Arthur E. Baue, M.D., St. Louis.
Participants:
Aspiration Pneumonia, George D. Zuidema, M.D., Warfield M. Firor Professor and Director, Department of Surgery, Johns Hopkins University School of Medicine, Baltimore, Md.
Prevention of Recurrent Pulmonary Emboli, Marion S. De Weese, M.D., W. Alton Jones Professor and Chairman, Department of Surgery, University of Missouri School of Medicine-Columbia.
Use and Abuse of Tracheotomy and Endotracheal Tubes, Alan R. Hopeman, M.D., Professor of Surgery (Thoracic), University of Missouri School of Medicine-Columbia.
Sponsored by Missouri State Surgical Society.

12:30 PM Missouri University Alumni Luncheon.
Youth and School Committee, Missouri Chapter, American Academy of Pediatrics Luncheon. (Open to all physicians.)
Missouri Academy of Psychiatry Luncheon.
Maternal Welfare Luncheon. Missouri Obstetrical-Gynecological Society.

* 2:00 PM *Clinical Allergy—Diagnosis and Treatment* (Continued).
Presiding: Orval R. Withers, M.D., Clinical Professor of Medicine Emeritus, University of Kansas School of Medicine, Kansas City, Kan.
Participants:
37 Years of ENT Allergy, George E. Shambaugh, Jr., M.D., Emeritus Professor of Otolaryngology, Northwestern University School of Medicine, Chicago, Ill.
Allergic Middle Ear Disease, Jack D. Clemis, M.D., Associate Professor of Otolaryngology, Northwestern University School of Medicine, Chicago, Ill.
The Effect of Allergy on the Nervous System, Frederic Speer, M.D., Director, Pediatric Allergy, University of Kansas Medical Center, Kansas City, Kan.
Adrenergic Theory of Bronchial Asthma, Charles W. Parker, M.D., Professor of Medicine, Division of Immunology, Washington University School of Medicine, St. Louis.
Panel—Entire Faculty—Allergy—Questions and Answers.
Moderator: James W. Willoughby, M.D., Lecturer in Medicine, University of Missouri-Kansas City School of Medicine.
Sponsored by Missouri State Allergy Association.

* 2:00 PM *The Management of Chronic Renal Failure.*
Moderator: John Maher, M.D., Columbia.
Panel Participants:
Robert Cuddihee, M.D., St. Louis.
Herbert Lubowitz, M.D., St. Louis.
Thomas T. Crouch, M.D., Kansas City.
Sponsored by Missouri Society of Internal Medicine and the Missouri Chapter, American College of Physicians.

* 2:00 PM *Hypoglycemic Agents Revisited,* Marvin E. Levin, M.D., Assistant Professor, Clinical Medicine, Washington University School of Medicine, St. Louis.
Hyperlipidemia: Its Significance and Management, Neville Grant, M.D., Assistant Professor, Clinical Medicine, Washington University School of Medicine, St. Louis.
Sponsored by Missouri Society of Internal Medicine and the Missouri Chapter, American College of Physicians.

* 2:00 PM *Abdominal Pain and Multiple Surgery—A Psychosomatic Condition?*
Moderator: Ralph L. Biddy, M.D., St. Louis.
Panel Participants:
David Davis, M.D., Professor of Psychiatry and Associate Chairman, Department of Psychiatry, University of Missouri School of Medicine, Columbia.
Richard T. Quick, M.D., Assistant Professor of Psychiatry, St. Louis University, St. Louis.

---

* Concurrent Sessions.

Richard L. Sterkel, M.D., Gastroenterologist, St. Louis.
W. E. Bazzoui, M.D., Clinical Director, Mid-Missouri Mental Health Center, Columbia.
Sponsored by Missouri Psychiatric Association and Missouri Academy of Psychiatry.

* 2:00 PM *Pancreatic and Biliary Disease.*
Moderator: Hugh E. Stephenson, Jr., M.D., Columbia.
Participants:
Unusual Aspects of Pancreatic Disease, George D. Zuidema, M.D., Warfield M. Firor Professor and Director, Department of Surgery, Johns Hopkins University, School of Medicine, Baltimore, Md.
Biliary Tract Infections, William W. Shingleton, M.D., Professor of Surgery, Duke University, School of Medicine, Durham, N. C.
Sponsored by Missouri State Surgical Society.

3:30 PM Intermission to view exhibits.
4:00 PM House of Delegates, second session.
5:30 PM Missouri State Medical Foundation Annual Meeting.
6:00 PM Reference Committee Meetings.
6:00 PM Dinner Meeting: Missouri State Allergy Association.
6:30 PM Dinner Meetings:
Missouri Psychiatric Association and Missouri Academy of Psychiatry.
Speaker: Warren Williams, M.D., Speaker-Elect, Assembly of District Branches of the American Psychiatric Association, Tucson, Ariz.
Subject: *"The Structure, Objectives and Current Alternatives for the APA."*
Missouri State Surgical Society—University Club.
Speaker: Walter F. Ballinger, II, M.D., Bixby Professor of Surgery and Head of the Department, Washington University School of Medicine, St. Louis.
Subject: *"Organization, Financing, and Delivery of Surgical Services in the United States."*

Saturday, March 31

8:00 AM Registration
* 9:00 AM *Whither Medicine.*
Moderator: Maxwell G. Berry, M.D., Kansas City.
Participants:
Assurance of Quality by Knowledge and Performance or—How Else?, Edward C. Rosenow, Jr., M.D., Executive Vice-President, American College of Physicians, Philadelphia, Pa.
Dynamic Reform in Graduate Education and Credentialing, Robert A. Chase, M.D., Chairman, Graduate Education Committee, American College of Surgeons and Emile Holman Professor of Surgery and Chairman, Department of Surgery, Stanford University School of Medicine, Stanford, Calif.
The New Economics of Health Care, William B. Hildebrand, M.D., Chairman, Council on Medical Services, American Medical Association, Menasha, Wis.

* 9:00 AM *Postoperative Respiratory Care,* Henrik Bendixen, M.D., Professor and Chairman, Department of Anesthesia, University of California, San Diego, Calif.
Moderator: Robert W. Vaughan, M.D., St. Louis.
Sponsored by Missouri Society of Anesthesiologists.

10:30 AM Intermission to view exhibits.
10:30 AM *Health Care Team Concept—Spinal Cord Injury System.*
Moderator: Saul Boyarsky, M.D., St. Louis.
Participants:
Franz U. Steinberg, M.D., Chief of Physical Medicine and Rehabilitation, Jewish Hospital and Assistant Professor of Medicine, Washington University School of Medicine, St. Louis.
Simon Horenstein, M.D., Professor and Chairman, Department of Neurology, St. Louis University School of Medicine, St. Louis.
Henry G. Schwartz, M.D., Professor and Head, Division of Neurosurgery, Washington University School of Medicine, St. Louis.
Saul Boyarsky, M.D., Professor and Head of Division of Urological Surgery, Washington University School of Medicine.
(With invited discussants)

*11:00 AM *Medicine, Surgery, Anesthesia and Hepatitis,* David M. Little, Jr., M.D., Staff Anesthesiologist, Hartford Hospital, Hartford, Conn.
Moderator: Robert W. Vaughan, M.D., St. Louis.
Sponsored by Missouri Society of Anesthesiologists.

---

* Concurrent Sessions.

*11:00 am *Medical Oncology—An Emerging Specialty.*
Moderator: Andrew McCanse, M.D., Kansas City.
Participants:
Principles of Cancer Chemotherapy, Reginald P. Pugh, M.D., Columbia.
Treatment of Solid Tumors, Joel Zeffren, M.D., St. Louis.
Treatment of Hematologic Malignancies, Virgil Loeb, Jr., M.D., St. Louis.
Sponsored by Missouri Division, American Cancer Society.

*11:00 am *Newer Approaches to the Management of Coronary Artery Disease.*
Moderator: G. Charles Oliver, M.D., St. Louis.
Panel Participants:
Alexander S. Geha, M.D., St. Louis.
J. Gerard Mudd, M.D., St. Louis.
Jon Cooksey, M.D., Assistant Professor of Preventive Medicine and Medicine, Washington University School of Medicine, St. Louis.
Richard B. Whiting, M.D., Assistant Professor of Medicine, St. Louis University School of Medicine, St. Louis.
Sponsored by Missouri Society of Internal Medicine and the Missouri Chapter, American College of Physicians.

*11:00 am *The Problem of Diabetic Retinopathy,* Francis A. L'Esperance, M.D., Assistant Professor of Clinical Ophthalmology, Columbia University College of Physicians and Surgeons and Director of John A. Hartford Laser Laboratory, New York, N. Y.
Moderator: Anwar Shah, M.D., St. Louis
Panel Discussants:
Isaac Boniuk, M.D., St. Louis.
King Y. Lee, M.D., Assistant Clinical Professor of Ophthalmology, University of Missouri, Kansas City.
Anwar Shah, M.D., St. Louis.
Sponsored by the Missouri Ophthalmological Society, Inc.

*11:00 am *Symposium on Health Care Costs.*
(Participants to be announced.)

12:30 pm **MSMA General Luncheon.**
Guest Speaker—James H. Sammons, M.D., Vice Chairman, Board of Trustees, American Medical Association, Baytown, Tex.
Fifty-Year Club Luncheon.
Missouri Ophthalmological Society, Inc., Luncheon.
Missouri State Society of Neurological Surgeons Luncheon.
Physiatrists Luncheon.

1:30 pm *Diagnostic Radiology in Obstetrics and Gynecology,* Lawrence A. Pilla, M.D., Assistant Clinical Professor of Radiology, St. Louis University, St. Louis. (This program is of general interest.)
Moderator: William H. McAlister, M.D., St. Louis.
Sponsored by Missouri Radiological Society.

* 2:30 pm *Cutaneous Manifestations of Internal Disease,* W. Mitchell Sams, Jr., M.D., Professor and Head, Division of Dermatology, University of Colorado Medical Center, Denver, Colo.
Moderator: Norman Asel, M.D., Columbia.
Sponsored by Missouri Dermatological Society, Inc.

* 2:30 pm *Cerebrovascular Disease and the Management of the Post-Phlebitic Extremity.*
Moderator: Albert M. Estes, M.D., Cape Girardeau.
Participants:
Pathogenesis and Diagnosis of Cerebral Ischemia, William S. Fields, M.D., Professor of Neurology, University of Texas Medical School, Houston, Tex.
Surgical Management of Cerebrovascular Insufficiency, Jesse E. Thompson, M.D., Clinical Professor of Surgery, University of Texas Southwestern Medical School, Dallas, Tex.
The Management of the Post-Phlebitic Extremity, Charles R. Doyle, M.D., Professor of Clinical Surgery, St. Louis University School of Medicine, St. Louis.
Sponsored by Missouri Heart Association, Inc.

* 2:30 pm *How I Do It.*
Moderator: Frank L. Mitchell, M.D., Columbia.
Participants:
How I Treat Circulatory Failure, Arthur E. Baue, M.D., St. Louis.
How I Do Peritoneal Patch Pyloroplasty, Cyril J. Costello, M.D., St. Louis.
A New Surgical Retractor, Hugh A. Hanna, M.D., Warrensburg.
How I Decide on Operative Cholangiogram, Max A. Heeb, M.D., Sikeston.
How I Evaluate Postoperative Oliguria, Paul G. Koontz, M.D., Kansas City.

---

* Concurrent Sessions.

How I Perform Colostomy in Children, James E. Lewis, Jr., M.D., St. Louis.
How I Choose Excisions in Breast Disease, Charles E. Lockhart, M.D., Springfield.
How I Evaluate the Trauma Patient, Andrew McCanse, M.D., Kansas City.
How I Staple Suture the Intestine, Charles P. McGinty, M.D., Cape Girardeau.
How I Do Autotransfusion in Massive Hemorrhage, Horace E. Thomas, M.D., Columbia.
How I Prevent Periprosthetic Valve Heart Leaks, Clarence Weldon, M.D., St. Louis.
How I Do Intravenous Tourniquet Block Anesthesia, Earl J. Wipfler, Jr., M.D., St. Charles.
Sponsored by Missouri State Surgical Society.

° 2:30 PM Value of Periodic Physical Examinations.
(Participants to be announced.)

° 2:30 PM Physician Assistant.
(Participants to be announced.)

3:00 PM *Radiology of Total Hip Replacement*, Tom W. Staple, M.D., Associate Professor of Radiology, Mallinckrodt Institute of Radiology, Washington University School of Medicine, St. Louis.
A Roentgen Approach to GI Obstruction in Children, Gary D. Shackelford, M.D., Instructor in Radiology, Mallinckrodt Institute of Radiology, Washington University School of Medicine, St. Louis.
Necrotizing Enterocolitis, John C. Leonidas, M.D., Kansas City.
Moderator: William H. McAlister, M.D., St. Louis.
Sponsored by Missouri Radiological Society.

4:00 PM Intermission to view exhibits.

5:00 PM St. Louis University Medical Alumni Cocktail Party.

5:00 PM Washington University Medical Alumni Cocktail Party.

TBA† Missouri Dermatological Society, Inc., Cocktails and Dinner (Courtesy of Westwood Pharmaceuticals)—St. Louis Club, Pierre Laclede Center, 7701 Forsyth, Clayton.

6:30 PM Social Hour for those Attending Banquet.

7:15 PM Annual Banquet in Honor of Past-Presidents.

Sunday, April 1

7:30 AM House of Delegates, breakfast and final session.

TBA† *Autoimmune Dermatologic Diseases*, W. Mitchell Sams, Jr., M.D., Professor and Head, Division of Dermatology, University of Colorado Medical Center, Denver, Colo.—Wohl Clinic, 5th Floor, Washington University School of Medicine, 4950 Audubon.
Sponsored by Missouri Dermatological Society, Inc.

° Concurrent Sessions.
† Time to be announced.

IN ASTHMA
IN EMPHYSEMA

optional therapy

THE mudranes®

All Mudranes are bronchodilator-mucolytic in action, and are indicated for symptomatic relief of bronchial asthma, emphysema, bronchiectasis and chronic bronchitis. **MUDRANE tablets** contain 195 mg. potassium iodide; 130 mg. aminophylline; 21 mg. phenobarbital (Warning: may be habit-forming); 16 mg. ephedrine HCl. **Dosage** is one tablet with full glass of water, 3 or 4 times a day. **Precautions** are those for aminophylline-phenobarbital-ephedrine combinaations. **Iodide side-effects:** May cause nausea. Very long use may cause goiter. Discontinue if symptoms of iodism develop. **Iodide contraindications:** Tuberculosis; pregnancy (to protect the fetus against possible depression of thyroid activity). **MUDRANE-2 tablets** contain 195 mg. potassium iodide; 130 mg. aminophylline. **Dosage** is one tablet with full glass of water, 3 or 4 times a day. **Precautions** are those for aminophylline. **Iodide side-effects and contraindications are listed above. MUDRANE GG tablets** contain 100 mg. glyceryl guaiacolate; 130 mg. aminophylline; 21 mg. phenobarbital (Warning: may be habit-forming); 16 mg. ephedrine HCl. **Dosage** is one tablet with full glass of water, 3 or 4 times a day. **Precautions** are those for aminophylline-phenobarbital-ephedrine combinations. **MUDRANE GG-2 tablets** contain 100 mg. glyceryl guaiacolate; 130 mg. aminophylline. **Dosage** is one tablet with full glass of water, 3 or 4 times a day. **Precautions:** Those for aminophylline. **MUDRANE GG Elixir.** Each teaspoonful (5 cc) contains 26 mg. glyceryl guaiacolate; 20 mg. theophylline; 5.4 mg. phenobarbital (Warning: may be habit-forming); 4 mg. ephedrine HCl. **Dosage:** Children, 1 cc for each 10 lbs. of body weight; one teaspoonful (5 cc) for a 50 lb. child. Dose may be repeated 3 or 4 times a day. Adult, one tablespoonful, 4 times daily. All doses should be followed with ½ to full glass of water. **Precautions:** See those listed above for Mudrane GG tablets.

MUDRANE—original formula
First choice

MUDRANE-2
When ephedrine is too exciting
or is contraindicated

MUDRANE GG
During pregnancy or when K.I. is
contraindicated or not tolerated

MUDRANE GG-2
A counterpart for Mudrane-2

MUDRANE GG ELIXIR
For pediatric use
or where liquids are preferred

Clinical specimens
available to physicians.

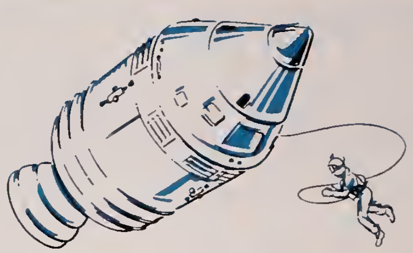
Manufacturers of Ethical Pharmaceuticals



Man in space, now fait accompli, re-emphasizes the importance of Uro-Phosphate therapy. Research into the effect of space travel on the astronaut reveals that weightlessness causes loss of bone calcium. As the bones are required to bear less and less of the weight of the body they lose calcium, increasing the calcium content of the urine. When physical activity is reduced, the acidity of the urine should be adjusted to keep increased calcium in solution . . . . a prophylaxis to prevent kidney or bladder calculi.

Uro-Phosphate®

NOW A SUGAR-COATED TABLET

Each tablet contains: METHENAMINE, 300 mg.; SODIUM ACID PHOSPHATE, 500 mg.

Uro-Phosphate gives comfort and protection when inactivity causes discomfort in the urinary function. It keeps calcium in solution, preventing calculi; it maintains clear, acid, sterile urine; it encourages complete voiding and lessens frequency when residual urine is present.

Uro-Phosphate contains sodium acid phosphate, a natural urinary acidifier. This component is fortified with methenamine which is inert until it reaches the acid urinary bladder. In this environment it releases a mild antiseptic keeping the urine sterile.

Uro-Phosphate is safe for continuous use. There are no contra-indications other than acidosis. It can be given in sufficient amount to keep the urine clear, acid and sterile. A heavy sugar coating protects its potency.

Dosage:

For protection of the inactive patient 1 or 2 tablets every 4 to 6 hours is usually sufficient to keep the urine clear, acid and sterile.

2 tablets on retiring will keep residual urine acid and sterile, contributing to comfort and rest.

A clinical supply will be sent to physicians and hospitals on request.

Yeshiva University

I think that there can be a very great distinction between generic drugs and brand name drugs. And that applies to products of original research that have outlived their patent protection as well as to drugs that have long been in the public domain. Let me explain why.

The Importance of the Manufacturing Environment

In terms of formulation, quality control, and the ability to reproduce an essentially identical product, batch after batch, I doubt that many firms are properly equipped to put out a product that is as carefully controlled as the product marketed by a pharmaceutical company with sophisticated research and high quality manufacturing facilities. For example, when a company comes out with its own preparation of a drug that has just lost its patent protection, there is no assurance that the drug it produces will be a therapeutic equivalent. The raw material could be identical and yet bioavailability might vary from complete unavailability to that which is equivalent to the original.

It Isn't Enough to Meet USP and NF Standards

Meeting USP and NF standards is not enough to guarantee therapeutic equivalence. In certain instances, stricter standards must be applied. Right now, the New York Heart Association has a committee that is studying the problem of digoxin equivalency. I am certain that they are going to recommend a bioavailability assay of a particular digoxin. Unless this is done, they will not recommend it for purchase or use in New York City hospitals. It represents too much of a hazard. They have gone so far as to recommend a batch-by-batch certification of bioavailability even though the company has been reproducing and marketing a digoxin product through the years.

The Problem of Controlling Bioavailability of Generics

The FDA does not have the manpower to inspect the quality control capabilities of hundreds of houses specializing in generic products. And I don't think that the average pharmacist is knowledgeable or aware of the quality and bioavailability of the infinite numbers of generic preparations. A recommendation has been made that every time a generic house (or for that matter a large pharmaceutical company) markets an already existing drug for the first time, a modified new drug application should be submitted. The manufacturer would have to show that his compound is the therapeutic equivalent of the standard compound in use, assuming that the standard compound is one that has been available for an extended period—say 15 years. This would be one indication that the control of bioavailability is beginning to get the attention that it deserves.

Clinical Predictab More Important Tha

Growing Awareness of Potential for Nonequivalence

experience increases
drug substances de-
from different sources
under different condi-
, it should be possible
ablish specifications in
ient detail to minimize
otential for their non-
valence. However,
is general agreement
product therapeutic
valence would still not
ssured even if one could
minimize nonequivalence of drug components produced by different manufacturers. Arguments relate largely to the extent of product inequivalences. Experience over the past six years has uncovered a greater incidence of nonequivalence of products prepared by different manufacturers from generically equivalent substances than many had previously surmised.

Newer Bioavailability Studies Reveal Differences

Bioavailability may be defined as a measure of the rate and amount of absorption of a drug substance from its administered dosage form. For several years pharmaceutical scientists have proposed that bioavailability data on presumably equivalent dosage forms provide the best measure of product equivalence—short of adequate clinical trial. In their continued search for shortcuts to the evaluation of product equivalence, medical and pharmaceutical scientists have increasingly relied upon bioavailability characteristics as reflected by blood levels of a drug after its administration to human subjects.

Leading manufacturers now conduct comparative bioavailability studies on their own product dosage forms after production process changes that would have been considered inconsequential a few years ago. This isn't surprising, since there are so many possible differences in production operations that the opportunities for inequivalent generic and brand name products are numerous—even when the production process begins with identical chemical substances. Moreover, reputable manufacturers are striving to improve *in vitro* control measures, such as dissolution characteristics, which are being related more meaningfully to bioavailability reference data.

As a result of advances in scientific instrumentation and analytical methodology which permit measurements of small quantities of drug substances in the body, our abilities to detect differences in bioavailability and possible therapeutic nonequivalance have appreciably improved.

Product Selection Based on Patient Response

Improved specifications and standards can better assure the equivalence of *drug substances*. Manufacturers, compendia and regulatory agencies can all play a part. However, it is the *drug product*, not the *drug substance*, that the physician, pharmacist, nurse and patient-customer utilize. How can these individuals make or influence specific product selections to minimize variations in therapeutic equivalence of multisource drugs? Patients' responses to a drug product provide a basis of experience to aid the physician in his selection of a particular product. The nurse and pharmacist can also help detect patient responses, but ultimate responsibility must remain with the physician.

Reputation of Manufacturer as Basis for Product Selection

The physician, to assure that his patients receive quality health care, must rely upon the capabilities of the reputable pharmaceutical manufacturer who is equipped to develop, prepare and control a quality product of uniform, reliable therapeutic performance. Substitution with purportedly equivalent generic products that are only superficially evaluated by an imitator manufacturer can place the health of the patient secondary to factors of price or convenience for the provider.

Opinion & Dialogue

What is your opinion, doctor?
We would welcome your comments.

MINOCIN® made the difference in just eight days.*

Clinical Data:

Patient: 47-year-old male.
Diagnosis: Severe pyoderma, left hand.
Culture: *Staphylococcus aureus, coagulase* positive and sensitive to MINOCIN.
Temperature: 102° F
Therapy: MINOCIN Minocycline HCl Capsules, 100 mg: 200 mg *stat,* 100 mg every 12 hours. Medication began 9/7/71. By fourth day, temperature was normal and pustular lesions considerably improved. Last dose taken 9/14/71.
Concomitant therapy: None.†

Semisynthetic
MINOCIN®
MINOCYCLINE HCl
Capsules, 100 mg: 2 *stat,* 1 q 12 h.

Indications: For the treatment of susceptible infections; *e.g., E. coli, D. pneumoniae.* For full list of approved indications consult labeling.
Contraindications: Hypersensitivity to any tetracycline.
Warnings: The use of tetracyclines during tooth development (last half of pregnancy, infancy and childhood to the age of 8 years) may cause permanent discoloration of the teeth (yellow-gray-brown). This is more common during long-term use but has been observed following repeated short-term courses. Enamel hypoplasia has also been reported. Tetracyclines, therefore, should not be used in this age group unless other drugs are not likely to be effective or are contraindicated. In renal impairment, usual doses may lead to excessive accumulation and liver toxicity. Under such conditions, use lower total doses, and, in prolonged therapy, determine serum levels. Photosensitivity manifested by an exaggerated sunburn reaction has also been observed in some individuals taking tetracyclines. Advise patients apt to be exposed to direct sunlight or ultraviolet light that such reaction can occur, and discontinue treatment at first evidence of skin erythema. Studies to date indicate that photosensitivity does not occur with MINOCIN Minocycline HCl. In patients with significantly impaired renal function, the antianabolic action of tetracycline may cause an increase in BUN, leading to azotemia, hyperphosphatemia, and acidosis. CNS side effects (lightheadedness, dizziness, vertigo) have been reported, may disappear during therapy, and always disappear rapidly when drug is discontinued. Caution patients who experience these symptoms about driving vehicles or using hazardous machinery while taking this drug. *Pregnancy:* In animal studies, tetracyclines cross the placenta, are found in fetal tissues, and can have toxic effects on the developing fetus (often related to retardation of skeletal development). Embryotoxicity has been noted in animals treated early in pregnancy. Safety of use during human pregnancy has not been established. *Newborns, infants and children:* All tetracyclines form a stable calcium complex in any bone-forming tissue. Prematures, given oral doses of 25 mg./kg. every 6 hours, demonstrated a decrease in fibula growth rate, reversible when drug was discontinued. Tetracyclines are present in the milk of lactating women who are taking a drug of this class.

Precautions: Use may result in overgrowth of nonsusceptible organisms, including fungi. If superinfection occurs, institute appropriate therapy. In venereal diseases when coexistent syphilis is suspected, darkfield examination should be done before treatment is started and blood serology repeated monthly for at least four months. Because tetracyclines have been shown to depress plasma prothrombin activity, patients on anticoagulant therapy may require downward adjustment of such dosage. Test for organ system dysfunction (*e.g.,* renal, hepatic and hemopoietic) in long-term use. Treat all Group A beta hemolytic streptococcal infections for at least 10 days. Avoid giving tetracycline in conjunction with penicillin.

Adverse Reaction: GI: (with both oral and parenteral use): anorexia, nausea, vomiting, diarrhea, glossitis, dysphagia, enterocolitis, inflammatory lesions (with monilial overgrowth) in anogenital region. *Skin:* maculopapular and erythematous rashes. Exfoliative dermatitis (uncommon). Photosensitivity is discussed above ("Warnings"). *Renal toxicity:* rise in BUN, dose-related (see "Warnings"). *Hypersensitivity reactions:* urticaria, angioneurotic edema, anaphylaxis, anaphylactoid purpura, pericarditis, exacerbation of systemic lupus erythematosus. In young infants, bulging fontanels have been reported following full therapeutic dosage, disappearing rapidly when drug was discontinued. *Blood:* hemolytic anemia, thrombocytopenia, neutropenia, eosinophilia. *CNS:* (see "Warnings.") When given in high doses, tetracyclines may produce brown-black microscopic discoloration of thyroid glands; no abnormalities of thyroid function studies are known to occur.

NOTE: Concomitant therapy: Antacids containing aluminum, calcium, or magnesium impair absorption; do not give to patients taking oral minocycline. Studies to date indicate that absorption of MINOCIN is not notably influenced by foods and dairy products.

***Indicated in infections due to susceptible organisms. Culture and sensitivity testing recommended. Tetracylines are not the drugs of choice in the treatment of any staphylococcal infection.**

Notes of interest from Here .... and There

Dr. Eugene M. Bricker and **Dr. Vallee L. Willman** were honored as the 23rd and 24th recipients of the St. Louis Medical Society's Gold Medal and Award of Merit at the Society's annual meeting on January 13. The Award is in recognition of meritorious effort by a physician when such efforts promise results of great benefit to humanity and the progress of scientific medicine. Dr. Bricker, Professor of Clinical Surgery at Washington University, is recognized internationally for his contributions to the development of plastic and reconstructive surgery. He has served as President of the Society of University Surgeons, Vice-President of the American Surgical Association, Vice-President of the American College of Surgeons, Chairman of the American Board of Surgery and Director of Plastic Surgery in the European Theater of Operations during World War II. Dr. Willman, Chairman of the Department of Surgery at St. Louis University, has received international recognition for his investigations in cardiovascular physiology and pathophysiology. A recent successful transplantation of a human heart by Dr. Willman and his associates received wide acclaim.

In recognition of their many contributions to the medical community, Honor Memberships were presented to **Dr. William H. Danforth, Dr. Raymond O. Muether** and **Dr. Jerome I. Simon** by the St. Louis Medical Society. Dr. Danforth is Chancellor of Washington University; Dr. Muether is professor of Internal Medicine and Pathology at St. Louis University and a Past-President of both the St. Louis Medical Society and the MSMA; and Dr. Simon is a Past-President of the St. Louis Medical Society and the St. Louis Surgical Society.

Dr. Gerald L. Miller and **Dr. Hector W. Benoit, Jr.** of Kansas City were presented the Merit Award of Jackson County Medical Society at the Annual President's Dinner on January 19. The award was established in 1941 as a symbol of professional appreciation. Purpose of the award is to demonstrate to the community and to state and national bodies of the medical profession that the contributions and spirit of certain outstanding members of Jackson County Medical Society are recognized by their peers and colleagues. Dr. Miller is Immediate Past-President of the MSMA and Dr. Benoit is a Past-President of the MSMA and a Delegate to the AMA. Merit awards have been presented previously to 20 other members of the Society. **Dr. Carroll P. Hungate** of Kansas City received two awards at the event.

Dr. Richard A. Sutter, University City, was elected to Honor Membership by the St. Louis County Medical Society on January 27. He is the eighth recipient of the award in the 69-year history of the Medical Society. The award was presented to Dr. Sutter in recognition of more than 35 years of outstanding service in the field of occupational medicine and in recognition of his professional achievements, civic interests and awards. The award cites his service as a member of the AMA Council on Occupational Health, a member of the Missouri Governor's Council on Occupational Safety and Health Task Force and a presidential appointee to the National Advisory Committee on Occupational Safety and Health among other national, state and local medical and civic associations.

WASHINGTON

The American Medical Association protested vigorously against President Nixon keeping physicians under federal regulation in Phase III of the economic controls program.

A largely voluntary set of wage-price controls was substituted for all segments of the nation's economy except food, health care activities, the construction industry and interest and dividends.

John R. Kernodle, M.D., chairman of the AMA Board of Trustees, warned that such discriminatory treatment well could result in health care support personnel leaving the field. Physicians, he said, could not be expected to accept it.

"Controls are relaxed in other areas, yet the discrimination against physicians and some three million others who serve America's health needs is now even more sharply focused," Dr. Kernodle said in a statement. "A very real possibility exists that there will be a flight of allied, ancillary and support personnel from the health field, jeopardizing the quality of care being delivered."

Dr. Kernodle pointed out that "even though the regulations as applied to health care were clearly discriminatory," the AMA had urged physicians to cooperate and they had done so with a result that their fees nationwide had increased by only 2.7% since August, 1971 when Phase I began. This compared with 4.3% for the consumer price index, 6.2% for a semi-private hospital room and 14% for legal services.

Noting that controls never were imposed on lawyers or other self-employed professionals, he said that physicians now might have to reconsider their attitude of cooperation.

"Since its inception, we in medicine have made every effort to cooperate with the government's program," Dr. Kernodle said. "While the Lords of Labor walked out, we remained in the program and tried to make it work in the public interest. The results speak for themselves.

"We have received very little cooperation in return. . . .

"Thirteen months ago, we urged physician compliance. In light of the . . . record, we shall now have to reconsider that advice."

Dr. Kernodle later took the AMA protest directly to President Nixon in a letter. It follows:

Dear Mr. President:

The American Medical Association has applauded your Administration's efforts to stabilize prices and wages for the economy. The Association has supported the overall objectives of the Economic Stabilization Program and actively cooperated with the Cost of Living Council through the Health Services Industry Committee in the application of price controls on physicians' fees.

A look at the physician component of the Consumer Price Index gives an example of the effect that "voluntary compliance" can have in curbing inflation. As a result of this Association's activities, physicians' fees rose only 1.7% under Phase II. This constitutes one third the rate of increases prior to the Economic Stabilization Program. In this respect, we have surpassed the original expectations of the Cost of Living Council, which called for halving the inflationary rates prior to Phase I.

In view of our demonstrated success during the past year, you can imagine our dismay at the announcement of plans for Phase III. Although most of the economy is now expected to "voluntarily" adhere to the general guidelines of the Cost of Living Council, the medical profession has been placed under mandatory regulations. Indeed, the medical profession has once again been singled out under special controls. The physicians of America will not accept such discriminatory treatment. This profession must not become the victim of efforts to curb inflation in the more expensive components of the health care industry, which due to their internal financial structure have been unable to decelerate increases in their prices.

The record of the past year clearly demonstrates that physicians are able to effectively control their fees through voluntary action. The record of the past year is equally clear that physicians' fees have not been an inflationary factor in health care costs. We, therefore, request that the medical profession be exempt from special regulations under Phase III, and respectfully request an early opportunity to visit with you on this and other matters of critical importance to the nation and the medical profession.

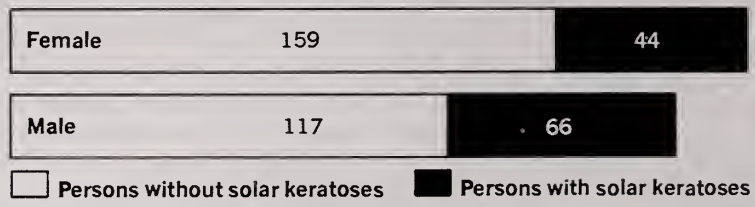
What it means to live and work i Tipton County, Tennessee

Persons who are white and over 40 have one chance in four of having solar keratoses... which may be premalignant

An epidemiologic study* conducted in Tipton County, Tennessee, revealed that 28.5% of white persons over 40 had solar keratoses; most had multiple lesions. Cluster sampling projected an estimated prevalence of 32.5% for white males and 19.5% for white females.

Though this is an unusually high percentage of affected persons, these lesions can occur in any white population, wherever people work or play out of doors.

Prevalence of solar keratoses in white persons over 40 in Tipton County, Tennessee



*Data on file, Hoffmann-La Roche Inc., Nutley, New Jersey.

lar, actinic, senile keratoses

ed by many names, the typical lesion is flat ightly elevated, brownish or reddish in r, papular, dry, adherent, rough, sharply ned; usually multiple lesions, chiefly on osed portions of the skin.

quence/selectivity of response

hema in areas of lesions may begin after ral days of therapy; height of reaction y in affected areas)* usually occurs within weeks, declining after discontinuation of apy. Since this response is so predictable, ns that do not respond should be biopsied le out the presence of a frank neoplasm.

smetic results

netic results are highly favorable. Incie of scarring is low—important with multiacial lesions. Efudex should be applied care near the eyes, nose and mouth.

cream–a Roche exclusive

Roche formulates the 5% cream... in patient acceptability...high in clinical acy, especially for lesions of hands and arms...economical.

Before prescribing, please consult complete product information, a summary of which follows:
Indications: Multiple actinic or solar keratoses.
Contraindications: Patients with known hypersensitivity to any of its components.
Warnings: If occlusive dressing used, may increase inflammatory reactions in adjacent normal skin. Avoid prolonged exposure to ultraviolet rays. Safe use in pregnancy not established.
Precautions: If applied with fingers, wash hands immediately. Apply with care near eyes, nose and mouth. Lesions failing to respond or recurring should be biopsied.
Adverse Reactions: Local—pain, pruritus, hyperpigmentation and burning at application site most frequent; also dermatitis, scarring, soreness and tenderness. Also reported—insomnia, stomatitis, suppuration, scaling, swelling, irritability, medicinal taste, photosensitivity, lacrimation, leukocytosis, thrombocytopenia, toxic granulation and eosinophilia.
Dosage and Administration: Apply sufficient quantity to cover lesion twice daily with nonmetal applicator or suitable glove. Usual duration of therapy is 2 to 4 weeks.
How Supplied: Solution, 10-ml drop dispensers—containing 2% or 5% fluorouracil on a weight/weight basis, compounded with propylene glycol, tris(hydroxymethyl)aminomethane, hydroxypropyl cellulose, parabens (methyl and propyl) and disodium edetate.
Cream, 25-Gm tubes—containing 5% fluorouracil in a vanishing cream base consisting of white petrolatum, stearyl alcohol, propylene glycol, polysorbate 60 and parabens (methyl and propyl).

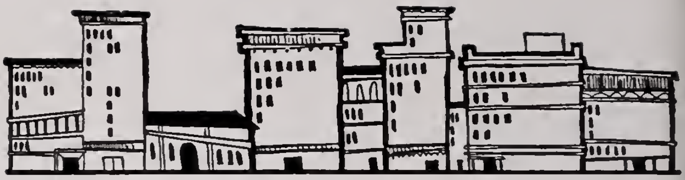
From the Medical Schools



UNIVERSITY OF MISSOURI-COLUMBIA

James O. Davis, M.D., professor and chairman. Department of Physiology, University of Missouri, is one of ten medical educators and researchers who have received 1973 Awards for Distinguished Achievement from *Modern Medicine,* a national medical journal.

Doctor Davis, cited "for proof of the involvement of the kidney in the production of aldosterone," was among more than 200 men and women nominated for the awards, which originated in 1934. Nominations come from U. S. medical school officials, leaders of medical organizations, physician-readers of *Modern Medicine,* and members of the journal's worldwide editorial faculty.

Doctor Davis is chairman of the National Council for High Blood Pressure Research, American Heart Association.

WASHINGTON UNIVERSITY

Edmund V. Cowdry, Ph.D., research professor emeritus of anatomy at Washington University School of Medicine, has been designated a Pioneer in Aging by the Institute of Gerontology, University of Michigan and Wayne State University, Detroit. Doctor Cowdry was one of seven who were recognized for their achievements as scientists and educators in gerontology by the Institute's 25th annual conference on aging.

S. *George Lesinki,* M.D., a resident in otolaryngology at the Washington University Medical Center, was awarded first prize in the basic science competition for awards for research given at the recent annual meeting of the American Academy of Ophthalmology and Otolaryngology in Dallas, Tex. In the clinical science section, second prize was won by Drs. *I. Kaufman Arenberg, John P. Murray, Erol Rauchback* and *Nicholas L. Schenk,* all residents in otolaryngology at the Medical Center. Doctors Lesinki, Arenberg, Murray, Rauchback and Schenk are National Institute of Nervous Diseases and Stroke (NINDS) research fellows.

Two research grants totalling $55,969 have been awarded to scientists in School of Medicine's Department of microbiology.

David Apirion, Ph.D., associate professor of microbiology, has received $24,300 for protein synthesis studies from the National Science Foundation's new Research Applied to National Needs Fund.

The American Cancer Society has granted $31,669 to *David Schlessinger,* Ph.D., professor of microbiology. He will study the effects of cyclic AMP on transformed (abnormally changed) cells.

The Washington University School of Medicine chapter of Alpha Omega Alpha (ΑΩΑ) national medical honor society held its annual initiation banquet on January 24 at Washington University Alumni Center. Sixteen senior medical students, one faculty member and three Medical School alumni were initiated into the society.

Faculty electee was *Walter F. Ballinger,* M.D., Bixby Professor and head of the Department of Surgery. Alumni electees were *Richard W. Hudgens,* M.D., associate professor of psychiatry and assistant dean; *Herbert Lubowitz,* M.D., associate professor of medicine and head of the Division of Nephrology, Jewish Hospital; and *James M. Stokes,* M.D., associate professor of clinical surgery and president, Medical Center Alumni Association.

William H. Danforth, M.D., chancellor of Washington University and professor of medicine, delivered the after-dinner address.

Chapter officers are *Barry* S. *Farber,* president; *David C. Hooper,* vice-president; *Virgil Loeb, Jr.,* M.D., associate professor of clinical medicine, counsellor; and *Jack Barrow,* M.D., instructor in clinical medicine, secretary-treasurer.

ST. LOUIS UNIVERSITY

Dr. Thomas F. Frawley, professor and chairman of the Department of Internal Medicine, St. Louis University School of Medicine, has requested to leave that post on Sept. 1, 1973 to devote full time to teaching, research, patients and writing.

Dr. Robert H. Felix, dean of the School of Medicine, who announced that Doctor Frawley had requested to be relieved of administrative duties, said that he would continue to serve as professor of internal medicine and head of the Section of Endocrinology in the Department of Internal Medicine at the School of Medicine.

In commenting on Doctor Frawley's ten years as chairman of the Department of Internal Medicine, Doctor Felix cited the physician's leadership in organizing and establishing the various sections in the Department of Internal Medicine. These include Arthritis, Cardiology and Pulmonary Diseases, Endocrinology, Hematology, Infectious Diseases, Experimental Medicine, Nutrition and Renal Diseases. He also commended Doctor Frawley's leadership in the American College of Physicians. He holds the office of Governor for Missouri in the College of Physicians.

Rev. Edward J. Drummond, S.J., vice-president for the Medical Center, said, "Doctor Frawley is a noted authority in the field of endocrinology and has made major contributions in the identification of glandular disorders. He also will play a key role in the planning and development of a Special Diagnostic and Treatment Center of the St. Louis Veterans Administration Hospital. This center will be especially supportive of studies on endocrine and metabolic problems relating to alcoholism, drug abuse and aging." The St. Louis Veterans Administration Hospital is affiliated with St. Louis University.

Doctor Frawley is Physician-in-Chief of the St. Louis University Hospitals and a member of the attending staff at St. Mary's Health Center.

Richard L. Stensrud, Jr. became director of the St. Louis University Hospitals on February 1.

In addition to his administrative duties, Mr. Stensrud is instructor in the Graduate School program for Hospital and Health Care Administration at St. Louis University. He joined the University Hospitals as assistant director in 1967 and has served as associate director since 1971. He was assistant administrator at the George Washington University Hospital in Washington, D. C. from 1965 to 1967.

Mr. Stensrud replaces *Ernest N. Boettcher*, M.D., who served as director from 1966 until January of 1973.

The Role of Obstruction and Infection in Biliary Tract Disease

Special Feature

INTRODUCTION

Dr. John Thompson Hodgen, one of the great and good surgeons of St. Louis, died at age 52, now some 91 years ago. His contributions to this community were many. It is a privilege to present in his honor a discussion of the *Role of Obstruction and Infection in Biliary Tract Disease*. This subject was selected because Doctor Hodgen's untimely death was the result of a bile peritonitis as described at a called meeting of this Society.

> "Dr. Baumgarten, who had been chief physician for Dr. Hodgen, was requested to give details of the last illness. He had been summoned on Thursday evening to find his patient in undescribable agony from bilious colic, similar to those he had had periodically for some years. There was a tenderness of the abdomen, a tenderness on pressure; a tenderness below the ribs on the right side. Chloroform did not relieve him and it was necessary to give frequent injections of morphine. He had not improved during the night and after a consultation with Drs. Smith, Gregory and Johnson, leeches were applied to the abdomen which showed evidence of a general peritonitis. The pulse was sinking in volume and increasing in frequency, and the extremities were cold. Bleeding from the leeches was stopped and stimulants applied. In the afternoon the pulse went up to between 120 and 140, and became weak and thready. Several doses of stropia, hypodermically administered, staved off the result for a short time but he sank and toward seven he passed away.
>
> "Dr. Elisha Gregory then gave an account of the postmortem. On opening the abdomen, a diffusion of bile was perceived throughout the cavity. A perforated ulcer of the gallbladder was found and also evidence of general peritonitis."

The history of previous "attacks" and the course of the terminal illness indicate that obstruction and infection were the critical factors leading to death.

CHARCOT'S SYNDROME of intermittent fever, chills and jaundice, published in 1877, is evidence that obstruction and infection were long ago recognized as important factors in biliary tract disease. Their role today is of ever-increasing concern, in part because a greater proportion of our population lives to 65 years and older. Those who have calculous disease of the biliary tract are susceptible to complications. Each may be the cause of biliary tract disease and account for the primary clinical manifestations. However, their roles are somewhat different and more determinate when either or both are superimposed upon an established disease of the biliary tract regardless of its etiology. Because biliary calculi are present in 95% of patients with biliary tract disease, infection or obstruction or both account for complications or major episodes of exacerbation in the clinical course. Sometimes these are fatal.

OBSTRUCTION

The causes of obstruction in biliary tract disease may be grouped under four headings: congenital anomalies, calculi, neoplasia and stricture.

Congenital Anomalies: Atresia of segments of the ductal system, the failure of a lumen to develop, has been estimated to occur once in every 15,000 to 20,000 full-term pregnancies. If these be limited to intrahepatic ducts draining less than half of the liver parenchyma, the jaundice present at birth may clear without clinical evidence of obstruction thereafter. Congenital absence of the intrahepatic ductal system is very rare and usually is not long compatible with life. Occasionally, it is tolerated for months and years. It is not susceptible to remedial surgical measures. Congenital diverticula of the ductal system are most frequent in the common duct but also occur in the intrahepatic system. These diverticula may be the cause of pain and obstruction by compression or distortion or both of the duct proximal to their junction. Duplication of the ductal system and the gallbladder are associated with a high incidence of diminished lumens that cause partial obstruction.

Calculi: Ninety-five percent (95%) of biliary tract disease in North America is associated with calculi. Most of these form in the gallbladder. With the egress of bile from the gallbladder into the common duct, calculi, if small, may cause obstruction within the cystic duct and larger ones may block the cholecystoductal junction. The mechanism of emptying that results in increased pressure within the gallbladder is the common cause of "biliary colic." Persistence of the obstruction is often followed by hydrops of the gallbladder as illustrated by the photograph taken at operation (Fig. 1). Cultures from such specimens are usually reported "no growth." Calculi within the ductal system, other than the gallbladder and cystic duct, may result in obstruction at the distal portion of the common duct although they may become lodged in any segment. Not all calculi cause obstruction; indeed, its occurrence is unpredictable. However, the longer calculi are present within the ductal system, the larger they become, and the greater the age of the individual, the more likely is obstruction, incomplete or total, to occur. Progressive and relatively rapid obstruction in any segment of the ductal system that results in distention proximal to it, is perceived by the patient as pain or a sense of heaviness in the right upper quadrant of the abdomen. Sudden occlusion causes severe pain, whereas insidious occlusion, as sometimes occurs from calcareous material, may cause only an awareness or sense of change and discomfort in the region of the liver.

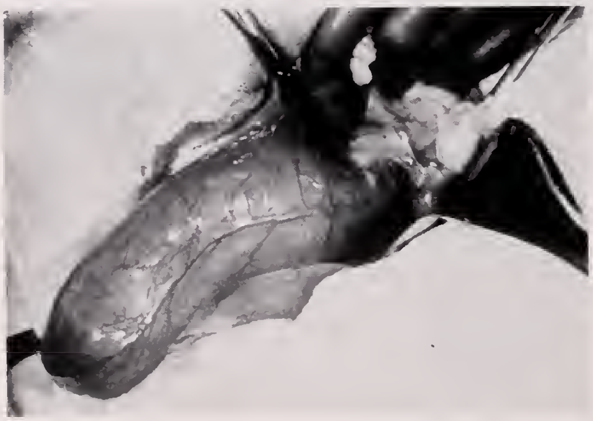

Fig. 1 Obstruction: Acute cholecystitis due to obstruction by a small calculus in the lumen of the cystic duct.

Neoplasia: Progressive obstructive jaundice unassociated with pain is usually caused by a tumor arising in the extrahepatic ductal system. The classical example is the elderly individual, deeply jaundiced, who at operation is found to have a carcinoma in the common duct. Calculi are present in less than 15% of ductal carcinomas. On the other hand, carcinomas of the gallbladder arise in the presence of cholelithiasis in approximately 90% of instances. Calculi may have caused symptoms of an acute obstructive cholecystitis that has recurred. If a tumor develops in such a situation, an episode of acute cholecystitis with failure to subside persists because of the obstruction. Thus, the diagnosis of carcinoma of the gallbladder is seldom established before operation, and that being done for "an acute cholecystitis." Carcinoma of the gallbladder tends to metastasize to the lymphatics of the common hepatic duct and cause obstruction with jaundice. The difference between obstruction due to carcinoma in the gallbladder containing calculi and that occurring in the rest of the ductal system without calculi is significant. Those with long-standing calculous disease often have infection.

Stricture: The entire biliary ductal system is subject to changes that are due to an increase in the thickness of the wall with a narrowing of the lumen. The process may be a diffuse and generalized one or it may be limited to one or several segments. The term "sclerosing choledochitis" has been used to describe it. The cause is unknown; there is no established relationship with calculous disease. The degree of obstruction is dependent upon the extent of the narrowing of the lumen. The onset is insidious; the manifestation of obstruction is dependent upon the degree of jaundice present. Although usually becoming more pronounced, it may fluctuate to recede and increase over weeks or months. With rare exception, the mural lesion is the primary cause of obstruction. Because it is slowly progressive, symptoms and disability are much less than when obstruction takes place quickly, as may occur with a calculus in the distal portion of the common duct.

Small cell carcinoma may produce a segmental involvement that grossly is indistinguishable. The diagnosis is unequivocally established by microscopic demonstration of malignant cells. These tumors are slow in growth and extension but have a poor prognosis. Those patients with sclerosing choledochitis are less predictable. Although they have a reduced life expectancy, they have a better prognosis.

There are other types of ductal obstruction generally labeled iatrogenic. These are directly related to trauma and operations on the biliary tract undertaken for biliary tract disease. An interference with the blood supply may result in an ischemia within the wall of the common duct followed by stricture formation as scar tissue replaces the normal distensible duct wall. This is a rare occurrence. More commonly, the duct is injured during operation by partial or complete surgical transection or occlusion by ligature. When the continuity of the ductal system is interrupted, be it planned for resection as in a Whipple procedure or unintentionally in the performance of a cholecystectomy, the probability that obstruction will occur later in life is considerable regardless of the type of repair.

The diameter of the lumen at the site of anastomosis tends to be reduced in time by scar tissue, regardless of the method employed to restore continuity. Even when a segment of the proximal common duct is implanted through the wall of the duodenum or jejunum into the lumen with no sutures near the site of transection, the terminal lumen gradually becomes greatly reduced within a matter of months. The degree of this stricture formation varies from individual to individual and is unpredictable. Biliary cirrhosis results from obstruction of the ductal system. The microscopic picture of liver changes are typical.

The chief characteristics in comparison to the normal liver are as follows:

(1) There is an increase in the fibroplastic proliferation; the collagen formation is between the lobules of the liver.

(2) There are small areas of liver regeneration. These vary according to the nature of the obstruction. If it has been slow and gradual and of long-standing, they are more marked than if there has been sudden and complete obstruction of short duration.

(3) There is a decrease in the interlobular bile ducts. Perhaps it is more accurate to say that they are less evident due to reduction of their lumen by the fibroplastic changes that have taken place in the tissue about them.

(4) And, finally, there is a change in the liver cell itself. This varies from patient to patient, varying in different age groups and duration and nature of the obstruction.

The process of biliary cirrhosis is irreversible. Improved function may occur with regeneration of liver tissue.

MISSOURI MEDICINE is proud to present this transcript of the 47th Hodgen Lecture which was sponsored by the St. Louis Surgical Society and presented by Doctor Glenn at the St. Louis Medical Society on March 2, 1971. Doctor Glenn, who is the Lewis Atterbury Stimson Professor of Surgery Emeritus of Cornell University Medical College, graduated from Washington University School of Medicine in 1927. His contributions to the teaching of surgery have been outstanding. His areas of investigation and publications have been extremely broad and include cardiac, vascular, endocrine, traumatic and gastrointestinal surgery. As a result of his investigation, teaching and tremendous clinical experience, Doctor Glenn is well known for his contributions to surgery of the biliary tract.

INFECTION

An extensive and comprehensive literature relative to the bacterial flora of bile indicates that most every organism commonly found in the gastrointestinal tract has been cultured from bile. In normal individuals, the bacterial count is low. Those with systemic disease, such as diabetes, advanced atherosclerosis, infections with bacteremia and the aged with marked disability, have higher bacterial counts in their bile. The bacteria most frequently cultured are: E. coli, Streptococcus fecalis, Enterobacter aerogenes, Pseudomonus aerogenes, Proteus vulgaris and

Fig. 2

Streptocococcus viridans (Fig. 2). There are several mechanisms for bacteria to enter and grow in bile: (1) They pass through the liver from the blood and are excreted into the canaliculi; (2) the lymphatics infected directly from intra-abdominal organs or the blood stream liberate bacteria into the ductal system; (3) bacteria from the blood stream infect the wall of the gallbladder and bile ducts; and (4) ascending infection through the ampulla of Vater from the duodenum. G. B. Ong (1962) in a study of recurrent pyogenic cholangitis reported its production experimentally by constriction of the common duct followed by introduction of E. coli into the portal vein.

Clinically, bacterial infection of the biliary tract occurs in all decades of life. It exacts highest toll in the very young and the elderly. Cholecystitis in infants and children is almost invariably associated with a bacteremia.

The primary site of the infection may be any place within the body, e.g., middle ear infections, pneumonia and intra-abdominal abscesses, such as those resulting from appendicitis. Typhoid fever, now uncommon, illustrates the mechanism whereby infection causes biliary tract disease, as an acute cholecystitis. If the attack subsides and the gallbladder remains, there may be persistence of typhoid bacilli in the bile throughout life without causing symptoms, as was the case in "Typhoid Mary." The bacteremia increases the organisms to such numbers in the bile that as they are concentrated in the gallbladder, the organisms are not overcome by the ordinary bactericidal properties of the bile. Invasion of the gallbladder mucosa results in a flagrant infection with impairment of the blood flow to produce an ischemia and, sometimes, necrosis with gangrene. Even cholecystectomy under these circumstances for the acalculous acute cholecystitis may be followed by a persistent residuum of typhoid bacilli throughout the biliary tract.

Calculous biliary tract disease in the very young is infrequent, occurring chiefly in those with hemolytic anemia. Occasional case reports of infants and children with biliary calculi associated with metabolic disorders have been reported in recent years.

Another and, indeed, spectacular example of infection that may occur without calculi is "pneumocholecystitis." Although acute emphysematous cholecystitis was described by Lobingier in 1908, relatively few patients have been reported when one recognizes that calculous biliary tract disease is the condition for which abdominal operations are most frequently done. Some 150 cases have been reported. Although cultures are often negative, it is believed to be caused by microorganisms capable of gas production. Amongst 1,389 patients operated on for acute cholecystitis, we have encountered this condition only four times. In one of these, the findings at operation were subsiding acute cholecystitis with a pneumocholecystitis (Fig. 3). Clostridia organisms were found. The patient had an uneventful recovery. When seen one and one half years later, he was doing well.

Diverticula of the ductal system, intra- or extrahepatic, may become a "focus" for bacterial growth that extends to produce a cholangitis. Duodenal diverticula which originate at or adjacent to the ampulla of Vater may be the site of infection. This may extend into the biliary ductal system and, with obstruction, cause a bacteremia most often of gram-negative organisms.

Ecchinococcus Cyst: Hepatic abscesses secondary to ecchinococcus infection may rupture into the intrahepatic biliary ductal system and be the cause of cholangitis and jaundice. The slide illustrates an ecchinococcus cyst and abscess that ruptured into the left major hepatic duct. Daughter cysts passed into the common bile duct to cause obstruction.

One of the complications of peptic ulcer is the formation of a fistula between the ulcer bearing segment of the gastrointestinal tract and the common bile duct. Ascending infection may cause symptoms referable to the liver.

An example of a choledochoduodenal fistula is demonstrated by a gastrointestinal series. Opaque material outlines the fistula and common bile duct. Air is present in the intrahepatic ductal system.

Extrahepatic infections of an extensive nature with a bacteremia are a cause of clinical jaundice. Diagnosis may be difficult. Vermillion and his associates at the Mayo Clinic reported seven

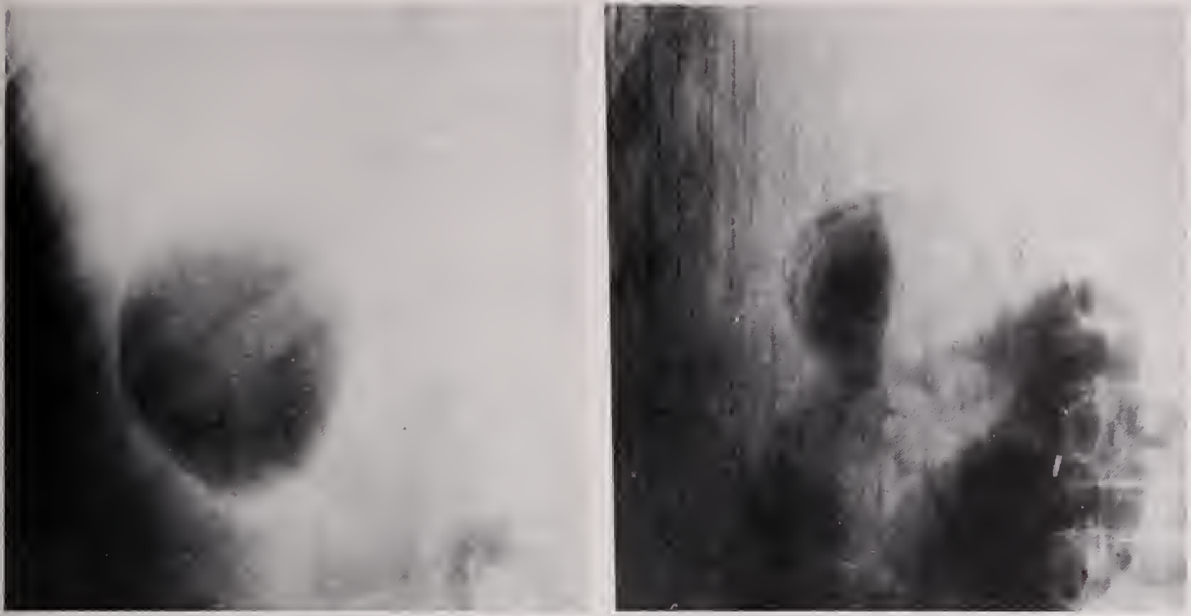

Fig. 3 Infection: Pneumocholecystitis without calculi. Gas producing organisms were cultured.

patients with jaundice due to an overwhelming infection. Three had peritonitis, two had advanced blood dyscrasias, one had a bacterial endocarditis and one had a leukemic infiltration of the liver and changes attributed to mercaptopurine therapy.

The predominant bacteria identified by blood culture were (1) Bacteroides, (2) Streptococcus (anaerobic), (3) Staphylococcus aureus, (4) Streptococcus (anaerobic), (5) Pseudomonas, (6) Pseudomonas and (7) Staphylococcus aureus.

Their observations are specific:

> "Bacteremia was due to various gram-positive and gram-negative organisms, one patient having mixed flora. Pathologic hepatic changes were principally those of cholestasis, Kupffer cell hyperplasia, fatty metamorphosis, and focal necrosis of parenchymal cells; in most patients, these changes were thought to represent nonspecific reactive hepatitis. In all patients, autopsy or surgical exploration demonstrated a normal biliary tract with no gross pathologic process involving the liver. Six of the seven died of the underlying illness and associated bacteremia. In the one survivor, the results of hepatic function tests became normal."

The clinician should be alert to diagnose and establish the cause of jaundice.

Cholangitis is a common accompaniment of infection within the biliary ductal system. For the simple cholangitis, the following three manifestations are criteria for the diagnosis:

(1) The wall of the duct is thickened.
(2) There is an infiltration of the polymorphonuclear leucocytes into the paraductal tissues.
(3) The cellular anatomy is less distinct than in the normal, being described as "cloudy swelling."

In addition to these changes, bile stasis with pigmentation is not infrequent.

Cholangitis is an infection of the biliary ductal system. Involvement of the intrahepatic portion including the small ramifications, the canaliculi, also involves the adjacent liver cells. Acute cholangitis of short duration may subside with little residual effect upon the liver tissue. This low power photomicrograph demonstrates intense infiltration of the centrally located portal area with polymorphonuclear leucocytes. Note that the leucocytes have infiltrated the portal bile ducts and the surrounding portal connective tissue as well. There is but little bile retention, however, and no demonstrable hepato-cellular necrosis or hepatic cirrhosis.

Obstruction and Infection

The terms "acute" and "chronic" cholecystitis are indicative of the nature of the inflammatory reaction present rather than the stage of the disease. The gallbladder that has contained calculi for a short time usually functions well, whereas function is poor when calculi have long been present. Impairment of function as demonstrated by cholecystography is relatively readily correlated with the degree of disease in the gallbladder wall. Some of the reaction and scarring, if not most of it, is the result of bacterial injury. If there have been episodes with ascending infection via the lymphatics, then a low grade cholangitis may be present. Bacteria in the bile as secreted by the cells of the liver into the canaliculi probably plays a minor role in early calculous disease whereas the bacteria within the wall of the gallbladder and bile ducts plays a major role. One may readily imagine that such an established infection may "flare up" when the protective mechanisms against these bacteria are reduced or when local conditions change. Distention of the gallbladder or ductal system or both by whatever cause may result in circumstances favorable to bacterial growth. Such increased growth in the canaliculi becomes a source of organisms to be poured back into the blood stream and, at the same time, prevent bile from being received from the liver cells, thus producing jaundice of varying degree as well as a bacteremia.

Acute Calculous Cholecysitis: The normal bacterial flora of the bile of individuals in good health may vary from individual to individual. Bile is bacteriocidal for many of these. The gram-negative organisms are the most numerous. When calculi form in the gallbladder, they probably have little effect upon the bacterial flora. However when the calculi obstruct the flow of bile into or outflow of the gallbladder or both, stasis results. Under these circumstances, the bacteria rapidly increase in number. A gallbladder outlet obstructed by a calculus attempts to overcome the obstruction by increasing the pressure within it. This causes pain and, at the same time, tends to force the bacteria into the interstices of the gallbladder wall, the Rokitansky-Aschoff sinuses, where they produce a cellulitis and intramural abscesses. This is infection in the true sense of the word precipitated by obstruction that leads to stasis of bile in the gallbladder. Infection, thus once established, extends into the lymphatics of the ductal system, both intra- and extrahepatic. To what extent infection persists after such an episode is conjectural. Recurrent episodes may be expected. There is little doubt that even after removal of an acutely inflamed gallbladder containing calculi, episodes of cholangitis may occur. In the young, with gallstones of short-standing, this is less frequent than in the older individual in whom calculous disease has long been present.

The role of obstruction and infection in acute cholecystitis is well presented in a recent study of 28 cases by J. F. Watson. Obstruction is held to be the more frequent primary cause of acute cholecystitis. In the elderly and debilitated, infection is secondary. However, infection and obstruction account for the morbidity of serious complications and the majority of the deaths.

Choledocholithiasis—Acute Obstructive Suppurative Cholangitis: Chronic cholecystitis, as mentioned above, is associated with calculi in most instances. The duration of the disease, the robustness of the patient or individual, whether or not the calculi are increasing in number or size or both, determines to a large extent whether the bacterial infection in the biliary tract remains relatively quiescent or tends to exacerbate from time to time.

Dow and Lindenauer at the University of Michigan Medical Center in Ann Arbor reviewed the reports on acute suppurative cholangitis in 1969 adding their own experience of ten patients. Running through this report is emphasis upon the parallelism of the experience of the various clinics, namely, biliary tract disease of long-standing is usually in the individuals of the older age group, although there were a few cases in patients under 50. The mechanism of common duct obstruction resulted in a septicemia of a rather specific pattern. They exhibited hypotension, mental obtundation, septicemia due to gram-negative organisms. The prognosis is grave. Operation is mandatory. Decompression which is accomplished by a procedure that is within the patient's capacity offers the most.

Note that the use of antibiotics prior to operation, in my opinion, is mandatory. The reason for this statement is the high incidence of the organisms in the blood stream in large numbers and, second, that any surgical procedure is likely to increase the bacteremia. It is probable, also, that the bacteremia is the cause of the manifestations of the infection rather than the growth of the organisms within the liver itself. In other words, the problem lies with the bacteria in the blood stream rather than the bacteria that are limited to the liver and ductal system. The obstruction results in the rapid pouring forth of these organisms into the circulation. On the basis of this concept, one may hypothecate that an elderly person, who has tolerated calculi and infection within the biliary system for many years, may suddenly become devastated when a calculus in the common duct suddenly occludes the flow of bile and infection becomes uncontrolled. The presence of many organisms, stasis, a lack of protection against the bacterial toxins set the stage for flagrant bacterial growth. The nature of the organisms vary greatly. At Duke University, bacteriological studies of bile obtained by percutaneous transhepatic aspiration illustrated 64% of 70 patients with intrinsic obstruction due to ordinary biliary tract disease. Colon bacilli were the predominating organisms. They emphasize that whereas 64% of patients with obstruction gave positive bile cultures, only 10% of patients with complete obstruction secondary to carcinoma of the pancreas or ampulla of Vater gave positive cultures. They pointed out that an unknown percentage of patients with chronic gallbladder disease have clostridia in the gallbladder wall. However, only rare instances of clostridia gas gangrene follow operations on the gallbladder. The gram-negative group, as they flourish, produce an overwhelming toxic material within the ductal system that is passed into the circulation producing shock. The organisms from the large bowel, the colon, reach the liver, for the most part, through the portal circulation and in large numbers. The septicemia that these produce account for a considerable proportion of the deaths due to biliary tract disease. So rapid may be the development of this process that death may occur before it is recognized and indicated therapy instituted. This is illustrated by the findings at operation in an elderly man with acute obstructive suppurative cholangitis. The contracted, thick-walled gallbladder contained calculi. Choledocholithiasis caused complete common duct obstruction. A bacteremia ensued.

The combination of obstruction and infection are more frequently the cause of biliary enteric fistulae than infection alone. In a sense, they represent a favorable outcome of acute cholecystitis with impaired integrity of the gallbladder wall that might have resulted in a fatal bile peritonitis. Cholecystoduodenal fistulae are the most common followed by cholecysto-colonic in incidence. Communications between the gallbladder and stomach are rare.

An example of an unusual situation is presented on the slide, an instance of cutaneous-cholecysto-colonic fistula. Infection and obstruction account for its persistence.

The end result of long-standing obstruction and infection of the ductal system is evident in the slide. Intrahepatic calculi and cholangitis first impair liver function, then cause loss of substance in some segments with biliary cirrhosis in others. Regeneration of liver tissue is minimal because of the persistence of obstruction and infection. The autopsy specimen attest to the lethal effect of these factors in biliary tract disease (Fig. 4).

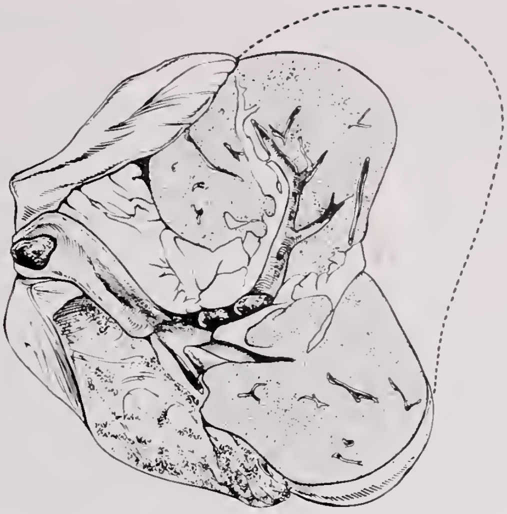

Fig. 4 Obstruction and Infection: End result of long-standing obstruction and infection. Calculi in the intrahepatic ductal system and advanced cirrhosis led to liver failure and death.

Prolonged obstruction and infection of the biliary ductal system leads to an intense change in the liver tissue about the canaliculi. There is a marked increase in the fibroplastic tissue and collagen material in this area. In addition, there may be all degrees of inflammatory reaction from that of a simple cholangitis to a true hepatitis and even miliary abscess formation. In the wake of these, scarring and cirrhosis follow. There is a marked loss in the normal architecture of liver tissue. Liver regeneration is often present, particularly if the process has been of long-standing.

Chronic Cholestasis With Early Hepatic Cirrhosis: In contrast to the photomicrograph of acute cholangitis, the hepatic parenchyma is divided by linear bands of connective tissue which extend between portal areas. Other significant differences are that in chronic cholestasis intercanicular bile, retention is quite apparent and that the inflammatory infiltrate which is composed of lymphocytes and plasma cells is not confined to the portal areas but extends out along the cirrhotic bands of connective tissue as well.

Discussion

Separately, the role of obstruction and infection may be observed by the study of selected cases. From a practical standpoint, the two occur together as a general rule. Either may precede the other in the beginning of the disease and, in that sense, be considered an etiological factor. Once established for long, obstruction and infection appear to vie with one another in furthering the advance of the disease.

Obstruction without infection manifests itself in two ways. First and most obvious is jaundice. If the onset of obstruction is sudden and if it is complete, jaundice quickly becomes intense. If the obstruction is only partial and gradually increases, then the jaundice is insidious and may escape notice for considerable time. Second is the matter of pain. Sudden occlusion of the common duct by a calculus is evidenced by pain in the right upper quadrant and mid-epigastrium that radiates through to the back and scapular area. Unrelieved, complete obstruction results in jaundice that is apparent within 12 hours. If the obstruction is incomplete, such as takes place when a tumor arising within the common duct is the cause, pain may be minimal or absent even when the obstruction becomes complete. Pain followed by jaundice indicates sudden and marked obstruction. The matter of diagnosis is not difficult whereas jaundice that has been gradual in onset but progressive with little or no pain requires the consideration of many possibilities.

The microscopic picture of a liver biopsy in the patient with obstruction without infection ranges from canicular distention with increased bile pigment in the liver cells to the extensive scarring of biliary cirrhosis.

The effects of infection are more numerous, more variable and less predictable than those of obstruction. The bacterial flora of bile in a state of health differs from one individual to another. Actual bacterial counts may be low or high without infection. In the presence of calculi and the injury they may produce to the mucosal surface of the biliary tract and obstruction to the flow of bile, bacteria increase to cause "infection." The microscopic changes due to infection depend upon the extent and duration of the process. Acute cholangitis of short duration subsides with little residual effect upon the liver tissue. If persistent or recurrent with flagrant exacerbations of a virulent nature, liver damage is great and scarring, cirrhosis, with reduced liver function results. Individuals in the robust period of life appear to be less susceptible to such infections than those at the extremes of life. Amongst infants, young children and the elderly, debilitating infections within the biliary tract tend to progress and extend rapidly. In the very young, the infection usually reaches the biliary tract from some focus elsewhere in the body. Such flagrant infections are today rarely fatal, being controlled by antibiotics and support of the body's protective mechanisms. In the elderly, a long existing bacterial flora in the bile of organisms from the intestinal tract may suddenly assume exuberant growth and cause a gram-negative septicemia, one of the more common causes of death in elderly patients with long-standing calculous biliary tract disease.

In the broad sense, the treatment of biliary tract disease consists in the prevention and control of the two principal forces that cause disability and curtail life. Essentially, these are obstruction and infection in the biliary ductal system. Because calculi so often precede these, the prevention of calculi would seem to be the ideal approach. The accomplishment of this objective remains for some time in the future. Thus for the present, we are limited to the prevention and control of the complications that are due to obstruction and infection. The initial phase of the disease is calculi in the gallbladder, cholelithiasis. The early recognition of their presence and the undelayed removal of the gallbladder is the most effectual means to this end at present. This has been well-established and is widely documented in the medical literature. It also is well known that the clinical course of a patient with cholelithiasis is unpredictable. Autopsy studies have demonstrated that many individuals have gallstones whose histories do not indicate that they have ever caused symptoms and whose liver exhibits no demonstrable pathologic changes that can be attributed to them. Upon these observations, there are many physicians who advocate ignoring cholelithiasis unless they cause disability. Such a policy is extended to withhold operation unless these disabilities are intolerable or constitute an immediate threat to life.

The accumulated experience of representative surgical clinics in North America, as well as those of many countries throughout the world, provide a considerable evidence that early sur-

IMPORTANT INFORMATION: *This is a Schedule V substance by Federal law; diphenoxylate HCl is chemically related to meperidine. In case of overdosage or individual hypersensitivity, reactions similar to those after meperidine or morphine overdosage may occur; treatment is similar to that for meperidine or morphine intoxication (prolonged and careful monitoring). Respiratory depression may recur in spite of an initial response to Nalline® (nalorphine HCl) or may be evidenced as late as 30 hours after ingestion. LOMOTIL IS NOT AN INNOCUOUS DRUG AND DOSAGE RECOMMENDATIONS SHOULD BE STRICTLY ADHERED TO, ESPECIALLY IN CHILDREN THIS MEDICATION SHOULD BE KEPT OUT OF REACH OF CHILDREN.*

Indications: Lomotil is effective as adjunctive therapy in the management of diarrhea.

Contraindications: In children less than 2 years, due to the decreased safety margin in younger age groups, and in patients who are jaundiced or hypersensitive to diphenoxylate HCl or atropine.

Warnings: Use with caution in young children, because of variable response, and with extreme caution in patients with cirrhosis and other advanced hepatic disease or abnormal liver function tests, because of possible hepatic coma. Diphenoxylate HCl may potentiate the action of barbiturates, tranquilizers and alcohol. In theory, the concurrent use with monoamine oxidase inhibitors could precipitate hypertensive crisis.

Usage in pregnancy: Weigh the potential benefits against possible risks before using during pregnancy, lactation or in women of childbearing age. Diphenoxylate HCl and atropine are secreted in the breast milk of nursing mothers.

Precautions: Addiction (dependency) to dipl
late HCl is theoretically possible at high dosa
not exceed recommended dosages. Administ
caution to patients receiving addicting dr
known to be addiction prone or having a his
drug abuse. The subtherapeutic amount of a

Many things can cause diarrhea.
LOMOTIL® will almost surely stop it.
Telegram

The causes of diarrhea are as varied as man's complaints and indiscretions. Because the causes of diarrhea can be obscure and because uncontrolled diarrhea can present serious problems, it is important to know a drug that will usually stop diarrhea promptly. For many physicians, the antidiarrheal drug of choice is Lomotil. It provides almost certain control of diarrhea.

It is also useful in controlling the intestinal transit time of patients with ileostomies and colostomies and the diarrhea occurring after gastric surgery.

Serious side effects are infrequent with Lomotil. It should be used with caution in young children, however, because of their variability in response. Use of Lomotil in children under two years of age is contraindicated.

For the almost certain control of diarrhea,

LOMOTIL®

TABLETS/LIQUID

Each tablet and each 5 ml. of liquid contain:
Diphenoxylate hydrochloride ...... 2.5 mg.

v as one fourth of the initial dosage. Make down-
rd dosage adjustment as soon as initial symptoms
e controlled.
erdosage: Keep the medication out of the reach
children since accidental overdosage may cause
vere, even fatal, respiratory depression. Signs of
erdosage include flushing, lethargy or coma, hypo-
nic reflexes, nystagmus, pinpoint pupils, tachy-
rdia and respiratory depression which may occur 12 to 30 hours after overdose. Evacuate stomach by lavage, establish a patent airway and, when necessary, assist respiration mechanically. Use a narcotic antagonist in severe respiratory depression. Observation should extend over at least 48 hours.

Dosage forms: Tablets, 2.5 mg. of diphenoxylate HCl with 0.025 mg. of atropine sulfate. *Liquid,* 2.5 mg. of diphenoxylate HCl and 0.025 mg. of atropine sulfate per 5 ml. A plastic dropper calibrated in increments of ½ ml. (total capacity, 2 ml.) accompanies each 2-oz. bottle of Lomotil liquid.

Dosage forms: Tablets, 2.5 mg. of diphenoxylate HCl with 0.025 mg. of atropine sulfate. *Liquid,* 2.5 mg. of diphenoxylate HCl and 0.025 mg. of atropine sulfate per 5 ml. A plastic dropper calibrated in increments of ½ ml. (total capacity, 2 ml.) accompanies each 2-oz. bottle of Lomotil liquid.

Who knows what evil lurks in the mucous membranes?

Trademark Ornade® knows.

Each Spansule® (brand of sustained release capsule) contains 8 mg. of Teldrin® (brand of chlorpheniramine maleate); 50 mg. of phenylpropanolamine hydrochloride; and 2.5 mg. of isopropamide, as the iodide.

Knows the public's enemies—nasal congestion, runny nose, sneezing, watery eyes.

Knows what to do about them too.

All through the dark night of upper respiratory difficulty, while ordinary cold remedies wear off, the decongestant, antihistamine, and drying agent in 'Ornade' fight the never-ending battle for comfort, symptomatic relief, and free airways.

Ornade®. Why not let it help fight your patient's cold war.

Before prescribing, see complete prescribing information in SK&F literature or *PDR*.
Indications: Upper respiratory congestion and hypersecretion associated with: the common cold; acute and chronic sinusitis; vasomotor rhinitis; allergic rhinitis (hay fever, "rose fever," etc.).
Contraindications: Hypersensitivity to any component; concurrent MAO inhibitor therapy; severe hypertension; bronchial asthma; coronary artery disease; stenosing peptic ulcer; pyloroduodenal or bladder neck obstruction. Children under 6.
Warnings: Caution patients about activities requiring alertness (e.g., operating vehicles or machinery). Warn patients of possible additive effects with alcohol and other CNS depressants.
Usage in Pregnancy: In pregnancy, nursing mothers and women who might bear children, weigh potential benefits against hazards. Inhibition of lactation may occur.
Effect on PBI Determination and I^{131} *Uptake:* Isopropamide iodide may alter PBI test results and will suppress I^{131} uptake. Substitute thyroid tests unaffected by exogenous iodides.
Precautions: Use cautiously in persons with cardiovascular disease, glaucoma, prostatic hypertrophy, hyperthyroidism.
Adverse Reactions: Drowsiness, excessive dryness of nose, throat or mouth; nervousness; or insomnia. Also, nausea, vomiting, epigastric distress, diarrhea, rash, dizziness, weakness, chest tightness, angina pain, abdominal pain, irritability, palpitation, headache, incoordination, tremor, dysuria, difficulty in urination, thrombocytopenia, leukopenia, convulsions, hypertension, hypotension, anorexia, constipation, visual disturbances, iodine toxicity (acne, parotitis).
Supplied: Bottles of 50 capsules.

Duplication of the Common Bile Duct

Case Report

This case report of duplication of the common bile duct depicts the embryological basis for the abnormality. The author also includes a review of the literature. Doctor Casebolt is in the private practice of surgery.

ANOMALOUS ANATOMIC RELATIONSHIPS are found frequently in the extrahepatic ductal system and associated hepatic and cystic arteries. Text books of anatomy are misleading, suggesting constancy of anatomy in this area. Eisendrath[1] reported anomalous bile ducts in 8% of the series of necropsies; Michels[2] found accessory ducts in 18% of 200 specimens. Abnormal course of the cystic duct is a common occurrence and is reported by Flint[3] to exist in 15% of his series of 200 cases. Thompson[4] found a similar abnormal course in the cystic duct in 23% of 421 specimens. The incidence of significant deviation from normal anatomy could be estimated at 30%.

The frequency of procedures involving the gallbladder and bile ducts requires the surgeon to be familiar with abnormal anatomy. Failure to recognize unusual anatomic relationships at operation could result in surgical injury to the vital structures encountered when performing cholecystectomy and common duct exploration.

Duplication of the common bile duct is one of the rare abnormalities of the extra-hepatic ductal system. Duplication of the common bile duct, like other anomalies, has an embryological basis, which will be reviewed.

CASE REPORT

The patient was a 69-year-old white woman who was admitted to the hospital with a history of chills, fever and vomiting of several weeks' duration. The patient denied abdominal pain. She acknowledged pain localized to the inferior angle of the right scapula. While hospitalized, a spiking fever was evident. Initial investigation revealed a number of problems. Auricular fibrillation was converted to a sinus rhythm with digitalis; chronic pulmonary emphysema, chronic bronchitis and pulmonary fibrosis were detected; and a severe anemia was identified. An upper gastrointestinal series was normal. A needle biopsy of the liver showed slight focal, chronic hepatitis. Several urinalyses revealed pyuria. Urine cultures revealed miscellaneous organisms, with an organism count less than 10,000 per cu mm. An intravenous pyelogram failed to reveal obstructive uropathy to account for the patient's suspected sepsis. A cholecystogram revealed a nonfunctioning gallbladder. An intravenous cholangiogram revealed a dilated common bile duct with several filling defects indicative of common duct stones. An SMA-12 determination revealed the serum albumin to be only 2 gm/100 ml, and there was slight elevation of the alkaline phosphatase.

The patient was treated with antibiotics to which she slowly responded with subsidence of fever and leukocytosis. Slight tenderness became apparent in the right upper quadrant of the abdomen. It seemed increasingly evident that the cause of the patient's suspected sepsis was cholangitis due to common duct stones.

At surgery, the patient had multiple stones in her gallbladder. The gallbladder wall was thickened and subacutely inflamed. The spleen was five to six times enlarged and estimated to weigh 600 gm to 800 gm. The common bile duct was filled with stones and its wall felt thickened. A cholecystectomy was first performed. A cystic duct cholangiogram (Fig. 1) confirmed the presence of common duct stones. A choledochotomy was performed, and multiple stones were extracted from the common bile duct. When the opened common bile duct with the stones removed was viewed from within, there appeared to be a posterior diverticulum, which also contained stones. The stones filling this diverticulum were removed with difficulty. The exact nature and full extent of this anatomical abnormality could not be appreciated at the time of surgery by intraoperative cholangiography because of superimposition of the common bile duct and the "diverticulum." An intraoperative post-common-duct exploration T-tube cholangiogram (Fig. 2) revealed no further stones. A liver biopsy was performed.

Postoperatively, the pathologist reported chronic cholecystitis with cholelithiasis. There was polyarteritis involving the wall of the gallbladder, which was described as striking. The liver biopsy showed slight chronic hepatitis. The common duct stones were noted.

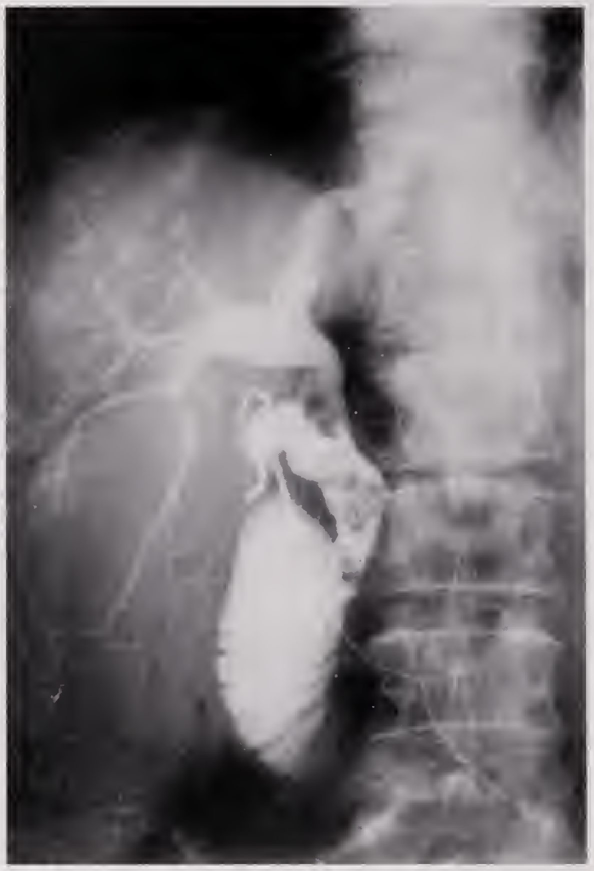

Fig. 1 Precommon duct exploration intraoperative cystic duct cholangiogram. The common duct duplication was not evident at this time since the two ducts were superimposed. However, stones in both ducts are apparent.

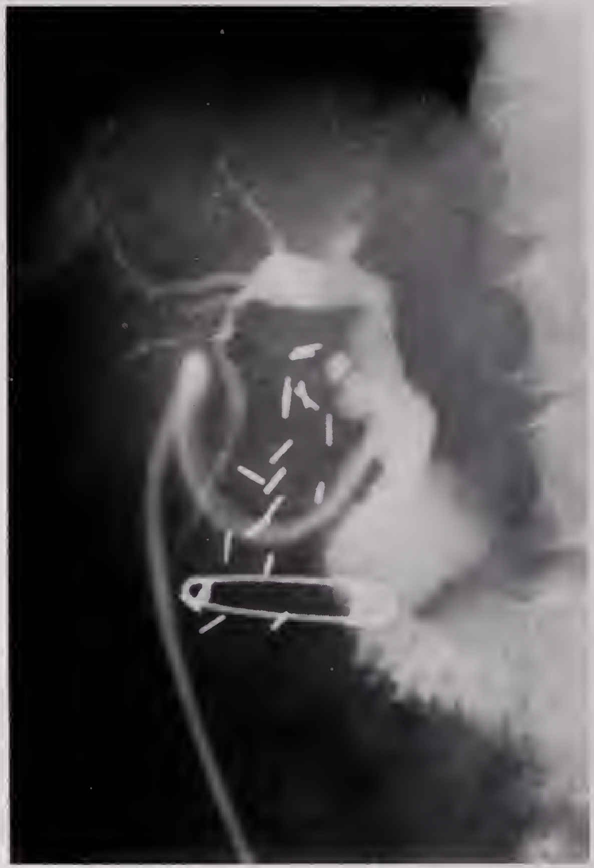

Fig. 2 Intraoperative T-tube cholangiogram following exploration of the common bile duct revealing no further stones.

The patient continued to have a low grade fever and exhibited leukocytosis on an obscure basis. Postoperative antibiotics were administered. The first T-tube cholangiograms were obtained on the eighth postoperative day. These failed to rule out residual stones. Oblique and lateral views revealed duplication of the common bile duct (Fig. 3), rather than the previously suspected diverticulum. The artist's concept of the abnormal anatomy (Fig. 4) is based on intraoperative recollections and the postoperative cholangiogram. Two additional later T-tube cholangiograms revealed no residual stones. The T-tube was removed on the 22nd postoperative day without sequella.

After postoperative antibiotics failed to control low grade fever and leukocytosis, the patient was started on a regimen of corticoids as definitive treatment for polyarteritis. She exhibited a symptomatic response with diminution of the low grade temperature elevation and a reversion of leukocytosis to normal. The patient was somewhat improved and dismissed from the hospital on the 26th postoperative day.

The patient has not done well following hospital dismissal. A low grade fever persists. Anorexia continues and arthralgia is present. There has been no weight gain and the patient appears cachectic. It is the general belief of her physicians that she has progressive, widely-disseminated polyarteritis, which probably has a poor prognosis. Larger dosages of corticoids are currently being employed in an attempt to produce a remission.

Discussion

In reviewing the case presentation, it is apparent that the patient was fortunate to have had all stones removed from both ducts. This is particularly true in view of the limited access to the more posterior of the two ducts and in view of the initially misunderstood abnormal anatomy.

It also is apparent that this patient's bile duct problem may not be completely solved. Bile stasis will occur in the more posterior of the two bile ducts, which could lead to formation of additional common duct stones. This is especially true since the upper portion of the more posterior duct is a blind stump (Fig. 3). It was here that the cystic duct was tied and divided at what

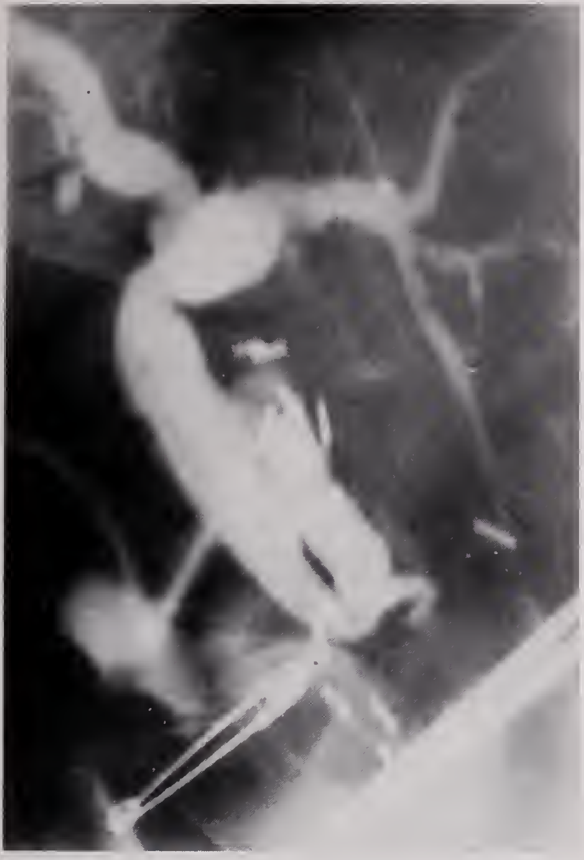

Fig. 3 Oblique postoperative T-tube cholangiogram revealing duplication of the common bile duct. Note the communication between the two ducts.

was believed to be its junction with the common bile duct.

On a hypothetical basis, it is interesting to speculate about what could be done in the future should additional common duct stones develop in this patient. One good solution might be to divide the common hepatic duct as low as possible, anastomosing it to the duodenum. This procedure might have been done initially had the abnormal anatomy been thoroughly understood.

From the practical point of view, it seems doubtful that this patient's longevity will be sufficient to permit development of stone formation because of her disseminated polyarteritis.

It appears increasingly apparent that most of this patient's past and present problems are best accounted for by disseminated polyarteritis rather than common duct stones and cholangitis.

Embryology of Biliary Duct System

In the two-week-old human embryo (2.5 mm), the hepatic diverticulum is a median ventral outgrowth of the entodermal tube. By five weeks of age (4.5 mm), the hepatic diverticulum, which at first is a hollow cul de sac-like protrusion, divides into a cranial or pars hepatica portion and a caudal or pars cystica portion (Fig. 5).[5] The cranial portion is the anlage of the epithelial lining of the right, left and common hepatic ducts and intrahepatic ducts. The caudal portion is the precursor of the epithelial lining of the gallbladder, the common bile duct and the cystic duct. The common bile duct is of short length in comparison to the other portions of the ductal system in the five-week embryo (Fig. 5).

The gallbladder, the common bile duct, and the cystic duct are originally solid cords of cells without lumina. The common bile duct has a lumen in the 7.5 mm embryo. The lumen of the cystic duct develops by the time the embryo reaches 16 mm. A clear cut lumen of the gallbladder begins to appear in the 18 mm embryo. Development of the gallbladder wall with mucosa and muscularis does not occur until the embryo reaches 29 mm in length. Viewing Ludwig's sketch[5] (Fig. 5), it is easy to appreciate how a number of different types of duplication of the common bile duct could evolve.

Embryologically stated, this case of common duct duplication evolved as a result of the fol-

lowing: an incomplete division of the pars cystica and pars hepatica; a failure of growth at the root of the hepatic diverticulum, destined to become the common bile duct; and excessive growth of the pars hepatica and pars cystica portions, destined to become the common hepatic and cystic ducts.

Review of Literature

Duplication of the common bile duct or double drainage is a rare abnormality. Only a few cases have been reported in the world literature. Boyden[6] in 1933 collected 19 case reports of congenital doubling of the common bile duct from the world medical literature, dating back as far as the 1500s. Five of these cases had abnormal enteric insertions. Mentzer[7] cited similarities between the anatomy of fish, birds and reptiles and the cases of duplication of the common bile duct collected by Boyden.[6]

Fig. 6 Diagrammatic summation of the cases of duplication of the common bile duct reported in the world literature (after Goor and Ebert).

A diagrammatic summation (Fig. 6) of all reported cases of duplication of the common bile duct has been compiled by Goor and Ebert.[8] These authors divided the reported cases into four main groups: septum in the common duct (Fig. F-1); bifid common duct (Fig. F-2); conditions in which the left lobe of the liver drains into the pyloris or duodenum via one duct and the right lobe drains via another duct (Figs. F-3, F-4B, F-5); and conditions in which both right and left hepatic ducts drain through a common hepatic duct into the duodenum. The gallbladder drains separately into the duodenum through a cystic duct. A communicating duct or ducts join this double drainage arrangement (Figs. F-6 and F-7).

The case reported represents a combination of a septum in the common duct and a communicating channel between the two ducts (Figs. F-1 & F-6).

Summary

A case of duplication of the common bile duct has been presented. An artist's concept of the abnormal anatomy with reproductions of cholangiograms document the presentation.

The embryologic basis for this rare abnormal-

Unilateral Exophthalmos

The diversity of the etiology of unilateral exophthalmos presents a diagnostic challenge requiring multidisciplinary evaluation. It not only involves the ophthalmologist, but may require the attention of the radiologist and internist, the pediatrician, the generalist, the otolaryngologist and, on occasion, the neurosurgeon. The authors report a representative survey of patients with this condition who have been examined in the past ten years. Doctor Ide is Professor of Ophthalmology and Doctor Hart is Professor and Chairman of the Department of Ophthalmology, University of Missouri. Doctor Jung, former Chief Resident Physician, is now in private practice in Cape Girardeau. Doctor Jarudi, former Chief Resident Physician, is now in private practice in Beirut, Lebanon.

In every patient with unilateral exophthalmos, it is mandatory to differentiate true exophthalmos from pseudoexophthalmos, a condition seen in patients with unilateral high myopia, unilateral buphthalmos, unilateral retraction of the upper lid and congenital or traumatic asymmetry of the orbit.[1]

Definition and Measurement of Exophthalmos

Unilateral exophthalmos may be defined as the protrusion of one globe and is synonymous with proptosis. It may be best appreciated by viewing the eyes from above and behind the patient. Several devices are available for objective measurement of exophthalmos. The most commonly used instrument is, perhaps, the Hertel exophthalmometer.[2] It consists of a calibrated guide bar, which is placed horizontally in front of the patient's eyes, and a carrier at each end of the bar. The carrier has a sliding sleeve which contains a reflecting 45-degree prism and is notched to fit the temporal margin of the orbit. The distance between the temporal margin of the orbit and the apex of the cornea viewed from the side is measured. A difference of 2.5 mm or greater between the eyes is significant.[3]

History

The history may reveal the etiology. When did the proptosis first become noticeable? How fast is it developing? A sudden onset of unilateral exophthalmos usually indicates an inflammatory process (Fig. 1), while an insidious onset may indicate a neoplasm (Fig. 2). A history of trauma makes one consider an arteriovenous fistula with its associated bruit and pulsation (Fig. 3). Double vision may be the initial symptom prior to the actual development of gross proptosis. Another initial symptom may be the

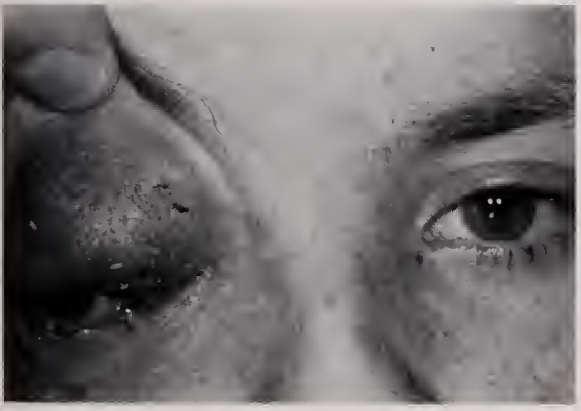

Fig. 1 Orbital cellulitis causing exophthalmos on the right side with downward displacement of the globe.

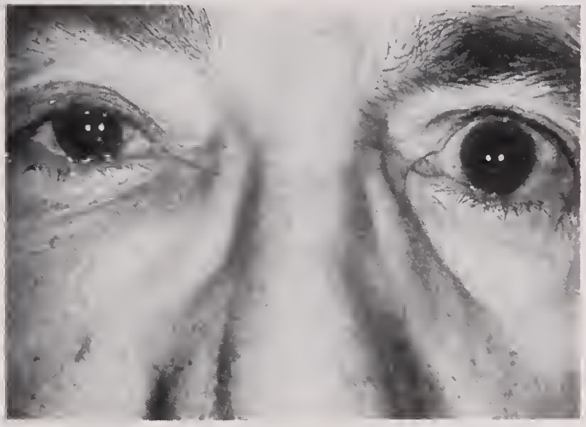

Fig. 2 Right exophthalmos due to a malignant lymphoma of the maxillary sinus with tumor extension into the orbit.

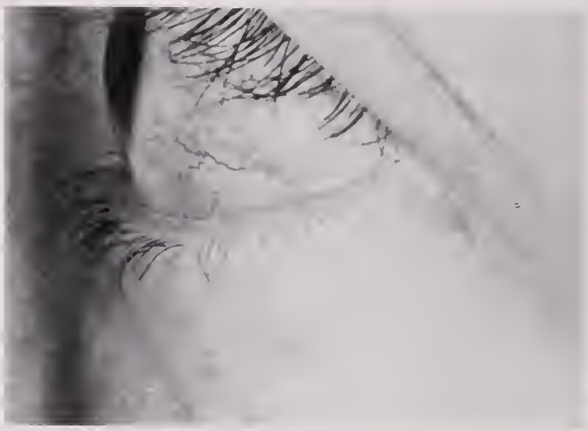

Fig. 3 Exophthalmos and prominent conjunctival vessels in a patient with arterio-venous malformation in the left orbit.

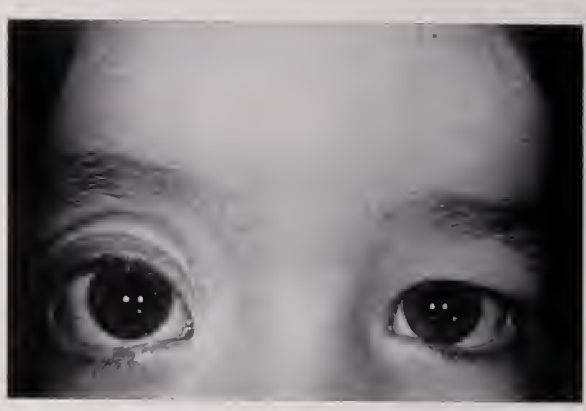

Fig. 4 Hemangioma in the right orbit causing marked exophthalmos.

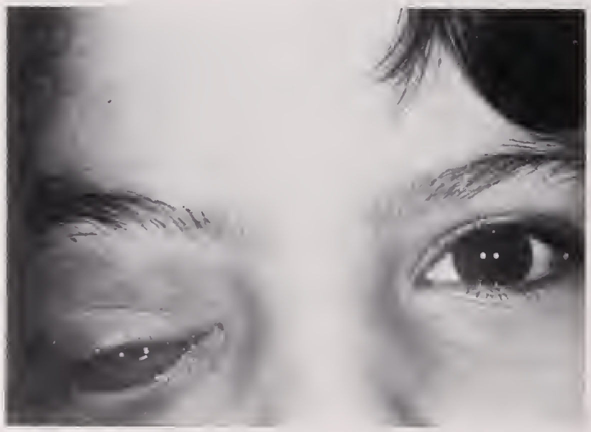

Fig. 5 Swelling of right upper lid and forward and downward displacement of the globe in a patient with orbital rhabdomyosarcoma.

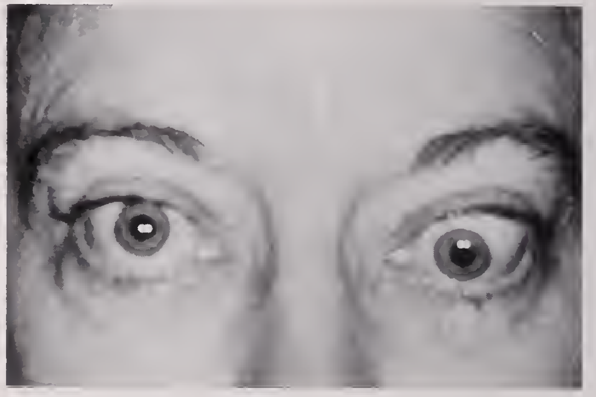

Fig. 6 Left exophthalmos and paralysis of left superior rectus muscle in a patient with thyroid disease.

rubbing of lashes against the spectacle lens.

Some orbital tumors are a frequent cause of exophthalmos in a certain age group but are extremely rare in another. Hemangiomas are the most common of all orbital tumors and usually occur in childhood or early adult life (Fig. 4).[4] A rhabdomyosarcoma is the most frequent malignant orbital neoplasm in childhood. It may tend to bleed easily and follow a rapidly progressive course as in the case of the girl who presented with ecchymosis and proptosis of the right eye (Fig. 5).

Complaints of nasal discharge, chronic sinusitis or previous sinus surgery may be elicited in patients with an orbital mucocele. The accessory sinuses of the nose surround the orbit, being separated from it by thin bony walls. If an orifice connecting a sinus with the nose becomes occluded, the sinus will become distended with fluid (mucocele). A mucocele of the frontal or ethmoidal sinus may cause swelling of the upper and nasal part of the orbit with proptosis of the globe downward and laterally.

Careful questioning for symptoms of hyperthyroidism is pertinent in every case of unilateral exophthalmos. Endocrine disorder secondary to a dysfunction of the thyroid-pituitary axis is a frequent cause of unilateral exopthalmos. One patient with unilateral exophthalmos revealed lid retraction, lid lag, diplopia, restricted ocular motility and positive thyroid function tests (Fig. 6).

PHYSICAL EXAMINATION

A complete ophthalmological examination must be performed. After recording the visual acuity, the first consideration is the measurement of the degree of exophthalmos. The direction of displacement of the globe may help in determining the location of the pathology. Depending upon the site of a tumor, the globe may be displaced upwards, downwards, laterally or nasally as well as anteriorly. A tumor in the muscle cone also may cause pressure on the optic nerve or increased venous pressure which leads to papilledema, visual field defects and optic atrophy.

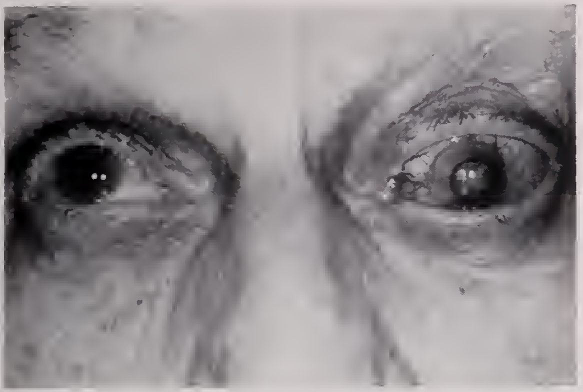

Fig. 7 Malignant melanoma of the orbit, originating in the choroid causing forward and downward displacement of the left eye.

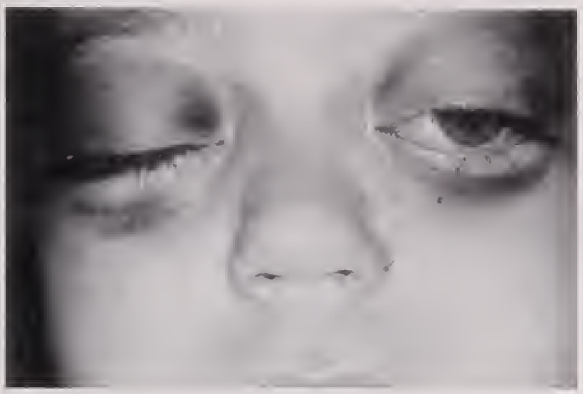

Fig. 8 Metastatic neuroblastoma in the left orbit.

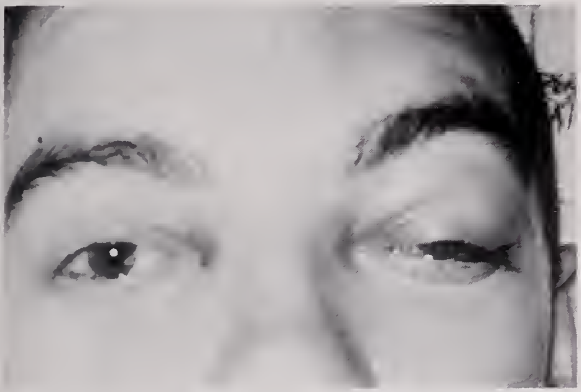

Fig. 9 Left cavernous sinus thrombosis causing exophthalmos.

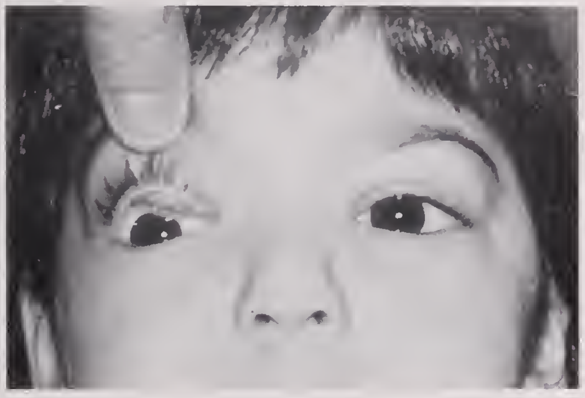

Fig. 10 Right exophthalmos in a patient with acute leukemia.

Folds in the retina may indicate pressure on the posterior part of the globe. An intraocular tumor, a malignant melanoma of the choroid extending into the orbit, was the cause of exophthalmos in this patient (Fig. 7). There was no light perception in the left eye. Examination showed forward and downward displacement of the left globe with marked limitation of its motility. The conjunctival and episcleral vessels were moderately engorged. Hyphema, rubeosis iridis and a mature cataract were evident. Ocular tension was three times as high as the normal value.

Systemic Evaluation

A complete systemic evaluation should include a consultation with the internist when endocrine, hematological, neoplastic or neurological disease is suspected. In children (Fig. 8), neuroblastoma tumor is frequently metastatic to the orbit.[5] Periorbital ecchymoses usually precede the proptosis. The tumors may arise from the adrenal gland or the retroperitoneal ganglia.

Cavernous sinus thrombosis developed first in the left, later in the right sinus of a young man (Fig. 9). He was admitted with high fever, headache of recent onset, proptosis of the left eye and inability to move it in any direction. He was seen in consultation with a neurologist and treated with antibiotics and anticoagulants. He recovered completely.

The ENT consultation should include special attention to the nose, paranasal sinuses, nasopharynx and neck. A cancer of the maxillary sinus invaded the orbit causing unilateral exophthalmos in another patient (Fig. 2).

Laboratory Studies

Laboratory tests for the work-up of patients with unilateral exophthalmos include a complete blood count and, if indicated, thyroid function tests. Evaluation of the routine complete blood cell count led to the diagnosis of leukemia in a child who presented with a stony hard mass below the superior orbital rim (Fig. 10). Abnormal blast cells were seen in the peripheral smear. Bone marrow studies confirmed the diagnosis of acute leukemia with possible infiltration of the right orbit.

Radiographic Examination

In the presence of exophthalmos, an adequate X-ray survey should be taken.[6] The films must include a postero-anterior roentgenogram in nose-chin position (Waters view), a lateral roentgenogram and roentgenograms of the superior orbital fissures and optic canals. Tomograms are often useful in equivocal X-ray findings.

Special Procedures

Angiography and infrared thermography can be valuable tools in delineating the boundaries of pathological vascular orbital processes.[7]

Biopsy

A biopsy should be performed if it is determined preoperatively that knowledge of tissue diagnosis is imperative. If an exploratory biopsy is done, one should be prepared to carry the operation to a conclusion.[8]

Summary

A survey of patients with unilateral exophthalmos who were examined in the Department of Ophthalmology, University of Missouri is given. The often difficult diagnostic problems make a multidisciplinary evaluation mandatory in many cases.

Obstetrical and Gynecological Uses of Ultrasonography at St. Luke's Hospital

Ultrasonography represents a mode by which a more complete evaluation of patients can be made and, in many instances, has been found to be prognostic as well as diagnostic. Although it is applicable to nearly all phases of medicine, it is of special value in obstetrics because of the absence of radiation to mother and fetus. In this paper, the authors limit their discussion to the obstetrical-gynecological applications of ultrasonography. Doctor Betts is a Resident in Obstetrics and Doctor Newman is Director of Obstetrics/Gynecology Education at St. Luke's Hospital. This work was supported by St. Luke's Hospital Foundation for Medical Education and Research.

Since the introduction of ultrasonography in the Obstetrics-Gynecology Department at St. Luke's Hospital in June, 1970, 368 scans have been done. Of these, 37 have been on gynecological patients and 333 on obstetrical patients. A list of uses is shown in Table 1.

All scans in this series were done by using the Picker Model 102-Option 03 Laminograph with Model 102-04 Portoscan and Manual traversing table. Along with the laminograph, an attached Polaroid camera is mounted for permanent recording of all scans. For orientation in the photoscan to be shown, the symphysis will be to the right of the picture with the abdominal wall to the top, unless otherwise stated. In all scans, an attempt is made to fill the urinary bladder to be used as a fixed point of reference.

The majority of our scans have been done to establish fetal weight and growth patterns. It has been shown that the fetal skull increases by 1.5 mm to 1.8 mm per week. With this as a series of scans, a growth pattern may be observed as seen in Figs. 1 and 2.

Cephalometry for fetal size is done by using the B mode of the laminograph, which is a two-dimensional representation of a plane running 90 degrees to the sagittal plane of the fetal skull. This is then converted by means of a grid scale to a biparietal diameter as seen in Fig. 3. The determination of a biparietal diameter of the infant's head is assured only if the midline blip is observed. Cause for the midline blip is unknown, although several theories have been proposed. However, this will not be discussed.

Most workers[1, 2] doing ultrasonographic scanning for fetal size have established their own

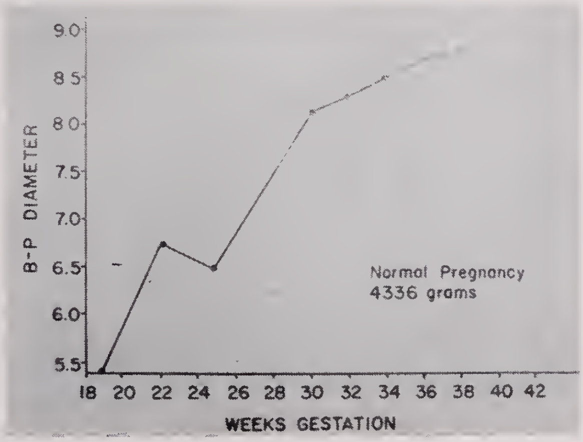

Fig. 1 Normal progression except for a reading at 22 weeks, which was felt to be of questionable value at the time of scanning. This shows a normal sloping curve tapering off after approximately the 34th week of pregnancy. The infant was born at 38 weeks weighing 4,300 gm.

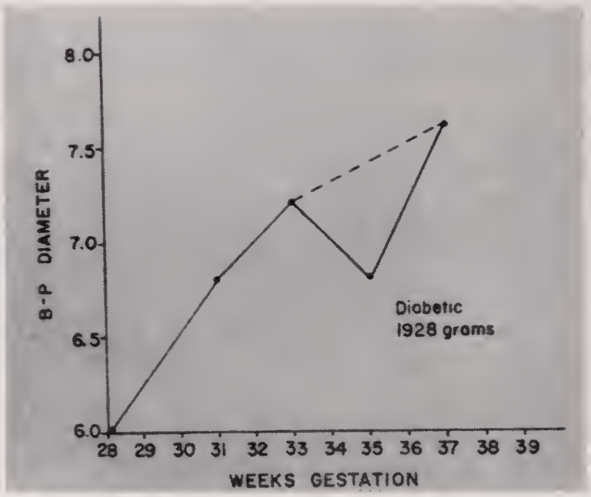

Fig. 2 The growth curve of a severe juvenile diabetic, 26 years of age, Gravida 6 Para 0. This graph shows a normal progression except at 35 weeks which was felt to be an obvious erroneous reading. The dotted line is an interpolation of the curve. This baby weighed only 1,900 gm and was estimated to weigh in the range of 2,500 gm. This was felt to represent a dysmature infant. (Weight determinations in diabetes have been shown to be almost routine underestimates, except in this particular case.)

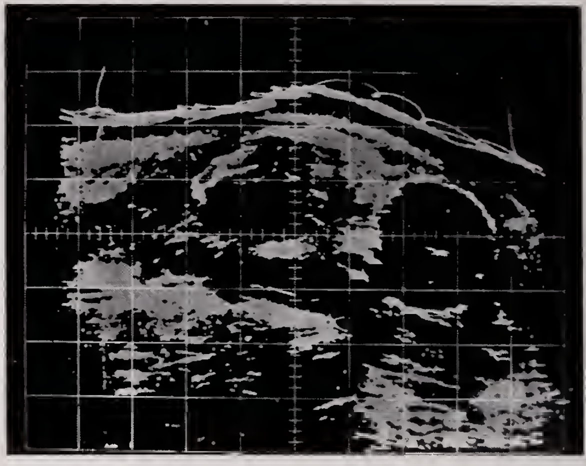

Fig. 3 The round outline of the head can be noted to the right center of the picture with the midline blip lying midway between the anterior and posterior table of the fetal skull.

conversion scale for biparietal diameter to weight, and we have established ours. Thompson and Makowski[3] (Fig. 4) show a straight line graph as weight increases and the biparietal diameter increases. A scattergram showing significant variation is seen in our series of patients (Fig. 5). An average of our determinations in fetal weight at the different biparietal diameters is seen in Fig. 6. The graph includes all values since our initial experience, including the diabetic. As can be seen readily, any similarity between this and the straight line relation is purely coincidental. However, we feel that this typifies the errors of learning. Our scans in the past few months have shown promise of following a more linear progression.

From our experience with cephalometry and weight estimations, we have been able to set some valuable and useful standards. We feel safe in stating from our experience that we can expect 100% of infants with a biparietal diameter of 7.7 cm or greater to weigh more than 2,200 gm, 98% of infants with a biparietal diameter of 8.5 cm or greater to weigh 2,900 gm and 95% of those with an 8.0 cm or greater biparietal diameter to weigh 2,500 gm or more.

Vaginal bleeding early in pregnancy always seems to cause much concern as to the status of

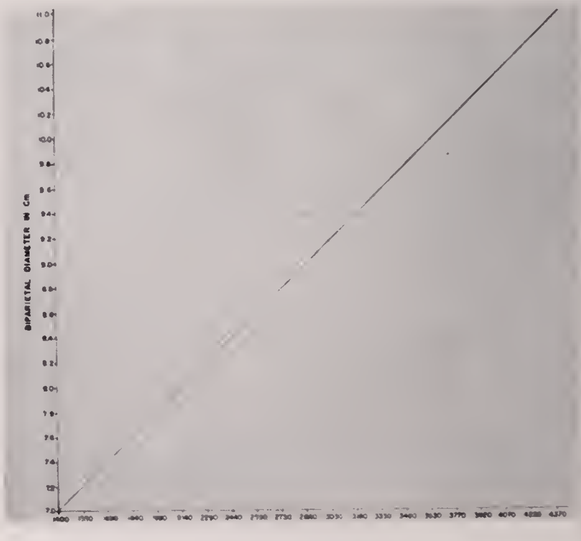

Fig. 4 Fetal weight in G. Estimation of fetal weight by biparietal diameter.

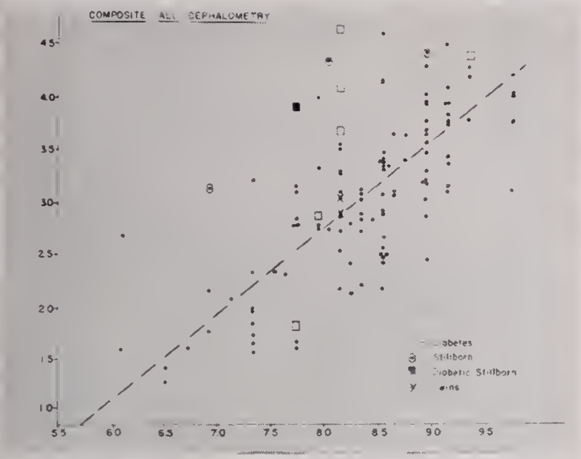

Fig. 5 Many of the marked variants on the high side are diabetics or stillbirth. The diabetics seem to set a scale of their own which appears to be 700 to 1,000 gm heavier than normal. Stillborn infants are probably in an elevated range because of fluid absorption following death.[3]

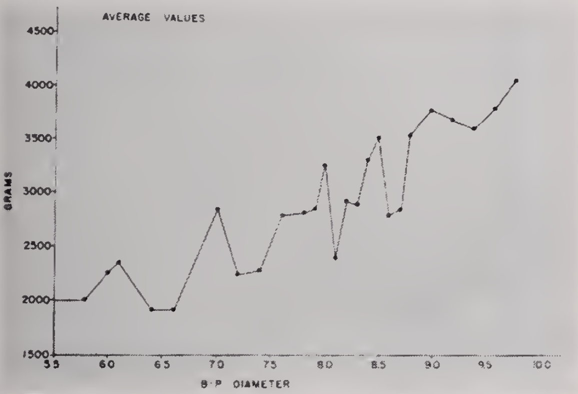

Fig. 6 Average variations in weight and different biparietal diameters.

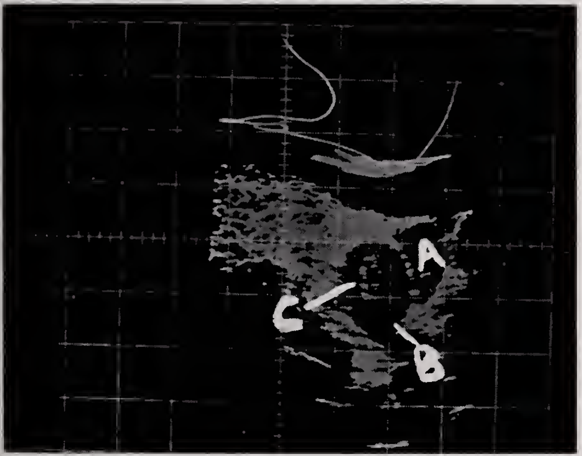

Fig. 7 Early pregnancy at six weeks from the last menstrual period. (A) bladder, (B) uterus, (C) products of conception.

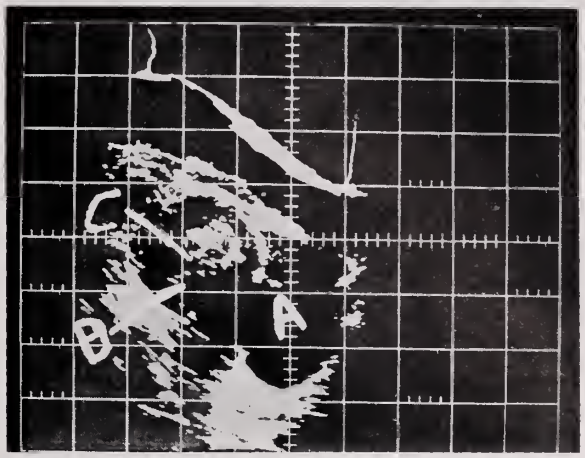

Fig. 8 Early pregnancy at seven weeks from the last menstrual period. (A) bladder, (B) uterus, (C) products of conception.

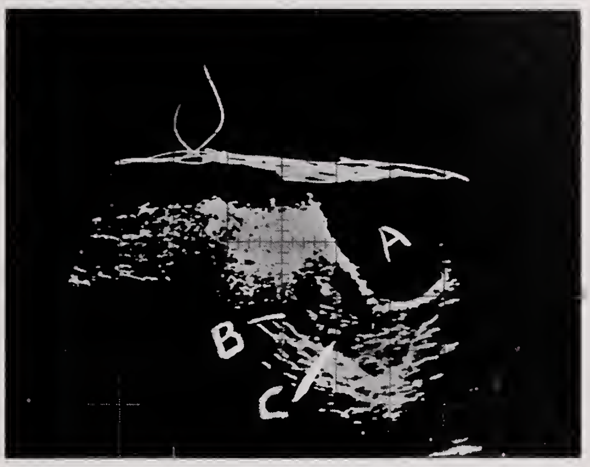

Fig. 9 The products of conception are seen well down into the uterine cavity near the internal os. (A) bladder, (B) uterus, (C) products of conception. (This woman did spontaneously abort approximately eight hours following the diagnosis of inevitable abortion by scan.)

the pregnancy at the present time. With our scan, we have been able to show several things of significant value to use in this particular situation (Figs. 7 & 8). Both Figs. 7 and 8 show high placement of the products of conception, or fetal sac, indicating an intact pregnancy vs what we interpret as an inevitable abortion, even though our definition disagrees with the classic textbook description[4] (Fig. 9). Diagnosis of incomplete vs complete abortion also can be shown by means of ultrasound scanning (Figs. 10 & 11). The final use in this group of patients is the early confirmation of the presence of an abnormal pregnancy in the form of a molar pregnancy (Fig. 12).

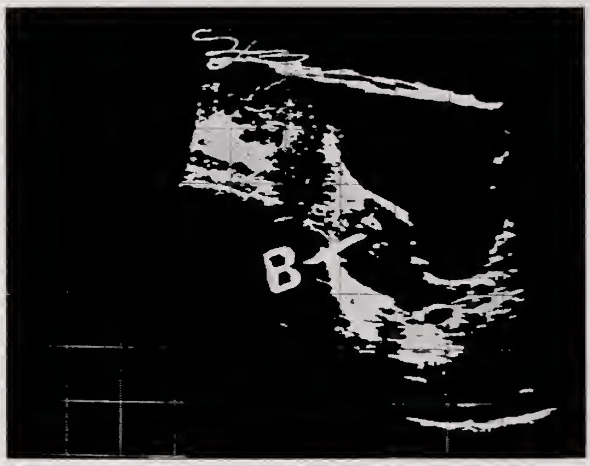

Fig. 10 The uterus is noted to be nearly empty. However, intrauterine blip (B) indicated retained products as were confirmed on suction curettage.

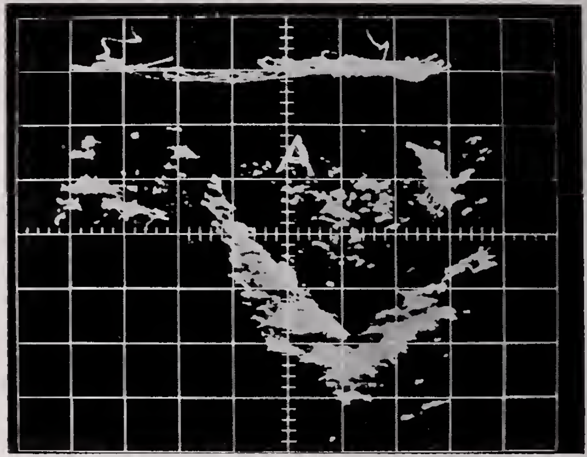

Fig. 12 The bladder is not well outlined with the large area being the uterine cavity (A). The rather flocked, mottled appearance is that of a molar pregnancy as was confirmed in suction curettage.

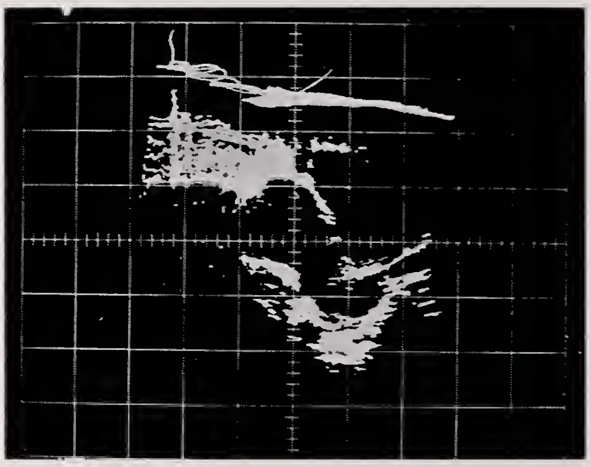

Fig. 11 The uterine cavity is noted to be completely free of any tissue as indicated by the absence of blips. This, too, was confirmed at the time of suction curettage.

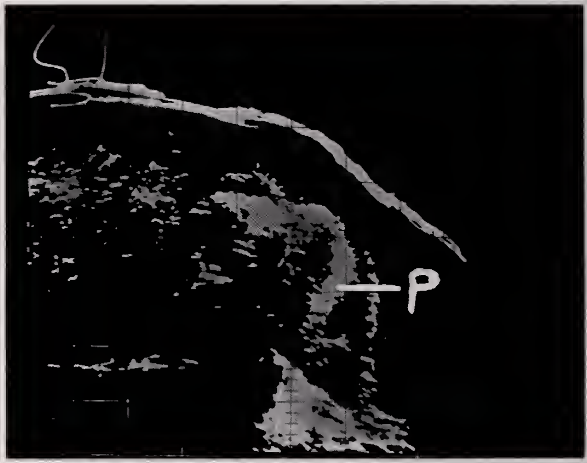

Fig. 13 The placenta (P) is noted to come from the anterior surface and then across the lower portion of the uterus and the cervical os. This was a placenta praevia as was confirmed on double set-up and cesarean section. (Neither fetal skull nor the bladder are well represented in this picture.)

Vaginal bleeding late in pregnancy is of much more concern because of the therapy which may be necessary. The presence of a placenta praevia can be readily determined by means of ultra sound scanning because of the consistent appearance of the placenta. In most cases, the confirmation of placement of the placenta will not alter the course of treatment. However, in our opinion, ultrasonography represents a more accurate means of determining placental localization than by radiographic methods (Fig. 13).

Multiple gestations have appeared to be much easier to diagnose very early in pregnancy rather than later. This is probably on the basis of the difficulty encountered in obtaining both fetal skulls on the same scan (Fig. 14).

A rapidly enlarging uterus can represent much confusion. It can be caused by multiple pregnancies, hydramnios or an associated pelvic mass. These can be readily separated by means of ultrasonography (Fig. 15).

The detection and confirmation of fetal death may be confirmed in many different ways. The loss of fetal heart tone, as determined by the use of Doptone, is probably the easiest and most accurate method. However, findings do become readily apparent on scan early following fetal death. These have been shown to occur much more rapidly than those detected by x-ray (Fig. 16).

Gynecologic applications of the ultrasound scanning is more of confirmatory value than of true diagnostic value. The presence of pelvic tumors may be confirmed quite readily by means

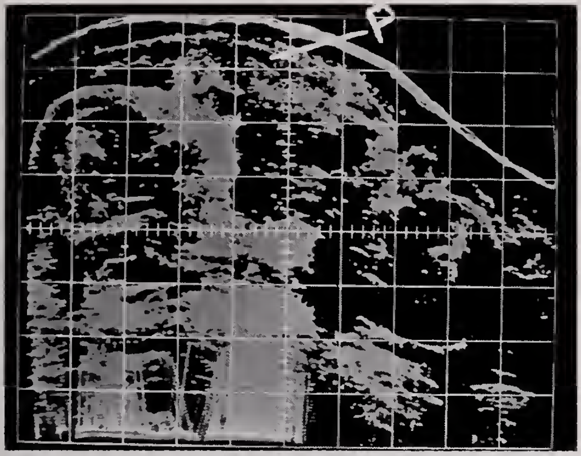

Fig. 14 Set of twins at 34 weeks gestation with the outline of the head noted to the right and to the left of the scan. The placenta (P) is well outlined anteriorly.

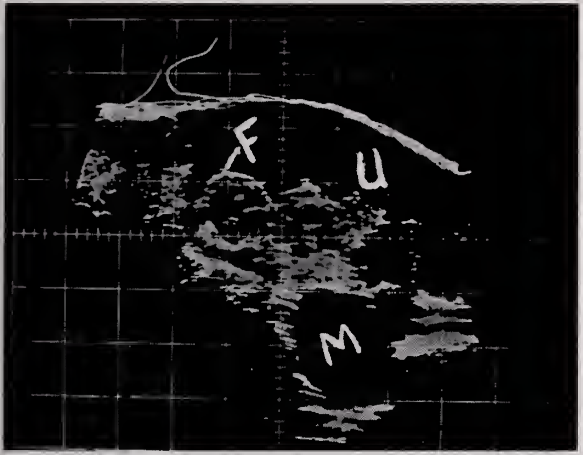

Fig. 15 This is an early pregnancy of approximately 18 weeks in which the uterus (U) and fetal skull (F) outline are seen above a cystic mass (M). This was a large ovarian cyst as was confirmed at laparotomy during the pregnancy.

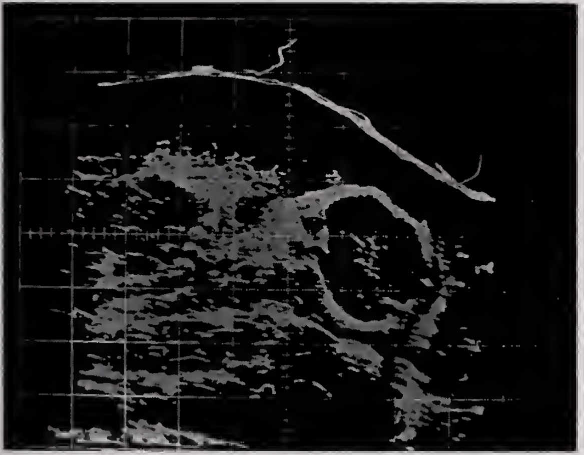

Fig. 16 The above patient had lost the sensation of fetal motion approximately 72 hours prior to the scan and fetal heart tones were not heard at the time of the examination. Note the rather oblong appearance of the fetal skull outlined with the loss of a definite midline blip indicating fetal demise and the rapid loss of tissue consistency.

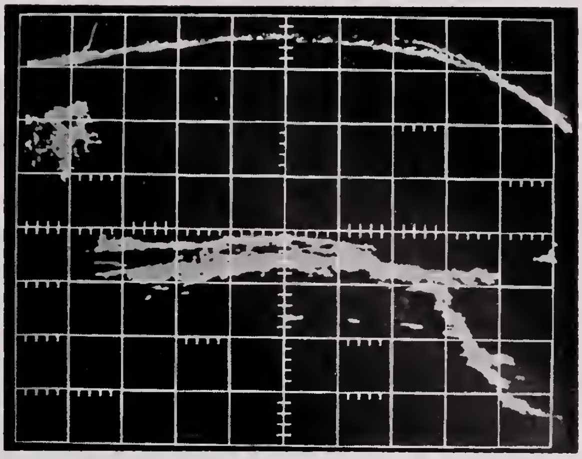

Fig. 17 A sagittal scan of an extremely large cystic tumor of the ovary in a 14-year-old girl. Note the absence of blips within the space indicating a cystic nature.

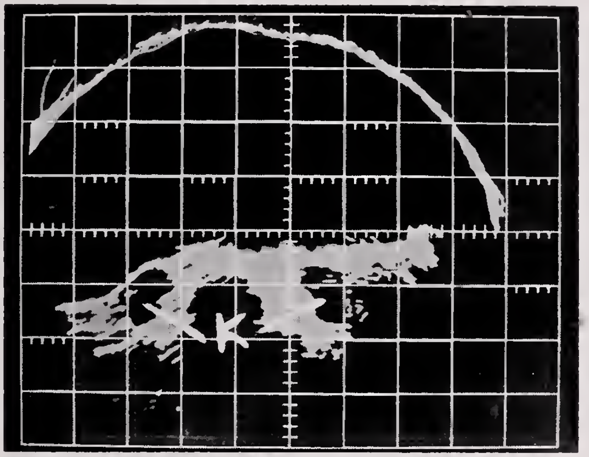

Fig. 18 A transverse scan of the same mass above the level of the umbilicus showing lateral excursion. Also noted posteriorly are scans of the lower poles of both kidneys (K). At surgery, this was found to be a large cystoma of the ovary.

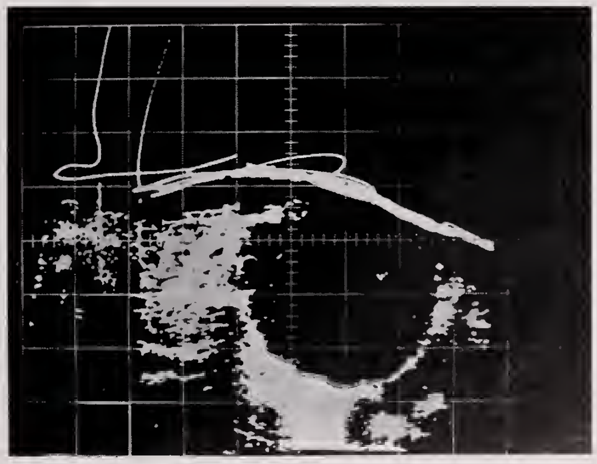

Fig. 19 A 46-year-old woman with a pelvic mass felt to be ovarian. Note the relatively smooth outline of the cyst giving the impression of a benign tumor.

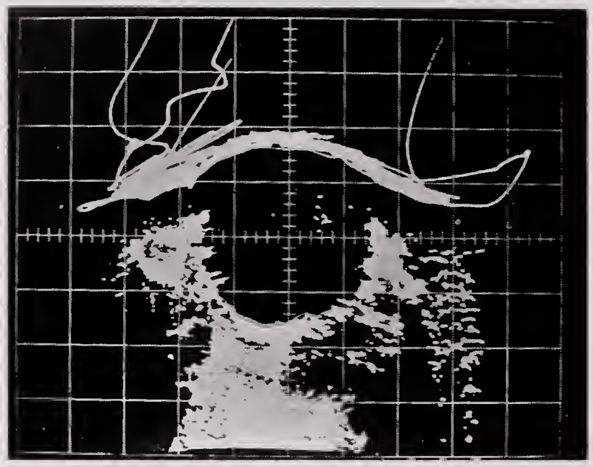

Fig. 20 A transverse scan of the previous patient showing essentially midline structure. At laparotomy, this was confirmed as a benign tumor of the ovary.

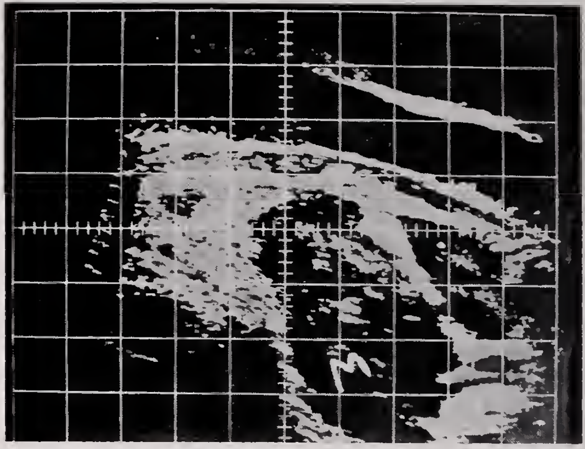

Fig. 21 A 24-year-old woman seen with a large fixed pelvic mass (M). Note the rather irregular and mottled appearance of the tumor outline as well as the intracavitary blips.

of scanning with accurate measurements to go with the clinical picture. Some efforts have been made to distinguish the malignant masses from the benign and the cystic from the solid. Several examples are shown in Figs. 17 through 22.

It has been shown that the applications of the ultrasonography seem to be manifold. Limitations to its usefulness, in our hands, have been directly proportional to the experience of the operator. In many instances, the findings are of a confirmatory nature and do not alter the planned therapy.

We do not imply that we have been 100% successful in any and all of the before mentioned uses. As indicated earlier, we have had our learning pains and embarrassing moments, particularly when a second twin appears unexpectedly after scanning.

Ultrasonography, like so many other procedures and laboratory tests, is not the total answer, but it is an adjunct to be correlated with the clinical picture. We feel it has been an interesting and valuable tool.

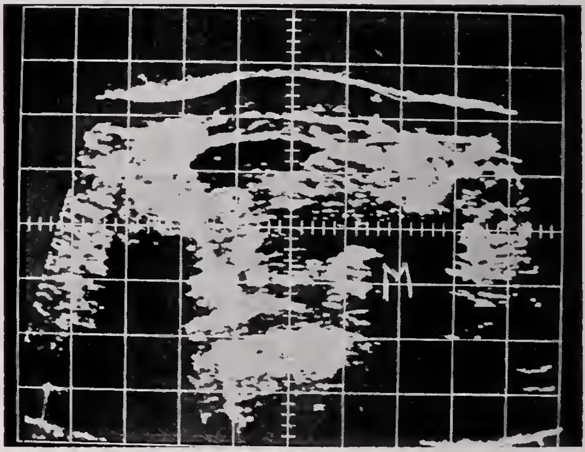

Fig. 22 A transverse scan of the previous patient again showing irregularity and ragged appearance of this tumor mass (M). At laparotomy, this was found to be a malignant tumor of the ovary with metastasis.

On-the-Job Training of the Pediatric Nurse Practitioner

An Evaluation

A PEDIATRIC NURSE PRACTITIONER is a registered nurse who has completed an action-oriented training program in ambulatory pediatrics, a pediatric setting geared to care for the nonhospitalized pediatric patient.[1-7]

The shortage of pediatric health manpower and the need to improve the delivery of health care to children requires no discussion. There is a need for doctors and an even greater need for nurses. However, a pediatric nurse practitioner program does not remove nurses from nursing; it allows them to enlarge their knowledge and confidence in order to function more effectively in a primary care pediatric ambulatory setting.[1, 2]

There are numerous programs training pediatric nurse practitioners in the United States;[3] some are training nurses who are not employed while they are attending the program[4-6] and some are geared only for nurses who are fully employed at the time.[7] In our hospital, we train only nurses who are fully employed while going through the program.

Regardless of the method of training, both consumers' acceptance of the pediatric nurse practitioner as well as measurements of the trainee's knowedge become essential in establishing the usefulness of such professionals. In this paper, both consumers' acceptance of the program as well as an ongoing evaluation of the trainee's knowledge were measured.

METHOD

The program was evaluated in two areas: (1) by measuring consumers' acceptance of the training of pediatric nurse practitioners and (2) by measuring the trainee's knowledge.

Consumers' acceptance was measured in 200 randomly selected parents bringing their children for care at Cardinal Glennon Memorial Hospital for Children, which is a midwestern teaching hospital. One hundred parents completed the questionnaire before the nurse practitioners were delivering care and one hundred additional parents did so after the nurse practitioners were actively delivering care in our Clinic. Consumers' acceptance was measured by means of a questionnaire which explained the program to the parents and also requested them to state their attitude toward the program in a scale of zero to ten in which zero represented the lowest acceptance and ten the highest. The questionnaire can be obtained from the authors upon request.

The trainees were all registered nurses who were employed full time and who were selected on their motivation for participating in the program and on their future goals. In order to do so, their knowledge was evaluated by written examinations for ambulatory pediatrics given at the onset, at the end of the first quarter and at the end of the program using other nurses (RN), senior medical students (SMS) and pediatric residents (PR) as control.

The written examinations were designed to

In this study, acceptance of pediatric nurse practitioners by the consumers as well as the trainee's knowledge were measured. Evaluation showed that a midwestern consumer population accepted pediatric nurse practitioners well and that on-the-job training of nurses as pediatric nurse practitioners seems to be an effective way to increase the nurse's knowledge of ambulatory pediatrics. This paper was presented in part at the Ambulatory Pediatric Association 11th Annual Meeting and at the 99th American Public Health Association Meeting in 1971. The authors are from the Department of Pediatrics, St. Louis University School of Medicine.

cover primary care pediatrics, as follows: (1) health supervision including history and physical examination as well as developmental appraisal, (2) clinical problems encountered in primary care pediatrics and (3) social problems encountered in primary care pediatrics.

Results

Pediatric nurse practitioners were well accepted by the consumers. The mean score of the consumers' acceptance questionnaire was nine in a scale of zero to ten. The mean acceptance scores, before and after the nurse practitioners were delivering care, were actually nine and 9.8 respectively.

Table 1 shows the results of the written examinations. At the onset of the program, the six pediatric nurse practitioners (PNP) in our program, all employed full-time and all selected because of motivation, scored higher than a stratified random sample of registered nurses (RN) working in our hospital. [The mean score for the pediatric nurse practitioner (PNP) was 56 ± 9 (± S.D.) and for the stratified sample of nurses (RN) working in the hospital was 34 ± 14 (± S.D.) p less than 0.01, equal to senior medical students (SMS). The mean score for the pediatric nurse practitioner (PNP) was 56 ± 9 (± S.D.) and for the senior medical students (SMS) was 57 ± 8 (± S.D.) p greater than 0.05, and lower than pediatric residents (PR). The mean score for the pediatric nurse practitioner (PNP) was 56 ± 9 (± S.D.) and for the pediatric residents (PR) was 86 ± 9 (± S.D.) p less than 0.01.]

TABLE 1

RELATIVE PERFORMANCE OF PEDIATRIC NURSE PRACTITIONER

	Onset (PNP=56±9)	*First Quarter* (PNP=85±15)	*End* (PNP=91±4)
Nurse . .	$34 \pm 14 p < 0.01$		
SMS . . .	$57 \pm 8 p > 0.05$	$65 \pm 10 p < 0.01$	$63 \pm 17 p < 0.01$
PR	$86 \pm 9 p < 0.01$		$94 \pm 1 p > 0.05$

At the end of the first quarter of the program, the pediatric nurse practitioners were found to score higher than the senior medical students (SMS). [The mean score for the pediatric nurse practitioner (PNP) was 89 ± 11 (± S.D.) and for the senior medical students (SMS) was 65 ± 10 (± S.D.) p less than 0.01.]

At the end of the program, i.e., at the end of 200 hours of instruction (100 didactic lectures and 100 of supervised clinical experience) spread over eight months, the pediatric nurse practitioners were found again to score higher than the senior medical students. [The mean score for the PNP was 91 ± 4 (± S.D.) and for the SMS was 63 ± 17 (± S.D.) p less than 0.01] and equal to pediatric residents. The mean score for the pediatric resident was 94 ± 1, and for the pediatric nurse practitioner 91 ± 4, p greater than 0.05.]

Comments

To cope with the shortage of pediatric manpower and the increased demand for health care, a pediatric nurse practitioner program was started in a midwestern teaching hospital.

The methods of training pediatric nurse practitioners in the United States are numerous at the present time.[1-8] However, regardless of the method of training employed, the consumers' acceptance as well as the trainee's knowledge are essential parameters in the evaluation of such programs.

Although the validity of a questionnaire to measure consumers' acceptance as well as the acceptance of pediatric nurse practitioners can be argued,[9] questionnaires are useful, commonly-utilized tools to measure doctor-patient interactions.[2-11] Of course, how well prepared health professionals are becomes immaterial if they are unacceptable to the consumer. The present study shows by means of a questionnaire that a midwestern consumer population accepted pediatric nurse practitioners well.

The present study also shows that pediatric nurse practitioners in training improved significantly in their knowledge of primary care pediatrics as measured against other health professionals in training by means of written examinations.

Adequate evaluation of the level of knowledge is always difficult to accomplish. By and large, in the entire educational system of more accepted health professionals (for example, medical students and residents), we depend upon examinations which, to a great extent, are written.[12, 13] There have been a few attempts to measure health professionals in training by techniques other than a written or oral examination. Some of these techniques are by videotaping interviews,[14] by evaluations of patient care by an index disease[15] and by evaluation of physical assessment of children comparing nurse practitioner and pediatrician.[16] The results of these attempts are interesting but they are still experimental. In the present study, nurse-practitioner knowledge was measured by written examinations and was found to be adequate to deliver primary care pediatric services.

This preliminary evaluation showed that a midwestern consumer population accepted the training of PNPs well and that on the job training of fully-employed nurses as PNPs seems to be an effective way to increase nurses knowledge of ambulatory pediatrics.

ABFP Certification Examination

The American Board of Family Practice announces that it will give its next two-day written certification examination on Oct. 20-21, 1973. It will be held in various centers geographically distributed throughout the United States. Information regarding the examination can be obtained by writing to Nicholas J. Pisacano, M.D., Secretary, American Board of Family Practice, Inc., University of Kentucky Medical Center, Annex #2, Room 229, Lexington, Ky. 40506.

Please Note: It is necessary for each physician desiring to take the examination to file a completed application with the Board office. Deadline for receipt of applications in this office is *Aug. 1, 1973.*

VASODĪLAN®

(ISOXSUPRINE HCl)

the compatible vasodilator

- no interference with diabetic control . . . does not al carbohydrate metabolism.[1]
- conflicts have not been reported with diuretics, corticosteroids, antihypertensives or miotics.

There are no known contraindications in recommend oral doses other than it should not be given in the prese of frank arterial bleeding or immediately postpartum

INDICATIONS: Based on a review of this drug by the National Academy of Sciences–National Research Council and/or other information, the FDA has classified the indications as follows:

Possibly Effective:

1. For the relief of symptoms associated with cerebral vascular insufficiency.
2. In peripheral vascular disease of arteriosclerosis obliterans, thromboangiitis obliterans (Buerger's disease) and Raynaud's disease.
3. Threatened abortion.

Final classification of the less-than-effective indications requires further investigation.

COMPOSITION: Vasodilan tablets, isoxsuprine HCl, 10 mg. and 20 mg.

© 1972 MEAD JOHNSON & COMPANY · EVANSVILLE, INDIANA 47721 U.S.A. 10372

DOSAGE AND ADMINISTRATION: 10 to 20 mg. three or four times da

CONTRAINDICATIONS AND CAUTIONS: There are no known contraindications to oral use when administered in recommended doses. Should not be given immediately postpartum or in the presence of arterial bleeding.

ADVERSE REACTIONS: On rare occasions, oral administration of the d has been associated in time with the occurrence of severe rash. When ras appears, the drug should be discontinued. Occasional overdosage effects such as transient palpitation or dizziness are usually controlled by reducing the dos

SUPPLIED:

Tablets, 10 mg.—bottles of 100, 1000, 5000 and Unit Dose
20 mg.—bottles of 100, 500 and Unit Dose

LABORATO

President's Message

As this reaches you, your officers and executive staff, as well as the designated committees, are in the throes of preparing for the MSMA Annual Session in St. Louis on March 29-April 1. The full program has been published in the February issue and this issue of Missouri Medicine. Certainly, 27 scientific programs instituted by 20 specialty societies should furnish you with an opportunity for postgraduate education. The St. Louis hosts are working on some unusual entertainment features and the Woman's Auxiliary to the MSMA has a full schedule of events for our ladies.

Walter T. Gunn, M.D.

At the last Council meeting, Dr. Herbert R. Domke reported in regard to the State Health Commission. He expects sweeping reforms of the present health programs set-up by both President Nixon and Governor Bond. Unfortunately, one of the casualties seems to be the Bi-State Regional Medical Program covering the St. Louis area and Southern Illinois. Interested doctor-members of this group are working diligently to have the program reinstated. The AMA *Legislative Roundup* for Feb. 9, 1973 reports, "*Federal Rules of Evidence* . . . Wednesday, the Senate by a voice vote adopted S. 583 which would postpone the effective date of a new code of evidence to be applied in the federal courts throughout the country. With the exception of communications during psychotherapy treatment, the proposed rules would abolish the physician-patient privilege in federal court proceedings. Accordingly, any communication outside of psychotherapy could be divulged in federal court."

Dean William Mayer of Missouri University stated that he had just attended a meeting of all state licensing boards plus other organizations, and he notified us that recertification is definitely coming up in both states and specialty groups. In fact, no less than seven specialty groups are now actively preparing plans for recertification. On May 11-13 at the Lodge of the Four Seasons, Lake of the Ozarks, the Missouri Hospital Association will hold a TAP session which will be cosponsored by the MSMA. The Joint Commission on Accreditation of Hospitals will explain what it believes to be a critical deficiency in hospital operations—a dearth of acceptable internal quality assurance programs (QAP). A physician on your hospital staff should attend.

At the Public Affairs Conference on February 3-4, Mr. Lee Mortenson of the AMA stated that 2,400 physicians in the state of Missouri do not belong to the AMA. If you have a physician friend or acquaintance in this category, invite him to see MSMA in action at the Annual Convention.

See you in St. Louis on March 29.

President

EDITORIAL

PLAN AHEA^{D} for AN OUTSTANDING MEETING

This is a special invitation to all members of the MSMA to plan now to take advantage of the 115th Annual Session from March 29 through April 1, 1973 at the Chase-Park Plaza Hotel in St. Louis. Planning ahead is essential for the physician if he is to be free to attend the entire meeting and obtain the fullest benefit of the great and many opportunities offered by the scientific programs and exhibits.

The scientific program for 1973 involves the largest number of individual sessions ever offered at our annual conventions. We will not give a detailed review of it here, but we do ask you to turn to page 146 of this Journal where you will find the complete scientific program and a listing of all events of the meeting.

There will be 27 important scientific sessions on Friday and Saturday. Sponsoring organizations which have invested a great deal of time and effort in arranging the programs include the Missouri State Allergy Association; Missouri Society of Internal Medicine; Missouri Chapter, American College of Physicians; Missouri Chapter, American Academy of Pediatrics; Missouri Psychiatric Association; Missouri Academy of Psychiatry; Missouri State Surgical Society; Missouri Society of Anesthesiologists; Missouri Division, American Cancer Society; Missouri Ophthalmological Society, Inc.; Missouri Radiological Society; Missouri Heart Association; and Missouri Dermatological Society, Inc.

The general sessions at 9 AM each day preceding the scientific sessions will be valuable to physicians of all specialties. On Friday, Missouri Congressman James W. Symington and Kentucky Congressman Tim Lee Carter will discuss pending national health insurance programs legislation. On Saturday, representatives of the American College of Physicians, American College of Surgeons and the American Medical Association will discuss the subject, "Whither Medicine."

We also call your attention to the nine specialty organizational luncheons or dinners to be held on Friday and Saturday, in addition to the University of Missouri Alumni Luncheon on Friday and the MSMA General Luncheon and 50-Year Club Luncheon on Saturday.

The St. Louis University and Washington University Alumni groups have scheduled individual receptions on Saturday preceding the Annual Banquet in Honor of Past-Presidents of the MSMA, which is the most important social event of the meeting for physicians and their wives.

A visit to the House of Delegates is important in order to understand fully the democratic workings of the MSMA. The House of Delegates will meet at 1:30 PM on Thursday and at 4 PM on Friday, with a final breakfast meeting at 7:30 AM on Sunday for concluding the business of the session. You are urged to attend the Reference Committee meetings, express your opinions and make your own personal recommendations by participating in the true democratic process that prevails in the Association.

The technical exhibits are always well worth viewing and a source of information. Also, it is imperative that we all cooperate by visiting these exhibits so that the exhibitors will continue to participate in our annual meeting.

Will your wife accompany you to the Annual Session? Please assure her that she will be welcomed at the Annual Convention of the MSMA Woman's Auxiliary which will be held in conjunction with the Annual Session at the Chase-Park Plaza Hotel. She'll enjoy meeting the other physicians' wives and attending the interesting meetings, luncheons, receptions and other convention activities. If she is not a member, she should contact Mrs. Keith D. Jones, President, upon her arrival or visit the Woman's Auxiliary registration desk Thursday afternoon or Friday for more information.

To sum it up, the 115th Annual Session promises to be outstanding. It represents a year of planning ahead so that the family physician and the specialist can benefit from the timely topics to be presented by outstanding authorities. Select the subjects of your choice now and arrange to be there.

In addition to the acquisition of knowledge, there is the satisfaction that comes with learning, the healthful relaxation of getting away from it all, the joys of seeing friends, classmates and colleagues and the knowledge that you are an active member of the Missouri State Medical Association and, thus, contributing to its activities and the policies and decisions that will affect medicine and health care in the year to come.

County Society News

FIRST DISTRICT

COUNCILOR
JOHN N. MARTIN, M.D., ST. JOSEPH

Buchanan County Medical Society

A joint meeting of the St. Joseph and area pharmacists and the Buchanan County Medical Society was held on January 3 in the Empire Room of the Hotel Robidoux in St. Joseph. The event featured a dinner and program.

Presiding jointly were Dr. Elza F. Butler, President of the Medical Society, and Mr. William J. Kenney, area council representative of the Missouri Pharmaceutical Association. The speaker was Dr. William A. Strickland, Jr., dean and professor of pharmacy at the University of Missouri-Kansas City. Dr. Strickland's subject was "Pharmacy Education in Missouri—Today and Tomorrow." He also discussed "Area Health Education Center Concept as It May Affect the St. Joseph Area."

Arrangements for the program were made by Dr. William B. Rost for the Medical Society and Mr. Kenney. Meeting details were arranged by members of the Medical Society Program Committee, who are Drs. Gerald E. Fox, Chairman; Edward M. Beheler and Sydney L. Bryant. Fifty-four physicians and pharmacists attended the meeting.

Pinworm therapy is often a family affair

Contraindications: History of hypersensitivity to thiabendazole. **Warnings:** If hypersensitivity reactions occur, drug should be discontinued immediately and not resumed. Rarely, erythema multiforme has been associated with thiabendazole therapy; in severe cases (Stevens-Johnson syndrome), fatalities have occurred. Because CNS side effects may occur quite frequently, activities requiring mental alertness should be avoided. Safe use in pregnancy or lactation has not been established. **Precautions:** Ideally, supportive therapy is indicated for anemic, dehydrated, or malnourished patients prior to initiation of anthelmintic therapy. In presence of hepatic or renal dysfunction, patients should be carefully monitored. **Adverse Reactions:** Most frequently encountered are anorexia, nausea, vomiting, and dizziness. Less frequently, diarrhea, epigastric distress, pruritus, weariness, drowsiness, giddiness, and headache have occurred. Rarely, tinnitus, hyperirritability, numbness, abnormal sensation in eyes, blurring of vision, xanthopsia; hypotension, collapse; enuresis; transient rise in cephalin flocculation and SGOT; perianal rash, cholestasis and parenchymal liver damage; hyperglycemia; transient leukopeni malodor of the urine, crystalluria, hematuria; appearance of liv Ascaris in the mouth and nose. Hypersensitivity reactions

A New Dosage Form:

Chewable Tablets 500 mg Mintezol®

(THIABENDAZOLE | MSD)

so easy to take everyone in the family can keep to the regimen you prescribe

include: fever, facial flush, chills, conjunctival injection, angioedema, anaphylaxis, skin rashes, erythema multiforme (including Stevens-Johnson syndrome), and lymphadenopathy. **Supplied:** Chewable tablets, containing 500 mg thiabendazole, in boxes of 36, strip packaged, individually foil wrapped; Suspension, containing 500 mg thiabendazole per 5 cc, in bottles of 120 cc.

addendum

INDICATION | DOSAGE SCHEDULE

MINTEZOL® (Thiabendazole, MSD) has demonstrated effectiveness against a broad spectrum of nematode infections. Dosages are weight related. For your convenience, the information in the weight-dose chart below is included in the full prescribing information and in the 1973 edition of PDR.
The recommended maximum daily dose of MINTEZOL is 3 g (6 tablets).
MINTEZOL should be given after meals if possible. Dietary restriction, complementary medications, and cleansing enemas are not needed.
The usual dosage schedule for all conditions is two doses per day. The size of the dose is determined by the patient's weight.

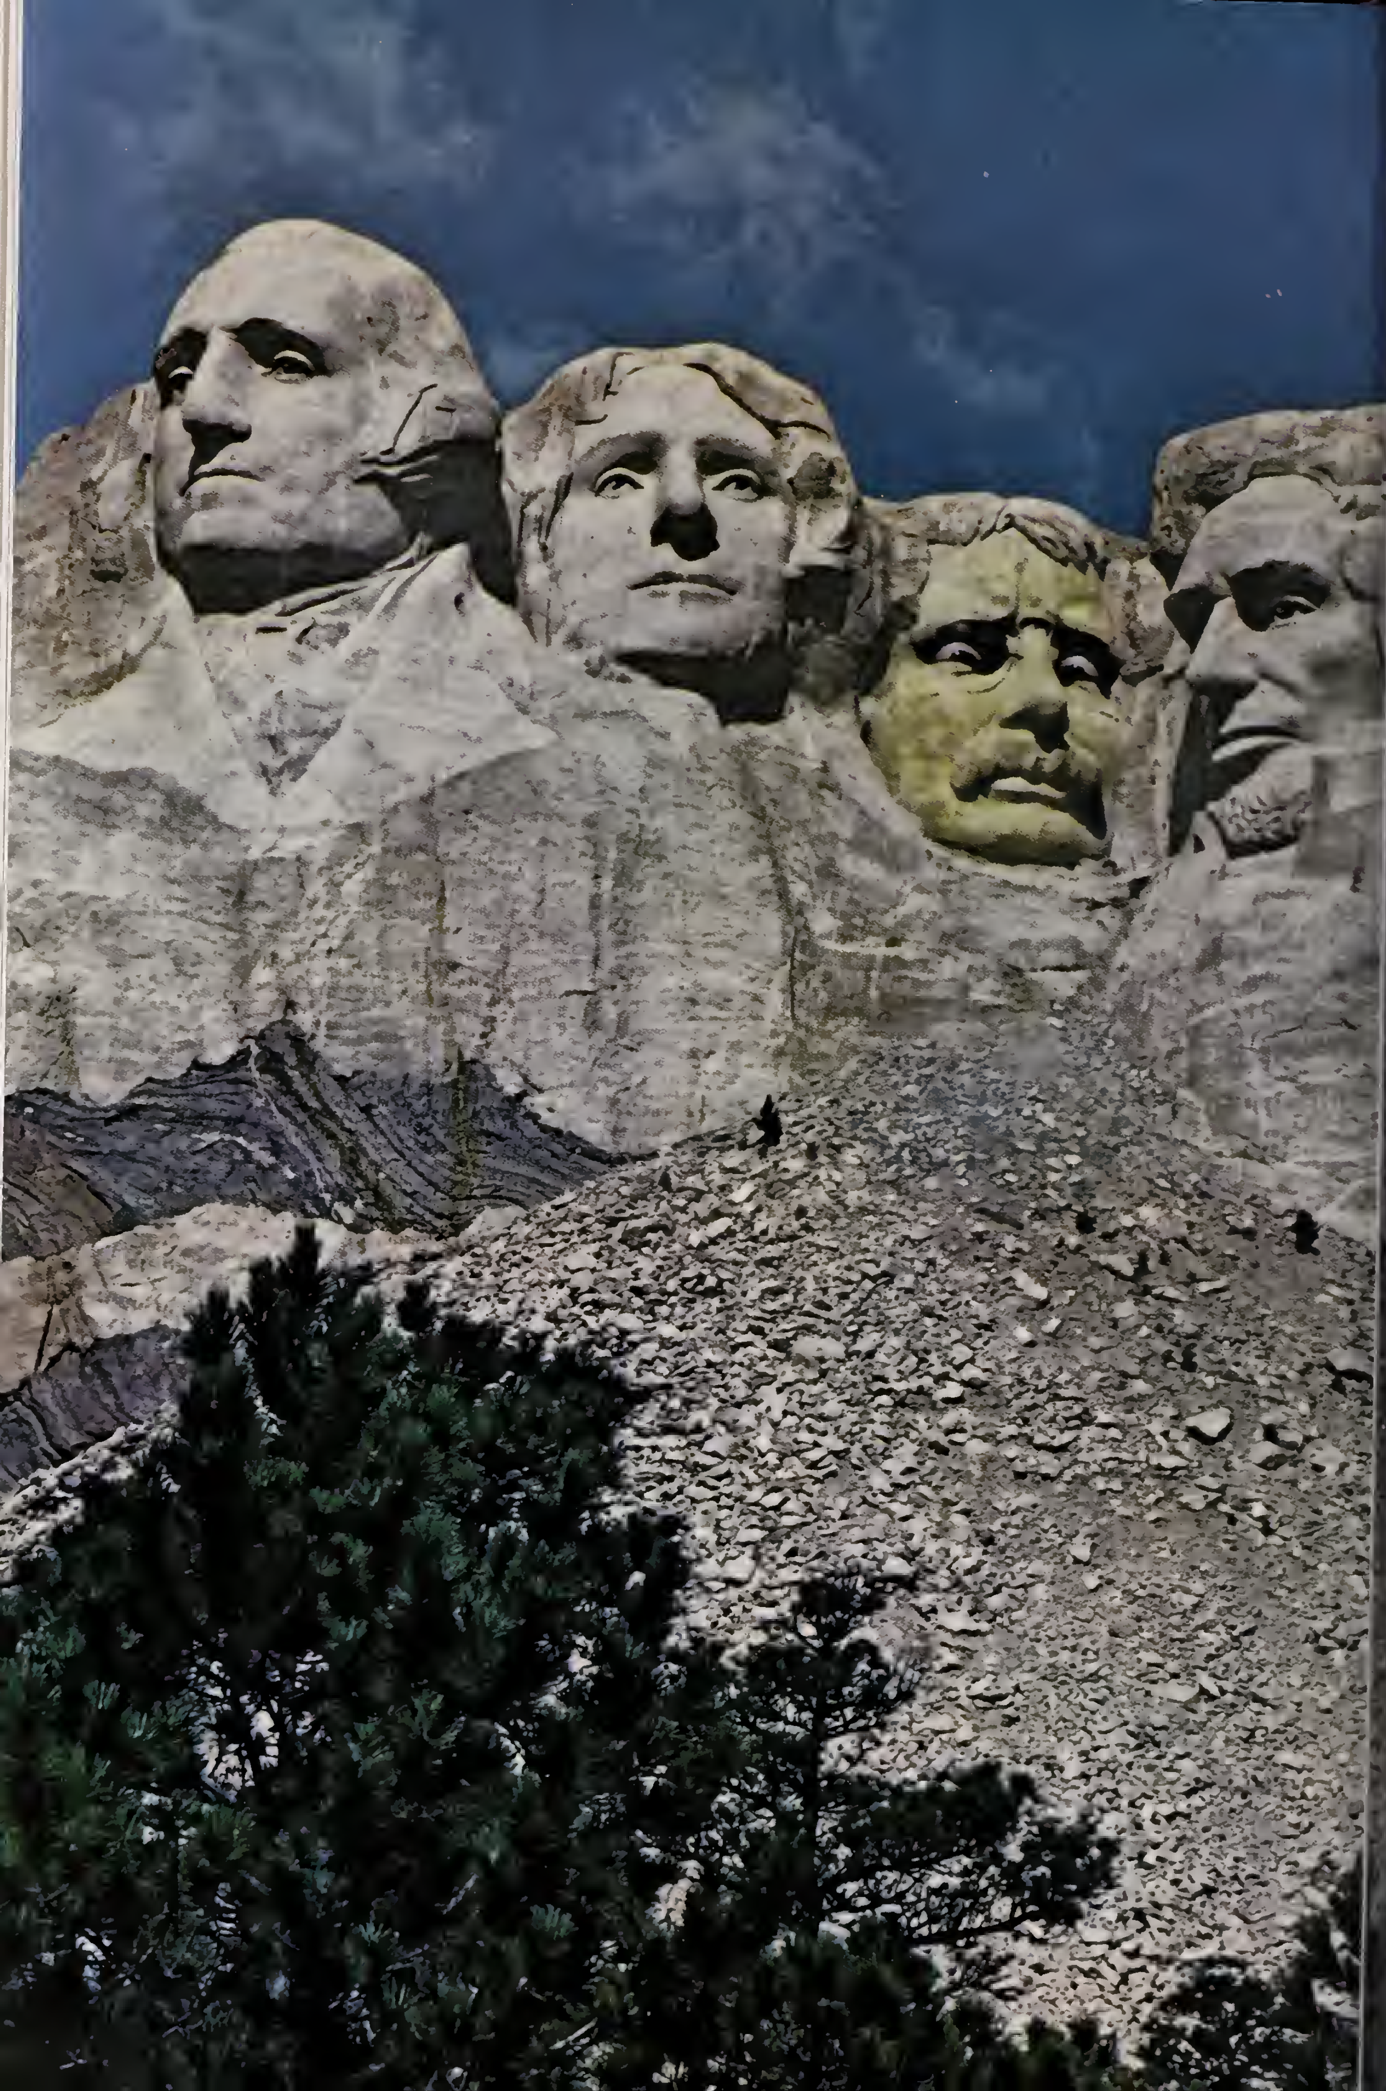
Weight-dose chart:

WEIGHT (lb)	EACH DOSE (g)	TABLETS
25	0.25	½
50	0.5	1
75	0.75	1½
100	1.0	2
125	1.25	2½
150 & over	1.5	3

The regimen for each indication follows:

INDICATION	REGIMEN	COMMENTS
Pinworm disease	Two doses per day for 1 day. Repeat in 7 days. This regimen is designed to reduce the risk of reinfection.	If this is not practical, give 2 doses per day for 2 successive days.
Threadworm,* large roundworm,* hookworm,* and whipworm* disease	Two doses per day for 2 successive days.	A single dose of 20 mg/lb or 50 mg/kg may be employed as an alternative schedule, but a higher incidence of side effects should be expected.
Creeping eruption	Two doses per day for 2 successive days.	If active lesions are still present 2 days after completion of therapy, a second course is recommended.
Symptoms of trichinosis* during the invasive phase of the disease	Two doses per day for 2 to 4 successive days according to the response of the patient.	The optimal dosage for the treatment of trichinosis has not been established.

*Clinical experience with thiabendazole for treatment of each of these conditions in children weighing less than 30 lb has been limited.



Let's make his position perfectly clear...

Antivert®
(meclizine HCl)
for vertigo*

ntivert® (meclizine HCl) has been found
seful in the management of vertigo associ-
ted with diseases affecting the vestibular sys-
m. It is available as Antivert (12.5 mg.
eclizine HCl) and Antivert/25 (25 mg.
eclizine HCl) scored tablets for conven-
nce and flexibility of dosage. Antivert/25
25 mg. meclizine HCl) Chewable Tablets
re available for the management of nausea,
omiting, and dizziness associated with mo-
on sickness.

*INDICATIONS. Based on a review of this drug by the National Academy of Sciences-National Research Council and/or other information, FDA has classified the indications as follows:

Effective: Management of nausea and vomiting and dizziness associated with motion sickness.

Possibly Effective: Management of vertigo associated with diseases affecting the vestibular system.

Final classification of the less than effective indications requires further investigation.

CONTRAINDICATIONS. Administration of Antivert during pregnancy or to women who may become pregnant is contraindicated in view of the teratogenic effect of the drug in rats.

The administration of meclizine to pregnant rats during the 12th-15th day of gestation has produced cleft palate in the offspring. Limited studies using doses of over 100 mg./kg./day in rabbits and 10 mg./kg./day in pigs and monkeys did not show cleft palate. Congeners of meclizine have caused cleft palate in species other than the rat.

Meclizine HCl is contraindicated in individuals who have shown a previous hypersensitivity to it.

WARNINGS. Since drowsiness may, on occasion, occur with use of this drug, patients should be warned of this possibility and cautioned against driving a car or operating dangerous machinery.

Usage in Children: Clinical studies establishing safety and effectiveness in children have not been done; therefore, usage is not recommended in the pediatric age group.

Usage in Pregnancy: See "Contraindications."

ADVERSE REACTIONS. Drowsiness, dry mouth and, on rare occasions, blurred vision have been reported.

in Brief

A summary of AMA, medical & health news

American Medical Association
535 N. Dearborn St.
Chicago, Ill. 60610

The 26th National Conference on Rural Health of the AMA will be held on March 29-30 in Dallas at Statler-Hilton Hotel. Theme of the conference will be "Rural Health—Innovation to Implementation." Conference goals will be fourfold: to study community organization for rural health services; to emphasize coordination of rural development and rural health services; to review some possible solutions for rural health care delivery systems; and to study evaluation techniques for rural health services.

Presiding will be Robert E. Reiheld, M.D., of Orrville, Ohio, chairman of the AMA's Council on Rural Health.

AMA's Medicredit plan, a national health insurance proposal that would provide federal income tax credits to help finance the purchase of private health insurance, had 130 sponsors in Congress within a week after it was introduced. The Senate number of the bill is S 444. The House number is HR 2222. New features of this year's bill are coverage of home health care services, dental care for children and emergency dental services for all. Coverage against catastrophic illness would be financed by the government for all citizens.

All U. S. physicians will receive an AMA questionnaire concerning professional activities. Information from the questionnaires will be used in the publication of the 1973 edition of the AMA's *American Medical Directory*.

Price schedules and signs are no longer required in physicians' offices and health care institutions. Phase 3 price control regulations revoked the Phase 2 regulation that had required physicians and institutions to keep available for public inspection a schedule of charges for principal services and to post a sign giving the location of the schedule.

AMA's Volunteer Physicians for Vietnam Program, funded by the Agency for International Development, will continue at least through next June. The program will concentrate on establishing continuing medical education. Physicians interested in volunteering for 60-days of service should contact Volunteer Physicians for Vietnam, AMA Headquarters.

**Gantrisin® (sulfisoxazole) Roche® provides
your patients with
many important advantages:**

- high urinary levels
- generally good tolerance
- high solubility at average urinary pH
- rapid absorption
- rapid renal clearance
- high plasma concentrations
- economy (average cost of therapy: less than 6½¢ per tablet)

**Before prescribing, please consult complete proc
information, a summary of which follows:**

Indications: Nonobstructed urinary tract infecti
(mainly cystitis, pyelitis, pyelonephritis) due to s
ceptible organisms. **Important Note:** ***In vitro*** **s
sitivity tests not always reliable; must be coordina
with bacteriological and clinical response.
aminobenzoic acid to follow-up culture media.
creasing frequency of resistant organisms limits u
fulness of antibacterial agents, especially in chro
and recurrent urinary infections.** Maximum safe t
sulfonamide blood level, 20 mg/100 ml; meas
levels as variations may occur.

Contraindications: Hypersensitivity to sulfonamic
infants less than 2 months of age; pregnancy at t
and during the nursing period.

Warnings: Safety in pregnancy not established.
not use for group A beta-hemolytic streptococcal
fections, as sequelae (rheumatic fever, glomerulc
phritis) are not prevented. Deaths reported f
hypersensitivity reactions, agranulocytosis, apla
anemia and other blood dyscrasias. Sore throat, fe
pallor, purpura or jaundice may be early indicati
of serious blood disorders. CBC and urinalysis v
careful microscopic examination should be perforr
frequently.

Precautions: Use cautiously in patients with impai
renal or hepatic function, severe allergy or bronc
asthma. Hemolysis, frequently dose-related, may
cur in glucose-6-phosphate dehydrogenase-defic
patients. Maintain adequate fluid intake to prev
crystalluria and stone formation.

Adverse Reactions: *Blood dyscrasias:* Agranulc
tosis, aplastic anemia, thrombocytopenia, leukope
hemolytic anemia, purpura, hypoprothrombinemia
methemoglobinemia; *Allergic reactions:* Erythe
multiforme (Stevens-Johnson syndrome), generali
skin eruptions, epidermal necrolysis, urticaria, se
sickness, pruritus, exfoliative dermatitis, anaphy
toid reactions, periorbital edema, conjunctival
scleral injection, photosensitization, arthralgia and
lergic myocarditis; *Gastrointestinal reactions:* Naus
emesis, abdominal pains, hepatitis, diarrhea, a
rexia, pancreatitis and stomatitis; *C.N.S. reactic*
Headache, peripheral neuritis, mental depressi
convulsions, ataxia, hallucinations, tinnitus, ver
and insomnia; *Miscellaneous reactions:* Drug fe
chills and toxic nephrosis with oliguria and anu
Periarteritis nodosa and L.E. phenomenon have
curred. Due to certain chemical similarities with sc
goitrogens, diuretics (acetazolamide, thiazides)
oral hypoglycemic agents, sulfonamides have cau
rare instances of goiter production, diuresis and hy
glycemia as well as thyroid malignancies in rats
lowing long-term administration. Cross-sensiti
with these agents may exist.

Supplied: Tablets containing 0.5 Gm sulfisoxazole.

Roche Laboratories
Division of Hoffmann-La Roche
Nutley, N.J. 07110

cute, recurrent or chronic nonobstructed cystitis

THREE OTHER BUILT-IN BENEFITS OF GANTRISIN®

sulfisoxazole/Roche®

3.

High solubility at average urinary pH
Gantrisin's unusual solubility is the main reason for its relatively low toxicity. In both free and acetylated forms, it is highly soluble at urinary pH values of 5.5 to 6.5, so there is no need for prophylactic alkali therapy.

4.

Rapid absorption
Gantrisin reaches its sites of action quickly. Measurable levels of the drug have been found in blood and urine within 60 minutes; in 2 to 3 hours, therapeutic levels usually have been reached.

5.

Rapid renal clearance
Gantrisin's rapid excretion rate is another reason why it is generally well tolerated. Over 50% of a single oral dose is excreted in 8 hours, over 90% in 24 to 48 hours, so there is little risk of hematuria or crystalluria, and anuria is rare. As with all sulfonamides, adequate fluid intake must be maintained. Complete blood counts and urinalyses, with careful microscopic examination, should be performed frequently.

For nonobstructed cystitis due to *E. coli* and other susceptible organisms

FINANCIAL STATEMENT FOR THE YEAR 1972

LENNERTSON & COMPANY
Certified Public Accountants
ST. LOUIS, MISSOURI 63105

January 26, 1973

Missouri State Medical Association
515 East High Street
Jefferson City, Missouri 65101

Gentlemen:

The accounts of the Missouri State Medical Association, a non-profit Missouri corporation, were reviewed for the year 1972, and a report thereon is presented together with the following exhibits:

Exhibit A	Balance Sheet
Exhibit B	Income Statement
Exhibit C-1	Statement of Commissions and Meeting Expenses
Exhibit C-2	Statement of Investments
Exhibit D	Dues Receivable and Memberships by Societies

It should be noted that members' dues and investment income are taken into income on the cash receipt basis whereas the other accounts are maintained on the accrual basis. Rentals received in advance for Annual Session exhibit space are shown as prepaid and carried forward to the year to which they apply.

Scope of Examination

The Balance Sheet at December 31, 1972 and the Income Statement for the year then ended were reviewed. Examinations or tests were made of the accounting records, in the manner and to the extent deemed appropriate, without making a detailed audit of the transaction.

Recorded cash receipts for the year were traced in total into the bank as deposits and disbursements for the period were substantiated by an inspection of paid checks, purchase invoices and other data on file.

Selective tests were made of the income and expense accounts for the period. It was noted that space in the Journal was contributed to the United States Treasury Department for bond advertising, to members for small classified ads, and to public service organizations.

Income Statement

The financial result of activities of the Association for the year 1972 was an excess of income over expenses of $18,191.85 as set forth in Exhibit B.

Balance Sheet

The financial position of the Association at December 31, 1972 is presented in Exhibit A. Comments on the larger balance sheet accounts follow:

Cash in banks, as shown by the books, was reconciled to the regular monthly bank statements and confirmations received from the depositaries. The petty cash fund was verified by physical count.

Investments with a cost of $131,321.37 were confirmed by a statement from the custodian, Mercantile Trust Co. Investment income for the year was as follows:

Interest—Certificate of Deposit	$ 6,232.43
Interest and discount on bonds	3,257.96
Dividends on Stock	2,936.34
Total Investment Income	$12,426.73

Accounts Receivable—Advertisers of $5,801.85 represent the unpaid balance due from Journal advertisers. Of this amount $5,600.29 was due from the State Journal Advertising Bureau as follows:

December 1972	$2,635.84
November 1972	2,028.35
Prior to November 1972	936.10
Total	$5,600.29

In January, 1973, a check was received paying $3,307.69 of the November and prior accounts.

Unpaid dues of $5,706.25, offset by a reserve account in like amount, represent 1972 dues of delinquent members carried at the request of local Societies. Other delinquent members were dropped from membership in accordance with the by-laws. Exhibit D presents a summary of unpaid dues and membership by Societies, as shown by the records of the Association.

During the year 1972, the Association purchased land and building at 113 Madison Street, Jefferson City, Missouri for $42,660.35. Extensive renovation was started in January, 1973, and it is anticipated that the Association will move to its new offices about May 1, 1973.

Furniture and fixtures continue to be stated in the fixed amount of $1,000. Equipment purchases, rentals and repairs for the year in the sum of $2,994.23 were charged to expense in lieu of depreciation.

The records were carefully reviewed for liabilities at December 31, 1972 and it is believed that all current liabilities of substantial amount are included in the Balance Sheet.

Exhibitors have made advance payments of $3,025.00 for annual session exhibit space and these payments will be taken into income when earned in 1973.

The excess of assets over liabilities in the amount of $196,993.45 is shown in the Balance Sheet as a "Reserve for Future Activities."

General

During the year, payments were made to and for the following sponsored organization:

Missouri State Medical Association Pension Fund—	
Employees' Retirement Insurance Pension	$ 7,729.03
Employees' Pension Plan Contribution	2,467.03
Total	$10,196.06

The association continues to provide indirect financial assistance to the Missouri State Medical Foundation (Medical Student Loan Fund).

Collections for the American Medical Association and the Missouri State Medical Foundation are made along with the Missouri State Medical Association annual dues. Following is a schedule of dues and assessments for each member in effect prior to April 9, 1972:

	Active	*Junior*
Journal	$ 3.00	$ 3.00
Association General Fund	62.00	29.50
Foundation Assessment	10.00	5.00
Missouri State Medical Association— Dues and Assessments	$ 75.00	$ 37.50
American Medical Association	110.00	110.00
Totals	$185.00	$147.50

After April 9, 1972, Junior members are interns and residents only and the dues for the Missouri State Medical Association are $10.00 and $20.00 to the American Medical Association per year.

Except for $182.50, the 1972 collections of $37,422.50 for the Missouri State Medical Foundation have been remitted along with $97.50 due from the year 1971. The $110 per member collected for the A.M.A. totalling $347,380.00 has been remitted except for $75.00.

Insurance policies were inspected and the following general insurance was in force at the close of the year:

Insurance on	*Type of Coverage*	*Amount*
Furniture and Fixtures	Fire and Extended Coverage (80% co-ins.)	$6,500
Employees	Workmen's Compensation	Statutory
Lessee's Liability	Bodily Injury	$50,000/100,000
President, Executive Secty., Office Manager, Bookkeeper, Stenographer	Fidelity Bond	$10,000
Treasurer	Fidelity Bond	$20,000
Journal Publication	Publisher's Liability ($2,500 deductible)	$500,000
Journal Publication	Advertisers' Libel ($2,500 deductible)	$500,000
Automobiles of Three Assistant Secretaries	Non-ownership—Bodily Injury	$100,000/300,000
	Non-ownership—Property Damage	$25,000
Executive Secretary Leased Auto	Non-ownership—Bodily Injury	$100,000/300,000
	Non-ownership—Property Damage	$50,000
	Non-ownership—Collision	$100 Deductible
Members and Auxiliary Members on M.S.M.A. business under age 70	Travel Accident (away from home)	$25,000/250,000 $500 Medical Expense

Subject to the comments thereon, the attached statements, in our opinion fairly present the financial position of the Missouri State Medical Association at December 31, 1972 and the result of the activities for the year then ended. The records for the year were kept in accordance with accepted principles of accounting applied on a basis consistent with that of the preceding year.

Yours very truly,
Lennertson & Co.
Certified Public Accountants

FINANCIAL STATEMENT FOR THE YEAR 1972

LENNERTSON & COMPANY
Certified Public Accountants
ST. LOUIS, MISSOURI 63105

January 27, 1973

Missouri State Medical Foundation
515 East High Street
Jefferson City, Missouri 65101

Gentlemen:

The Balance Sheet of the Missouri State Medical Foundation, a nonprofit Missouri corporation, was examined for the year 1972. The Balance Sheet at December 31, 1972 is on a cash basis and the additions for the year are set forth in Exhibit A.

Recorded receipts for the year were traced in total into the bank account as deposits and paid checks were seen for the disbursements. A direct confirmation was received from the depository in verification of the cash balances on deposit.

A summary of the loans to medical students follows:

Loans Receivable January 1, 1972	$367,844.37
Loans made during the year	70,750.00
Total	$438,594.37
Less Loan Repayments	17,540.87
Loans Receivable December 31, 1972	$421,053.50

Positive confirmations were mailed as of August 31, 1972 by the Foundation on 226 individual loans which we had received positive confirmation in 1971. On 53 new loans and 10 loans not previously confirmed we mailed positive confirmations with requests to return the confirmations direct to the auditors. Of the 289 loans, 274 were confirmed for a total of $406,816.08 out of total loans of $421,053.50. No additional loans were made after August 31, 1972. Interest income on loans is recorded on a cash basis and the amount received in 1972 was $5,154.57. Accrued interest on outstanding loans at December 31, 1972 amounted to $32,221.46 and is not included in the loan balances in Exhibit A.

Interest received on the savings account and the certificate of deposit amounted to $1,753.28. The certificate of deposit due January 6, 1973 was renewed for six months and interest of $477.08 was received on that date.

The Foundation received a check on January 11, 1973 in the amount of $15,000.00 from the Dr. Richard S. Battersby Estate which represents a partial distribution of the bequest to the Foundation. It is anticipated that the Foundation will receive a total of $28,000.00 and the contribution will be recorded in the year received.

The Missouri State Medical Foundation paid expenses for the year ended December 31, 1972 as follows:

State Registration Fee	$ 1.00
Professional Fees	965.00
Surety Bond	52.66
Printing	170.20
Total	$1,188.86

Missouri State Medical Association had paid these expenses in prior years and continues to subsidize some of the Foundation expenses.

U. S. Treasury Department form 990 and Schedule A will be prepared for the year 1972 and are due for filing by May 15, 1973. The Foundation is not liable for Federal Income Taxes as it is classified as a Tax Exempt Charitable Organization. A refund claim has been filed for $216.16 taxes paid for the year 1970.

We have examined the Balance Sheet of Missouri State Medical Foundation as of December 31, 1972, prepared on the cash basis. The examination was made in accordance with generally accepted auditing standards and include such tests of the accounting records and such other auditing procedures as we considered necessary in the circumstances. Since the Balance Sheet is on the cash basis, no opinion is expressed on the attached statement as accrued interest on loans of $32,221.46 and $477.08 of accrued interest on certificate of deposit is not shown.

On September 21, 1971 the Foundation cancelled its life insurance on borrowers and became self-insured.

A reserve for losses on uncollectable loans and unpaid loans of deceased borrowers is being set up on the books at a rate of .05% of the outstanding monthly loan balances. An amount of $619.92 has been set up for 1971 and $2,450.35 for the year ended December 31, 1972. One uncollectable loan in the amount of $670.49 has been charged off against the reserve, leaving a balance of $2,399.78 at the year end. With the exceptions above, the Balance Sheet is prepared on a basis consistent with that of the preceding year.

Yours very truly,
Lennertson & Co.

CLASSIFIED ADS

O'FALLON PROFESSIONAL CENTER—O'Fallon, Missouri, offers an opportunity to start a new practice or relocate a stagnant one in the fastest growing area in the fastest growing county in the state, St. Charles County. Forty minutes from downtown St. Louis. New medical building to be completed in May. Over 1600 square feet available. Try it-You'll like it! Call Lawrence Bellon, D.D.S. (314) 272-5777 or (314) 227-7270.

$316,000 PRACTICE—By Board Surgeon and Board Internist, 55 and 53 years old. Both retiring. Excellent opportunity to continue this practice. Good hospital affiliations and completely equipped office in Kansas City, Mo. Write Box 381, Missouri State Medical Association, 515 E. High, Jefferson City, Mo. 65101.

URGENT NEED—For specialists in Pediatrics, OB-GYN, ENT, Orthopedics and General Practice. Opportunities group, Associate and solo practice. Drawing area over 60,000 population. 275 hospital beds. Write President, County Medical Society, Box 311, Hannibal, Mo. 63401.

IMMEDIATE CARE PHYSICIAN—No weekends or night call. $25,000 to start. One hour from Kansas City, Mo. Write Medical Director, Thompson, Brumm & Knepper Clinic, 902 Edmond St., St. Joseph, Mo. 64502.

WANTED—House physician on internal medical service. Monday through Friday, 8 to 5. Applicant must have Missouri license. Remuneration on basis of experience. Contact Dr. L. B. Harrison, 1755 South Grand, St. Louis, Mo. Phone 314-771-0500.

FOR SALE—Kansas City Area: Excellent clinic building suitable for large volume solo or small group practice. 20 min. to downtown K.C. Financing available. Write to Box 382, Missouri State Medical Association, Box 1028, Jefferson City, Mo. 65101.

GENERAL PRACTITIONER OR INTERNIST—Needed for part-time administrative medicine three to four hours a day. Attractive pay and working conditions. Please write to Box 383, Missouri State Medical Association, 515 East High, Jefferson City, Mo. 65101.

PEDIATRICIAN NEEDED—In Festus-Crystal City area. Will provide low cost new office space. Wonderful opportunity for full-time or second office. Contact Frank Callahan, c/o Central Rexall Drug, 1-314-937-3400.

SPECIALIST FAMILY PRACTICE—Generalist or surgeon. Town, 4000. 50 miles from Kansas City. Outstanding community. Large trade area. Airfield. Hospital. Radio. Good location for multiple specialty clinic. Brochure gives details. Large practice free. Long established. Retiring. Write Box 379, Missouri State Medical Association, 515 E. High, Jefferson City, Mo. 65101.

RADIOLOGIST—Board eligible, Diagnosis and Nuclear Medicine, 36, married, desires rural solo practice or association in Missouri. Write to Box 380, c/o Missouri State Medical Association, 515 E. High, Jefferson City, Mo. 65101.

EXCELLENT OPPORTUNITY—For board certified or board eligible anesthetist to locate in Kansas City, Mo. Call 816-923-9007 between 7 AM and 3:30 PM. St. Joseph Hospital.

DOCTOR'S PRACTICE—Grossing $65,000-$75,000 per year. Large home, separate apartment, complete office including equipment—entire package, $77,500. For more information, write R. E. Harland, M.D., 118 N. Main St., Ironton, Mo. 63650.

Missouri Medicine in Review

FORTY YEARS AGO

The Firmin Desloge Hospital in St. Louis opened its doors to patients on February 3. The hospital is the latest addition to the group of institutions affiliated with the St. Louis University School of Medicine. That hospital, which was constructed at a cost of $2,000,000, was made possible through a donation under the will of the late Firmin Desloge, lead magnate and former student at St. Louis University, and additional donations by the Desloge family. The building has 13 floors and is one of the most modern hospitals in the country. Its capacity is 238 beds, and a clinic provides facilities for the care of outpatients. The hospital is operated by the Sisters of St. Mary in association with the School of Medicine. Dr. Ralph A. Kinsella, chief-of-staff at St. Mary's Hospital, is chief-of-staff and director of the Department of Internal Medicine at the Firmin Desloge Hospital.

The Callaway County Medical Society met at the County Hospital in Fulton on January 12 with President C. H. Christian, Fulton, presiding. As retiring President, Doctor Christian delivered the annual address and officially announced names of officers for the next year. They are President, Dr. R. N. Crews; Vice-President, Dr. C. C. Ault; Secretary-Treasurer, Dr. A. D. Ferguson; Delegate to the MSMA, Dr. T. R. Frazer; and Alternate Delegate, Dr. C. H. Christian. All are of Fulton.

TWENTY-FIVE YEARS AGO

Braving below-zero weather, 17 physicians attended a joint dinner meeting of the Caldwell, Livingston, Carroll, Grundy-Daviess, Harrison, Linn, Mercer and Ray county medical societies in Chillicothe on January 22. The meeting was sponsored by the Grundy-Daviess County Medical Society. The severity of the weather failed to curb the enthusiasm of those present in their reception of the excellent program.

The South Central Counties Medical Society held a dinner meeting at the El Patio Hotel in Cabool on January 16. The following members and guests were present: Drs. R. W. Denney and A. C. Ames, Mountain Grove; Garrett Hogg, Jr., Cabool; J. R. Womack, Houston; Leslie Randall, Licking; C. F. Callihan, Willow Springs; E. C. Bohrer and Rollin H. Smith, West Plains; Harry D. Silsby and John P. Ferguson, Springfield; and T. J. Burns, Houston. Doctor Burns was voted a member of the Society.

The Scott County Medical Society met at the Sikeston General Hospital on December 17 with the following members present: Drs. W. O. Finney, Chaffee; E. D. Urban, H. B. Throgmorton, A. P. Sargent, T. C. McClure and A. D. Martin, Sikeston. Elected to serve in 1948 were Drs. A. P. Sargent, President; E. J. Nienstedt, Vice-President; and E. D. Urban, Secretary.

TEN YEARS AGO

On January 17, Dr. and Mrs. Jackson C. Moody, Harrisonville, were commissioned for Methodist Missionary service. Doctor Moody will do medical work in a Methodist hospital in India and Mrs. Moody will do educational work.

Seventy-five physicians from St. Joseph, Northwest Missouri, Northwest Kansas and Southeast Nebraska attended the January 9 meeting of the Buchanan County Medical Society in the Empire Room of Hotel Robidoux in St. Joseph. The speaker was I. S. Ravdin, M.D., president of the American Cancer Society and surgeon-in-chief and professor of surgery at the University of Pennsylvania Medical School. Doctor Ravdin discussed "Cancer of the Colon." Dr. John B. McDaniel presided at the meeting. Dr. Charles R. Willman, program chairman, asked Dr. Wilbur P. McDonald, who had studied under Doctor Ravdin, to introduce him as the speaker.

Dr. Sol Sherry, M.D., St. Louis, was one of ten medical men named recently to receive *Modern Medicine's* Distinguished Achievement Award for contributions which are directly influencing current medical practice and thought.

Librium® and (chlordiazepoxide HCl) concomitant us

College of Physicians
of Philadelphia, Library
19 South 22nd Street
Philadelphia 3, Pa. 19103
SAMPLE

Librium (chlordiazepoxide HCl) is used as adjunctive antianxiety therapy concomitantly with certain specific medications of other classes of drugs, such as cardiac glycosides, antihypertensive agents, diuretics, anticholinergics and antacids.

Antianxiety effectiveness: Demonstrated in a broad range of psychologic and physical dysfunctions; indicated when reassurance and counseling are not enough and until, in the phy judgment, anxiety has been reduced appropriate levels.

Effect on mental acuity: Usually proper maintenance dosage.

Safety: An excellent clinical rec use, the most common side effects re been drowsiness, ataxia and confusion, particularly in the elderly and debilitated.

in relief of clinically significant anxiety

Librium®
(chlordiazepoxide HCl)

5-mg, 10-mg, 25-mg capsules
up to 100 mg daily in
severe anxiety

Before prescribing, please consult complete product information, a summary of which follows:
Indications: Relief of anxiety and tension occurring alone or accompanying various disease states.
Contraindications: Patients with known hypersensitivity to the drug.
Warnings: Caution patients about possible combined effects with alcohol and other CNS depressants. As with all CNS-acting drugs, caution patients against hazardous occupations requiring complete mental alertness (*e.g.*, operating machinery, driving). Though physical and psychological dependence have rarely been reported on recommended doses, use caution in administering to addiction-prone individuals or those who might increase dosage; withdrawal symptoms (including convulsions), following discontinuation of the drug and similar to those seen with barbiturates, have been reported. Use of any drug in pregnancy, lactation, or in women of childbearing age requires that its potential benefits be weighed against its possible hazards.
Precautions: In the elderly and debilitated, and in children over six, limit to smallest effective dosage (initially 10 mg or less per day) to preclude ataxia or oversedation, increasing gradually as needed and tolerated. Not recommended in children under six. Though generally not recommended, if combination therapy with other psychotropics seems indicated, carefully consider individual pharmacologic effects, particularly in use of potentiating drugs such as MAO inhibitors and phenothiazines. Observe usual precautions in presence of impaired renal or hepatic function. Paradoxical reactions (*e.g.*, excitement, stimulation and acute rage) have been reported in psychiatric patients and hyperactive aggressive children. Employ usual precautions in treatment of anxiety states with evidence of impending depression; suicidal tendencies may be present and protective measures necessary. Variable effects on blood coagulation have been reported very rarely in patients receiving the drug and oral anticoagulants; causal relationship has not been established clinically.
Adverse Reactions: Drowsiness, ataxia and confusion may occur, especially in the elderly and debilitated. These are reve
ble in most instances by proper dosag
adjustment, but are also occasionally
served at the lower dosage ranges. In
few instances syncope has been repor
Also encountered are isolated instanc
skin eruptions, edema, minor menstr
irregularities, nausea and constipatio
extrapyramidal symptoms, increased
decreased libido—all infrequent and
generally controlled with dosage redu
tion; changes in EEG patterns (low-vol
fast activity) may appear during and a
treatment; blood dyscrasias (includin
agranulocytosis), jaundice and hepati
dysfunction have been reported occas
ally, making periodic blood counts an
liver function tests advisable during p
tracted therapy.
Supplied: Librium® capsules containi
5 mg, 10 mg or 25 mg chlordiazepoxi
HCl. Libritabs® tablets containing 5 m
10 mg or 25 mg chlordiazepoxide.

University of Missouri-Columbia Medical Center
SPECIAL ISSUE

Everybody experiences psychic tension.

Most people can handle this tension.

Some people develop excessive psychic tension and need your counse

and a few may need counseling
and the psychotropic action of Valium® (diazepam).

Before deciding to make Valium
zepam) part of your treatment
n, check on whether or not the
ient is presently taking drugs
l, if so, what his response has
n. Along with the medical and
ial history, this information can
p you determine initial dosage,
possibility of side effects and
ultimate prospects of success
ailure.

While Valium can be a most
pful adjunct to your counseling,
ould be prescribed only as long
xcessive psychic tension per-
s and should be discontinued
en you decide it has accom-
hed its therapeutic task. In
eral, when dosage guidelines
followed, Valium is well
rated (see Dosage). For con-
ience it is available in 2-mg, 5-mg
l 10-mg tablets.

Drowsiness, fatigue and ataxia
e been the most commonly re-
ted side effects.

Until response is determined,
ients receiving Valium should
cautioned against engaging in
ardous occupations requiring
nplete mental alertness, such
lriving or operating machinery.

ROCHE
Roche Laboratories
Division of Hoffmann-La Roche Inc.
Nutley, N.J. 07110

Before prescribing, please consult complete product information, a summary of which follows:

Indications: Tension and anxiety states; somatic complaints which are concomitants of emotional factors; psychoneurotic states manifested by tension, anxiety, apprehension, fatigue, depressive symptoms or agitation; symptomatic relief of acute agitation, tremor, delirium tremens and hallucinosis due to acute alcohol withdrawal; adjunctively in skeletal muscle spasm due to reflex spasm to local pathology, spasticity caused by upper motor neuron disorders, athetosis, stiff-man syndrome, convulsive disorders (not for sole therapy).

Contraindicated: Known hypersensitivity to the drug. Children under 6 months of age. Acute narrow angle glaucoma; may be used in patients with open angle glaucoma who are receiving appropriate therapy.

Warnings: Not of value in psychotic patients. Caution against hazardous occupations requiring complete mental alertness. When used adjunctively in convulsive disorders, possibility of increase in frequency and/or severity of grand mal seizures may require increased dosage of standard anticonvulsant medication; abrupt withdrawal may be associated with temporary increase in frequency and/or severity of seizures. Advise against simultaneous ingestion of alcohol and other CNS depressants. Withdrawal symptoms (similar to those with barbiturates and alcohol) have occurred following abrupt discontinuance (convulsions, tremor, abdominal and muscle cramps, vomiting and sweating). Keep addiction-prone individuals under careful surveillance because of their predisposition to habituation and dependence. In pregnancy, lactation or women of childbearing age, weigh potential benefit against possible hazard.

Precautions: If combined with other psychotropics or anticonvulsants, consider carefully pharmacology of agents employed; drugs such as phenothiazines, narcotics, barbiturates, MAO inhibitors and other antidepressants may potentiate its action. Usual precautions indicated in patients severely depressed, or with latent depression, or with suicidal tendencies. Observe usual precautions in impaired renal or hepatic function. Limit dosage to smallest effective amount in elderly and debilitated to preclude ataxia or oversedation.

Side Effects: Drowsiness, confusion, diplopia, hypotension, changes in libido, nausea, fatigue, depression, dysarthria, jaundice, skin rash, ataxia, constipation, headache, incontinence, changes in salivation, slurred speech, tremor, vertigo, urinary retention, blurred vision. Paradoxical reactions such as acute hyperexcited states, anxiety, hallucinations, increased muscle spasticity, insomnia, rage, sleep disturbances, stimulation have been reported; should these occur, discontinue drug. Isolated reports of neutropenia, jaundice; periodic blood counts and liver function tests advisable during long-term therapy.

Dosage: Individualize for maximum beneficial effect. *Adults:* Tension, anxiety and psychoneurotic states, 2 to 10 mg b.i.d. to q.i.d.; alcoholism, 10 mg t.i.d. or q.i.d. in first 24 hours, then 5 mg t.i.d. or q.i.d. as needed; adjunctively in skeletal muscle spasm, 2 to 10 mg t.i.d. or q.i.d.; adjunctively in convulsive disorders, 2 to 10 mg b.i.d. to q.i.d. *Geriatric or debilitated patients:* 2 to 2½ mg, 1 or 2 times daily initially, increasing as needed and tolerated. (See Precautions.) *Children:* 1 to 2½ mg t.i.d. or q.i.d. initially, increasing as needed and tolerated (not for use under 6 months).

Supplied: Valium® (diazepam) Tablets, 2 mg, 5 mg and 10 mg; bottles of 100 and 500. All strengths also available in Tel-E-Dose® packages of 1000.

Valium®
(diazepam)

To help you manage excessive psychic tension

Must vasodilators and therapy for other diseases come into conflict?

not if the vasodilator is

VASODILAN®

(ISOXSUPRINE HCl)

the compatible vasodilator... no treatment conflicts reported

The cerebral or peripheral vascular disease patient often has coexisting disease[1] which calls for another drug along with his vasodilator. It may be a hypoglycemic, miotic, antihypertensive, diuretic, anticoagulant, corticosteroid, or coronary vasodilator.

Vasodilan is not incompatible with any of these drugs—no treatment conflict has been reported. And, unlike other vasodilators, Vasodilan has not been reported to affect carbohydrate metabolism, liver function, or intraocular pressure—or to complicate treatment of diabetes, hypertension, peptic ulcer, glaucoma, or liver disease.

In fact, there are no known contraindications to the use of Vasodilan in recommended oral doses, other than that it should not be given in the presence of frank arterial bleeding or immediately postpartum.

1. Gertler, M. M., et al.: Geriatrics *25*:134-148 (May) 1970.

Indications: Based on a review of this drug by the National Academy of Sciences-National Research Council and/or other information, the FDA has classified the indications as follows:

Possibly Effective:

1. For the relief of symptoms associated with cerebral vascular insufficiency.
2. In peripheral vascular disease of arteriosclerosis obliterans, thromboangiitis obliterans (Buerger's Disease) and Raynaud's disea
3. Threatened abortion.

Final classification of the less-than-effective indications requires further investigation.

Composition: Vasodilan tablets, isoxsuprine HCl, 10 mg. and 20 mg.

Dosage and Administration: 10 to 20 mg. three or four times daily.

Contraindications and Cautions: There are no known contraindications oral use when administered in recommended doses. Should not be give immediately postpartum or in the presence of arterial bleeding.

Adverse Reactions: On rare occasions, oral administration of the drug s been associated in time with the occurrence of severe rash. When ras appears, the drug should be discontinued. Occasional overdosage effe such as transient palpitation or dizziness are usually controlled by reducing the dose.

Supplied: Tablets, 10 mg.—bottles of 100, 1000, 5000 and Unit Dose; 20 mg.—bottles of 100, 500 and Unit Dose.

Information for Contributors

Articles are accepted for publication on condition that they are contributed solely to this journal. Material appearing in Missouri Medicine is protected by copyright. Permission will be granted on request for reproduction in reputable publications provided proper credit is given and author gives permission.

Manuscripts should be typewritten, double spaced, and the original with one carbon copy submitted. Retain another carbon copy for proofreading. Used manuscripts are not returned. School and hospital appointments of the author should accompany the manuscript. It is desirable that a synopsis-abstract of approximately 135 words accompany the manuscript. References should be arranged at the end of the article in the order in which the references are cited in the text. The reference should give name of author, title of article, name of periodical, volume number, initial page number and year. Authors are responsible for reference accuracy.

Illustrations should be glossy prints or drawings in India ink on white paper. They should not be mounted and name of author and figure number should be penciled lightly on the backs. Legends should appear on a separate sheet. Colored illustrations will be used when suitable if author assumes the actual cost.

Legal difficulties may arise from unauthorized use of names, initials or photographs in which individuals can be identified. Permission should be secured from patient or legal guardian and signed duplicate or photostat submitted with such photographs or identification. The Editor and Editorial Board assume no responsibility for the opinions and claims expressed in articles contributed by authors. If citation of an institution related to the article is made, approval of the chief of service should be given in a letter accompanying the article.

Reprint order blanks will accompany proof, which will be sent to authors prior to publication.

All material other than scientific should be received prior to the first of the month preceding month of publication.

Please give notice of change of address at least one month in advance of the change, giving old and new addresses.

acute arthritic inflammation...heat that freezes

In acute rheumatoid arthritis consider Tandearil. The anti-inflammatory action of Tandearil quickly helps reduce heat, pain, swelling, and stiffness. Results are usually seen in 3 or 4 days. Try it for a week when the symptoms defy aspirin control.

Remember that Tandearil is not a simple analgesic. It should not be used on patients responding to routine therapy. Before using, please read the prescribing information. It's summarized below.

Tandearil® helps take the heat off

oxyphenbutazone NF

Geigy

Tablets of 100 mg.
Important Note: This drug is not a simple analgesic. Do not administer casually. Carefully evaluate patients before starting treatment and keep them under close supervision. Obtain a detailed history, and complete physical and laboratory examination (complete hemogram, urinalysis, etc.) before prescribing and at frequent intervals thereafter. Carefully select patients, avoiding those responsive to routine measures, contraindicated patients or those who cannot be observed frequently. Warn patients not to exceed recommended dosage. Short-term relief of severe symptoms with the smallest possible dosage is the goal of therapy. Dosage should be taken with meals or a full glass of milk. Patients should discontinue the drug and report immediately any sign of: fever, sore throat, oral lesions (symptoms of blood dyscrasia); dyspepsia, epigastric pain, symptoms of anemia, black or tarry stools or other evidence of intestinal ulceration or hemorrhage, skin reactions, significant weight gain or edema. A one-week trial period is adequate. Discontinue in the absence of a favorable response. Restrict treatment periods to one week in patients over sixty.
Indications: Acute gouty arthritis, rheumatoid arthritis, rheumatoid spondylitis.
Contraindications: Children 14 years or less; senile patients; history or symptoms of G.I. inflammation or ulceration including severe, recurrent or persistent dyspepsia; history or presence of drug allergy; blood dyscrasias; renal, hepatic or cardiac dysfunction; hypertension; thyroid disease; systemic edema; stomatitis and salivary gland enlargement due to the drug; polymyalgia rheumatica and temporal arteritis; patients receiving other potent chemotherapeutic agents, or long-term anticoagulant therapy.
Warnings: Age, weight, dosage, duration of therapy, existence of concomitant diseases, and concurrent potent chemotherapy affect incidence of toxic reactions. Carefully instruct and observe the individual patient, especially the aging (forty years and over) who have increased susceptibility to the toxicity of the drug. Use lowest effective dosage. Weigh initially unpredictable benefits against potential risk of severe, even fatal, reactions. The disease condition itself is unaltered by the drug. Use with caution in first trimester of pregnancy and in nursing mothers. Drug may appear in cord blood and breast milk. Serious, even fatal, blood dyscrasias, including aplastic anemia, may occur suddenly despite regular hemograms, and may become manifest days or weeks after cessation of drug. Any significant change in total white count, relative decrease in granulocytes, appearance of immature forms, or fall in hematocrit should signal immediate cessation of therapy and complete hematologic investigation. Unexplained bleeding involving CNS, adrenals, and G.I. tract has occurred. The drug may potentiate action of insulin, sulfonylurea, and sulfonamide-type agents. Carefully observe patients taking these agents. Nontoxic and toxic goiters and myxedema have been reported (the drug reduces iodine uptake by the thyroid). Blurred vision can be a significant toxic symptom worthy of a complete ophthalmological examination. Swelling of ankles or face in patients under sixty may be prevented by reducing dosage. If edema occurs in patients over sixty, discontinue drug.
Precautions: The following should be accomplished at regular intervals: Careful detailed history for disease being treated and detection of earliest signs of adverse reactions; complete physical examination including check of patient's weight; complete weekly (especially for the aging) or an every two week blood check; pertinent laboratory studies. Caution patients about participating in activity requiring alertness and coordination, as driving a car, etc. Cases of leukemia have been reported in patients with a history of short- and long-term therapy. The majority of these patients were over forty. Remember that arthritic-type pains can be the presenting symptom of leukemia.
Adverse Reactions: This is a potent drug; its misuse can lead to serious results. Review detailed information before beginning therapy. Ulcerative esophagitis, acute and reactivated gastric and duodenal ulcer with perforation and hemorrhage, ulceration and perforation of large bowel, occult G.I. bleeding with anemia, gastritis, epigastric pain, hematemesis, dyspepsia, nausea, vomiting and diarrhea, abdominal distention, agranulocytosis, aplastic anemia, hemolytic anemia, anemia due to blood loss including occult G.I. bleeding, thrombocytopenia, pancytopenia, leukemia, leukopenia, bone marrow depression, sodium and chloride retention, water retention and edema, plasma dilution, respiratory alkalosis, metabolic acidosis, fatal and nonfatal hepatitis (cholestasis may or may not be prominent), petechiae, purpura without thrombocytopenia, toxic pruritus, erythema nodosum, erythema multiforme, Stevens-Johnson syndrome, Lyell's syndrome (toxic necrotizing epidermolysis), exfoliative dermatitis, serum sickness, hypersensitivity angiitis (polyarteritis), anaphylactic shock, urticaria, arthralgia, fever, rashes (all allergic reactions require prompt and permanent withdrawal of the drug), proteinuria, hematuria, oliguria, anuria, renal failure with azotemia, glomerulonephritis, acute tubular necrosis, nephrotic syndrome, bilateral renal cortical necrosis, renal stones, ureteral obstruction with uric acid crystals due to uricosuric action of drug, impaired renal function, cardiac decompensation, hypertension, pericarditis, diffuse interstitial myocarditis with muscle necrosis, perivascular granulomata, aggravation of temporal arteritis in patients with polymyalgia rheumatica, optic neuritis, blurred vision, retinal hemorrhage, toxic amblyopia, retinal detachment, hearing loss, hyperglycemia, thyroid hyperplasia, toxic goiter, association of hyperthyroidism and hypothyroidism (causal relationship not established), agitation, confusional states, lethargy; CNS reactions associated with overdosage, including convulsions, euphoria, psychosis, depression, headaches, hallucinations, giddiness, vertigo, coma, hyperventilation, insomnia; ulcerative stomatitis, salivary gland enlargement.
(B)98-146-800-F (10/71)

more than sleep

YOUR CHOICE OF SLEEP MEDICATION IS WISELY BASED ON MORE THAN SLEEP-INDUCING POTENTIAL

Sleep with relative safety

Chronic tolerance studies have confirmed the relative safety of Dalmane (flurazepam HCl); no depression of cardiac or respiratory function was noted in patients administered recommended or higher doses for as long as 90 consecutive nights.

In most instances when adverse reactions were reported, they were mild, infrequent and seldom required discontinuance of therapy. Morning "hang-over" with Dalmane has been relatively infrequent. Dizziness, drowsiness, lightheadedness and the like have been the side effects noted most frequently, particularly in the elderly and debilitated. (An initial dose of Dalmane 15 mg should be prescribed for these patients.)

Sleep for 7 to 8 hours without need to repeat dosage during the night

No sleep medication has been as rigorously evaluated in the sleep research laboratory as Dalmane. Insomnia patients given one 30-mg capsule of Dalmane (flurazepam HCl) at bedtime, on average: fell asleep within 17 minutes, had fewer nighttime awakenings, spent less time awake after sleep onset, and slept for 7 to 8 hours with no need to repeat dosage during the night.

Sleep with consistency—no waning of therapeutic effectiveness

Over multiple nights of therapy, no waning of drug effectiveness was noted. There was consequently no need to increase dosage during the study periods. It stands to reason that the fewer repeat or incremental doses needed to sustain sleep, the
lower the total cost of the sleep med
cation. Consistent effectiveness is th
measure of Dalmane (flurazepam HC
economy.

When your evaluation of insomnia indicates the need for a sleep medication, consider Dalmane—a single entity nonnarcotic, nonbarbiturate agent proved effective and relativel
safe for relief of insomnia.

DALMANE®

(flurazepam HCl)

When restful sleep is indicated

One 30-mg capsule *h.s.*—usual adult dosage.
One 15-mg capsule *h.s.*—initial dosage for elderly or debilitated patients.

ROCHE

ROCHE LABORATORIES
Division of Hoffmann-La Roche Inc.
Nutley, New Jersey 07110

Before prescribing Dalmane (flurazepam HCl), please consult Complete Product Information, a summary of which follows:

Indications: Effective in all types of insomnia characterized by difficulty in falling asleep, frequent nocturnal awakenings and/or early morning awakening; in patients with recurring insomnia or poor sleeping habits; and in acute or chronic medical situations requiring restful sleep. Since insomnia is often transient and intermittent, prolonged administration is generally not necessary or recommended.

Contraindications: Known hypersensitivity to flurazepam HCl.

Warnings: Caution patients about possible combined effects with alcohol and other CNS depressants. Caution against hazardous occupations requiring complete mental alertness (*e.g.*, operating machinery, driving). Use in women who are or may become pregnant only when potential benefits have been weighed against possible hazards. Not recommended for use in persons under 15 years of age. Though physical and psych
dependence have not been report
recommended doses, use caution
ministering to addiction-prone ind
or those who might increase dosag

Precautions: In elderly and debilit
initial dosage should be limited to
to preclude oversedation, dizzines
or ataxia. If combined with other d
having hypnotic or CNS-depressa
effects, consider potential additive
Employ usual precautions in pati
who are severely depressed, or wi

pression or suicidal tendencies. blood counts and liver and kidtion tests are advised during therapy. Observe usual precauresence of impaired renal or unction.

Reactions: Dizziness, drowsitheadedness, staggering, ataxia g have occurred, particularly or debilitated patients. Severe lethargy, disorientation and obably indicative of drug intolerverdosage, have been reported.

Also reported were headache, heartburn, upset stomach, nausea, vomiting, diarrhea, constipation, GI pain, nervousness, talkativeness, apprehension, irritability, weakness, palpitations, chest pains, body and joint pains and GU complaints. There have also been rare occurrences of sweating, flushes, difficulty in focusing, blurred vision, burning eyes, faintness, hypotension, shortness of breath, pruritus, skin rash, dry mouth, bitter taste, excessive salivation, anorexia, euphoria, depression, slurred speech, confusion, restlessness, hallucinations, and elevated SGOT, SGPT, total and direct bilirubins and alkaline phosphatase. Paradoxical reactions, *e.g.,* excitement, stimulation and hyperactivity, have also been reported in rare instances.

Dosage: Individualize for maximum beneficial effect. *Adults:* 30 mg usual dosage; 15 mg may suffice in some patients. *Elderly or debilitated patients:* 15 mg initially until response is determined.

Supplied: Capsules containing 15 mg or 30 mg flurazepam HCl.

MSMA NEWS ROUND-UP

APRIL, 1973

View of Governor's Mansion and State Capitol

MSMA expected to occupy new Headquarters by May 1

The Governor's Mansion (right in above photo) and State Capitol Building are within easy walking dis- ce from the recently purchased Headquarters Build- of the Missouri State Medical Association in Jef- on City.

Taken from the second floor of MSMA's new home, photograph locates the MSMA office in the heart Jefferson City's governmental complex. Also, the y Parking Garage is only one-half block away.

Remodeling work is nearing completion and occu- icy is expected by May 1, 1973.

The Headquarters is an historic site in Jefferson y. It was built in 1871 by B. Gratz Brown, 20th Gov- or of Missouri. The interior of the building is be- completely remodeled while the exterior is being tored to resemble its original appearance. The ucture, located at 113 Madison Street, is situated an area of the city which has undergone extensive toration in the past few years.

The Headquarters location should be convenient to MA members visiting the Capital City and all mem- s are urged to stop in and see the offices.

The accompanying map shows access routes to MA Headquarters.

Senators push for RMPs

Fifteen U.S. Senators, including Sen. Thomas Eagleton of Missouri, have introduced legislation which would continue Regional Medical Programs until June 30, 1974.

Missouri Regional Medical Program and BiState Regional Medical Program, along with all other RMPs in the nation, have been ordered by the Washington office to make plans for closing out operations by June 30, 1973.

The proposed legislation would extend for one year the life of RMPs and 40 other federal health programs while each program's effectiveness is examined. President Nixon has urged Congress not to renew enabling legislation for RMPs and the other programs.

Medicare reports open to publi

All Medicare surveys and investigative reports mad
ter Jan. 31, 1973, will be open to the public.

New regulations will make available reports on
ciencies found in state surveys of hospitals, skilled nu
homes, home health agencies and independent laborat
performance evaluations on carriers, intermediaries
state agencies; performance reports on providers an
names of physicians and providers found to have
charged or convicted of submitting false claims.

Subjects of reports or surveys will have 30 days to
mit statements before the reports are released.

In the case of physicians and providers found by
mediaries to have charged excessively, names will
leased only after consultation with a professional m
society and after the person has had a chance to respon
cording to the Social Security Administration.

Columnist accuses NBC of bias on 'What Price Health?

Editor's Note

Although NBC has refused to grant equal time to the AMA to answer false accusations and to correct misinformation aired in the program, "What Price Health?," several newspaper columnists have taken up the battle. The following column by James J. Kilpatrick of the Washington Star Syndicate, Inc., is indicative of many such columns which have been published.

By JAMES J. KILPATRICK

WASHINGTON.—On December 19 of last year, NBC broadcast a documentary, "What Price Health?". On January 10, Dr. Ernest B. Howard, executive vice president of the American Medical Association, strongly complained to NBC of bias and distortion in the program; he asked for equal time to reply. On February 12, NBC responded to Dr. Howard by denying the charges, defending the show, and refusing equal time.

The exchange of correspondence is instructive. Viewed simply in terms of its subject matter, the NBC documentary offered an excellent example of what television ought to be doing: The quality of health care in the United States clearly is a matter of national concern. The subject ought to be examined, and it ought to be examined critically.

At the same time, it ought to be examined fairly. That is what a "documentary" is all about. Such a work is not intended as a work of advocacy or opinion, but as a work of fact. If documentaries are to live up to their billing, they should present evidence not on one side only, but on both sides.

* * *

THIS NBC FAILED to do. The producers of "What Price Health?" set out to make a case that American medicine is poor, that doctors are unduly rich, that patients who can't pay for medical care are likely to die for want of it, and so on. Under a flimsy veil of neutrality, the network made that case. Its writers picked case histories to support their view; they picked statistics that would adorn their presentation, and they rejected statistics that might have given a different picture. Then they put it all together, gave Ed Newman a script to read, and called it a "documentary." What it was, was an editorial.

For example, the program had Newman saying, "Good health care is hard to find." That is an editorial judgment. Hard, one might as, compared to what? As Dr. Howard pointed out, documenting his statement, 2,300,000 persons a day manage to see a physician. "The U.S. Public Health Service," Dr. Howard continues, "says that the nearest doctor is only 17 minutes from the average doorstep, and in 1969 (the last year for which data are available), 20 million house calls were made, more than half of them to families with under $3,000 annual income, the elderly, or the handicapped."

For a second example, the program had Newman sa
"If you go to an emergency ward, the average wait i
hours — and 14 hours is not unusual." That purports t
statement of fact. It was not documented. Dr. Howard
knows the meaning of documentation, replies: "The
Public Health Service found in its survey that peopl
phoned an emergency room for an appointment had t
an average of 28.7 minutes; those with no appointment
eight minutes longer."

To prove the poor quality of medical care, the NBC
mentary relied upon figures showing that 10,000 malp
suits were filed in 1970. The statement may be true —
less the suits were filed — but it is not the whole tr
Public Health study turned up 6,160 malpractice suit
year in which payments were made. The figure was tw
hundredths of one per cent of the number of hospit
charges.

* * *

NBC USED OTHER STATISTICS, taken from
Nations sources, to show that health care in the U.S.
as compared to other nations. But the Demographi
book itself cautions against such comparisons. Sta
data are not uniform, nation by nation. Neither are li
necessarily comparable.

The network spokesman, Executive Vice Pre
Richard C. Wald, refuses to admit the slightes
on NBC's part. He sees the show as "an honest,
right statement well within the bounds of resp
journalism." One of the witnesses on the progra
Alex Gerber, sees it differently: "Had I known
vance that NBC planned a highly biased and di
view of medical care in this country, I would
have consented to be a part of it."

Copies of the correspondence may be obtaine
the AMA, at 535 Dearborn St., in Chicago. The
provide documentation, if you please, of what t
tics often have in mind.

"(C) 1973. The Washington Star Syndicate, Inc."

Several State Legislators have bee
quoted recently as saying they are re
ceiving more mail this season from thei
constituents concerning proposed law
than ever before.

Physicians should remember that
letter or telephone call to their lawmaker
CAN carry impact. Letters should be ac
dressed to the individual State Represent
tive or Senator at the State Capitol Buil
ing, Jefferson City, Mo. 65101.

A Review of 1972-1973

University of Missouri-Columbia Medical Center

"One Century and We've Just Begun"

By

WILLIAM D. MAYER, M.D.
Director of the Medical Center
Dean of the School of Medicine

It is most appropriate that the review of this past year be subtitled "One Century and We've Just Begun" for during this year we are celebrating the centennial anniversary of the University of Missouri School of Medicine. Although we are only 17 years old as the currently existing four-year school, this institution does have a rich heritage of educational service to the state, dating back to the founding of the preexisting two-year school in 1872. The University of Missouri-Columbia Medical Center, thus, is a unique combination of an institution with an enviable, proud heritage and one containing the vitality of a major medical center in its adolescence. Although there is no way in a single brief article to review all or even the most significant events of the previous year, I hope that those selected will provide the reader with some flavor of the developing scope of services in patient care, education and research which the Medical Center is providing to the citizens of the state of Missouri. Those of us working in the Center do sense this unusual combination of "the old and the new" and believe that this centennial year does represent "One Century and We've Just Begun."

Patient Care

Of the multiple advances that occurred in the provision of patient care services for Missourians at the Medical Center during this past year, I will mention only five: (1) The opening of the VA Hospital (Fig. 1), (2) the establishment of the Primary Care Program, (3) the expansion of our rehabilitation center, (4) the opening of the Arthritis Center and (5) improvements in the University Hospital.

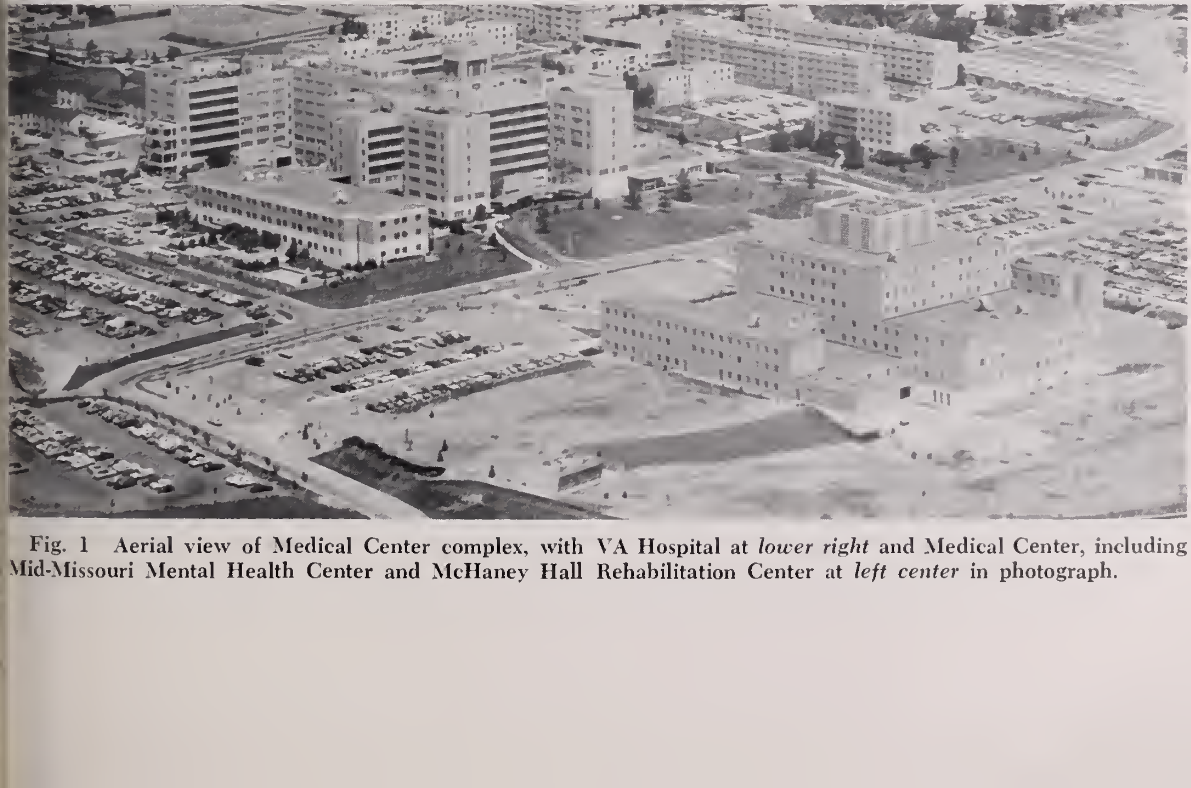

Fig. 1 Aerial view of Medical Center complex, with VA Hospital at *lower right* and Medical Center, including Mid-Missouri Mental Health Center and McHaney Hall Rehabilitation Center at *left center* in photograph.

1. In April, 1972, the long-awaited Veterans Administration Hospital accepted its first patient. Since that time, 286 beds of this 460-bed facility have been activated. It is anticipated that by July, 1974, the remainder of the hospital will be opened. This facility immediately adjacent to the Medical Center (Fig. 1) and connected to it by a tunnel beneath Stadium Road is proving to be an important resource to Missouri veterans requiring sophisticated medical treatment. It has become an integral part of the patient care, education and research activities of the Medical Center. All physicians appointed to the VA are also joint appointees of the faculty of the School of Medicine, and most serve part-time on "both sides of the street." In order to avoid needless duplication of expensive equipment and personnel, arrangements have been developed with the VA to share programmatic efforts. Thus, for example, some laboratory determinations for the entire Medical Center Complex are carried out in the VA while others are carried out only within the University Hospital.

The VA also has enabled us to expand significantly the internship and residency programs of the Center thereby providing postgraduate training to an increased number of M.D.'s, a majority of whom will practice in Missouri. It also provides an enlarged clinical base for our expanded educational programs for medical, nursing and allied health students. Finally, it has provided an opportunity to expand the clinical research activities of the Center.

2. During the year, the Family Medical Care Program was opened to provide comprehensive care to families in the greater Columbia community. This multidisciplinary effort is providing services of health maintenance and early disease detection as well as the treatment of acute and chronic illnesses of the family members participating in the program. It will serve as a major focus for expanding the residency program in Family Practice as well as a resource for students learning about primary care.

3. Construction began this past fall on a $1 million project which will renovate and add a six-story addition to McHaney Hall. This will form the focal point for improving and expanding the services in rehabilitation which we provide to the citizens of the state. The project was made possible by grants of $100,000 from the Seeing Eye Foundation of Morristown, N. J. and $900,000 from the Missouri State Section of Vocational Rehabilitation, Department of Health Education and Welfare, as well as contributions from many private donors.

On the basis of this development and the potential for rehabilitation activities within the Veterans Administration Hospital, the School was able to recruit Charles R. Peterson, M.D. as Professor and Chairman of the Department of Physical Medicine and Rehabilitation. Dr. Peterson will join the Center in June and have responsibility for the expansion of our patient care, education and research functions in Physical Medicine and Rehabilitation. Dr. Peterson comes to us from his current roles on the staff of the Methodist Hospital and the Texas Institute for Rehabilitation and Research in Houston, Tex. and as Associate Professor in the Department of Physical Medicine and Rehabilitation at Baylor University College of Medicine.

These developments will enable us not only to expand our rehabilitation services but, also, our residency program in PM&R and our other educational programs in rehabilitation: physical therapy, occupational therapy, vocational rehabilitation, recreational therapy, counseling psychology and speech therapy.

4. Also during this year, the opening of the University of Missouri-Columbia Arthritis Center was made possible by funds solicited by the Arthritis Advisory Council, comprised of 36 prominent Mid-Missouri citizens and chaired by Dr. Elmer Ellis, MU President-Emeritus. This Center, constituting a special unit where arthritis patients can benefit from care provided by a team of specialists, also represents a focal point for education of health professional students studying the nearly 100 different conditions that manifest themselves as arthritis. Further, it offers opportunities for research activities of a group of several specialists in the Center who are interested in clinical research leading to improved therapeutic modalities for these patients.

5. As I reported in my April, 1972 article for Missouri Medicine (devoted entirely to the University Hospital), two major studies of the Hospital, its structure and functions, were then under way. The reports of those efforts were completed, and we are now in the process of implementing their recommendations in order to enhance even further the quality and efficiency o our hospital services. In that the list is to lengthy to include all the changes which are i the process of implementation, I will mentio only those which might be of particular interes to the physicians of the state who utilize th services of the Hospital:

a. *Director*—On August 1, Joe S. Greathous assumed responsibility as the Director of th University Hospital. Director of the Vanderbil University Hospital in Nashville for five year prior to coming to Columbia, he brings to our University the skills of one of the best known and most highly respected teaching hospital administrators in this country.

b. *Referral Policy*—The Board of Curators in September approved a change in the referral policy of the University Hospital which permits the Hospital to accept patients not only through referral by physicians but, also, on referral by other health agencies and organizations and by direct request of the patients themselves. This has permitted greater utilization of the capabilities of the University Hospital by the citizens of the state.

c. *Communications*—Steps are being taken to improve the ease with which referring physicians and patients can contact the physicians of the Center. In June, the Medical Center went on a new Centrex telephone system enabling anyone outside the Medical Center to call directly the desired department or a specific physician. In July, we mailed to all the physicians of the state an updated copy of guidelines for referring patients, including the names of physicians by department and their new numbers. This mailing will be updated annually. We are now in the final stages of developing an internal radio-paging system so physicians can be reached anywhere in the Medical Center when they are away from their offices. These steps should go a long way toward solving communication problems which are inherent in a complex center such as this one.

d. *Air-Conditioning*—One of the major defects of the University Hospital has been that major portions of it are not air-conditioned. The University has given top priority to this matter. Contained within its current request to the Legislature is $2.1 million to complete the air-conditioning and to carry out some other much needed renovations in the Hospital and the Clinics. We hope that this session of the Legislature will approve the expenditure of these funds.

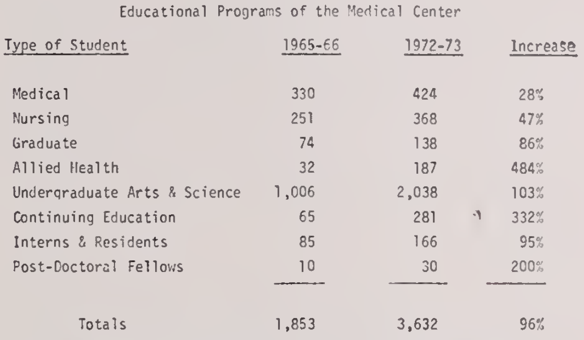
e. *Parking*—Two parking lots in the immediate proximity of the University Hospital and the Outpatient Clinics are now reserved for the parking of patients' and visitors' vehicles to improve their access to the Center.

These five steps and the many more which have been taken or are under way will improve the capacity of the University Hospital to serve the citizens and physicians of the state.

EDUCATION

As the largest single producer of health manpower for the state of Missouri, the Medical Center has continued to expand its educational programs within the limits of available resources. Last May, 98 M.D. degrees were granted to the first class representing the increase from a first-year enrollment of 85 to 100. In August, another 10% increase in medical school entering-class size was accomplished with an entering class of 110.

Fig. 2, prepared for a recent accreditation site visit to the School of Medicine by the Liaison Committee on Medical Education, shows the changes in student enrollment in the seven-year period since our last accreditation. During that time, the number of students we have been teaching has almost doubled. Of particular note is the dramatic increase in allied health students. Seven years ago, we had only a limited number of students enrolled in three small programs in medical technology, physical therapy and nutrition and dietetics. We have now expanded those programs and added baccalaureate programs in occupational therapy, radiologic technology and respiratory therapy. These figures are even more remarkable when one realizes that they represent only those students in their final two years of training in these programs, for which the Medical Center is responsible. Actually, approximately 400 students are involved when we include those who are in other schools and colleges of the University for their preprofessional training.



Educational Programs of the Medical Center

Type of Student	1965-66	1972-73	Increase
Medical	330	424	28%
Nursing	251	368	47%
Graduate	74	138	86%

Post-Doctoral Fellows	10	30	200%
Totals	1,853	3,632	96%

Fig. 2 Student enrollment in health sciences.

A special note also should be made concerning the increased efforts in the continuing education of health professionals, in which our faculty is participating not only in Columbia but throughout the state. The 281 figure is even more impressive when one realizes it is represented in terms of *full-time* equivalent students; in actual fact, it constitutes more than 84,000 student contact hours of continuing education for physicians, nurses and allied health personnel.

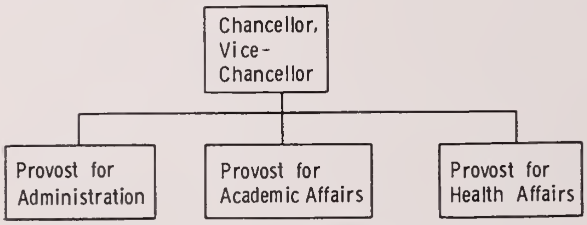
In addition to the increase in size of educational programs, there has been a corresponding increase in the *quality* of our educational offerings and the quality of our entering students. The latter is present throughout the total spectrum of entering students, but it is dramatically in evidence in the School of Medicine where the number of Missouri resident applicants has increased from 216 for the class entering in 1965 to 570 who applied for this year. This trend is continuing with 700 Missouri applicants to date for the class entering in 1973 and preliminary data which suggests that there are even more Missouri premeds in the pipeline. This trend has challenged the Medical School admission process and complicated the life of the Dean who must explain to various individuals why certain students were not accepted. However, it can only assure an ever-increasing quality of individuals entering our profession.

RESEARCH

This year, as has been the case for the past several years, research support received by our faculty from the federal government, foundations and other sources external to the University has continued to increase. Because this has occurred at a time when competition for research funds nationally has become more rigorous than ever before, it indicates an increasing national recognition of our faculty. Laboratory and clinical research ranges from studies on the molecular basis of disease to studies in preventive, rehabilitative and therapeutic medicine. A representation of the wide range of the hundreds of research projects now carried out within the Center (and their potential value to the state of Missouri) is contained in the following two examples of grants funded during this past year.

In September, we received five-year approval not only for the continued funding but for the expansion of the activities in our General Clinical Research Center with an award to fund it at an annual rate of approximately $350,000. More than 1,500 patients have been admitted to the Clinical Research Center during the past five years and have participated in such diverse projects as studies of the natural history of diabetes mellitus and effects of various types of therapy; hemodynamic assessment of surgical procedures for hypertension; effects of trace metals on vascular disease; relations of the renin-angiotensin-aldosterone system to human hypertension; metabolic effects resulting from bowel bypass procedures for obesity; effects of various chemotherapeutic programs on the molecular biology of tumors; and other studies. The CRC provides not only mechanisms for assuring future improved health care for Missourians, as a result of its research findings, but also provides opportunities for medical students and house officers to see at firsthand high quality clinical research so they will be better prepared to interpret clinical research findings in the literature in the future.

Another research grant awarded this year involves study of factors affecting distribution of physicians in rural Missouri. This study by individuals in rural sociology, medical sociology and medical faculty will attempt to determine the factors in individual student's and physician's backgrounds and educational experiences which influence their selection of career choices in medicine in both specialty and geographic location. Data developed from these studies should be extremely helpful to the Medical Center in our attempts to increase the number of physicians practicing in rural Missouri.



Chancellor, Vice-Chancellor
Provost for Administration
Provost for Academic Affairs
Provost for Health Affairs

Fig. 3 Reorganization of Chancellor's Office.

ADMINISTRATION

Two major reorganization proposals approved by the University's Board of Curators at its September meeting directly affect the University Medical Center. The first proposal established a reorganization of the Chancellor's office and the second a reorganization relating to health affairs on the Columbia campus.

The diagram in Fig. 3 depicts the new organization of the Chancellor's office.

A new position of Vice-Chancellor has been created, along with positions for three provosts (administration, academic affairs and health affairs). The Chancellor and these four individuals will constitute the major central administrative group for the University of Missouri-Columbia. The inclusion of health affairs activities within the executive staff of the Chancellor clearly acknowledges recognition by the administration that education, service and research in the health area constitute a key role in University affairs.

Dr. Walter Daniel, former President of Lin-

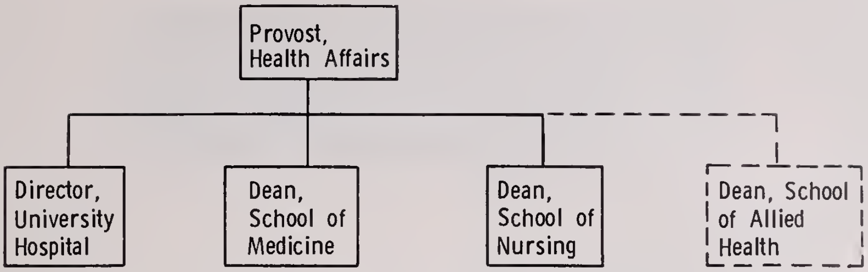


Fig. 4 Reorganization of Health Affairs.

coln University, has been appointed Vice-Chancellor and Dr. John F. McGowan, formerly Dean of Extension, has been appointed Provost for Administration.

In October, the Chancellor appointed a ten-member Search Committee, headed by Dr. McGowan, to help select a Provost for Health Affairs. The Committee was charged "to identify at least four candidates who, in the judgment of the full committee, are fully qualified for the position of Provost for Health Affairs, and advise the Chancellor regarding their qualifications, it being understood that at least two of the candidates shall be affiliated with programs in institutions other than the University of Missouri." At this writing, the Committee is continuing its efforts.

Another Search Committee is currently considering candidates for Provost for Academic Affairs.

The second reorganization plan approved by the Curators relates to the Health Affairs activities on the Columbia campus. That reorganization is depicted by the diagram in Fig. 4.

As previously mentioned, Joe S. Greathouse, formerly Director of Vanderbilt University Hospital, was appointed Director of the University Hospital.

Dr. Ruby Potter, Associate Dean of the School of Medicine in charge of the School of Nursing, is due to retire in September, 1973. Thus, a Search Committee for her replacement had been appointed prior to approval of the reorganization. That Committee, which I chair, is currently reviewing candidates for the Deanship of the School of Nursing.

The Chancellor has appointed a campus-wide committee to review the possibilities of the establishment of a School of Allied Health. If a school is developed, a Search Committee for that Dean will be implemented to fit into the organizational structure outlined above.

I feel that both of these are significant steps forward in the orderly growth and development of the Medical Center and health affairs on the Columbia campus. The current administrative structure is simply no longer applicable to an activity of the size and complexity of the Medical Center.

Another important administrative step was taken on December 15, 1972 with the appointment of Giulio J. Barbero, M.D., nationally known for his work in pediatric gastroenterology and nutrition research for children, as Chairman for the Department of Pediatrics. For the past six years, Dr. Barbero has been Chairman of Pediatrics at Hahnemann Medical College in Philadelphia where he was President of the Philadelphia Pediatrics Society. He replaces Dr. Robert L. Jackson, who has been Chairman since the establishment of the four-year school in 1956. Dr. Jackson will remain as Professor in the Department, concentrating on his primary interest in diabetic children.

CONCLUSION

It is, of course, not possible to review in so brief an article all of the important "happenings" of the university medical center in the course of a year. I have outlined a few of them. I hope this is sufficient to illustrate for the reader some of the progress and pride felt by the author. In this, the centennial year of Missouri's School of Medicine, the motto "One Century and We've Just Begun" seems to be appropriate. I am extremely proud of the accomplishments of our academic and nonacademic staff during this past year as they have met the many patient care, educational and research responsibilities presented to them.

Please feel free to contact me if you feel there are specific ways in which we can continue to improve our efforts. For, in the final analysis, it is only with your advice, counsel and support that we can continue to serve the purpose to which we are all dedicated—the health needs of the citizens of the state of Missouri.

WASHINGTON

The American Medical Association took to Congress its protest against retention of controls over physicians in phase III of the economic stabilization program.

In a statement to the Senate Committee on Banking, Housing and Urban Affairs, which was considering a one-year extension of statutory authority for the program, the AMA cited the "highly discriminatory" treatment of physicians and other health care providers under the program despite their cooperation and "laudable record of self-restraint."

"We have questioned the wisdom of many of the policies which have been initiated in the various regulatory phases since August of 1971," the AMA statement said. "In particular, we have objected to certain aspects because of the highly discriminatory treatment accorded health care providers. This discrimination has been even heightened under phase III of the Administration's program. On Jan. 11, 1973, mandatory wage and price controls were suspended for most sectors of the economy but were continued to be enforced upon health care providers. Our opposition to this discrimination does not stem from self-interest, nor is it based solely upon invidious comparison with those segments of the economy no longer subject to mandatory control. The question we raise here is more fundamental. It is submitted that the capricious imposition of controls on select groups only serves to frustrate the basic objectives of the stabilization program itself. If regulation is to be effective, it must recognize the interrelationships existing within the economy in general. Without such accomplishment the intent of the law will be frustrated.

"Physicians' fees constitute a relatively small percentage of the gross national product (less than 1.5%) and they constitute a small factor in the consumer price index weighting structure (less than 1.8%). Given the relatively slight impact of this factor upon the economy as a whole, the suspension of mandatory controls would not work counter to the goals of the economic stabilization program. Conversely, continued controls could not be expected to yield meaningful restraints throughout the balance of the economy. The continuation of mandatory controls, therefore, does not appear to be consistent with the letter or spirit of the economic stabilization act.

"The Congress found in enacting the economic stabilization act that prompt judgments and actions by the executive branch of the government were necessary to meet extreme economic fluctuations. The Congress, however, directed the president to conduct such emergency programs in a fair and equitable manner and to make such adjustments as may be necessary to prevent gross inequities. Standards established under an emergency program must comply with the criteria of section 203 (b) of the act which provides, among other things, that such standards shall be 'generally fair and equitable' and that the program must call for 'generally comparable sacrifices by business and labor as well as other segments of the economy.'

"We emphasize that this statutory authority presumes the existence of an economic emergency and authorizes a coherent and comprehensive governmental response. Only a system of price stabilization effective at all levels of production and consumption and having equitable incidence within the economy should be countenanced. To invoke controls for one activity without the reasonable expectation of achieving a result having universal application is to employ the statute in a punitive manner. Punitive treatment of health care professionals is neither sanctioned by law nor warranted by the record.

"It is apparent from the physician component of the consumer price index that the medical community has fully complied with efforts to curb inflation during phase I and II of the new economic policy. In the period from August, 1971 to December, 1972, the all items category, as measured by the consumer price index, rose at a rate of 4.2%, the all services component at the rate of 4.6%, while physicians' fees rose only 3.2%. In the period from November, 1971 to December, 1972 (i.e., during the 14 months of phase II), the all items category rose 3.8%, the price of all services rose at a rate of 3.8% while physicians' fees rose at a rate of 2.6%. For the calendar year 1972, physicians' fees increased only 2.1%. This percentage is below the 2.5% annual goal set by the Health Services Industry Committee of the Price Commission and represents a rate of increase of only one third the rate of increase prior to phase I. Since the goal of the economic stabilization program was to halve the rate of inflation, the record achieved by physicians surpassed considerably the expectations of the program. Thus, there is no indication that physicians' fees have been a major inflationary factor during the course of the stabilization program, and it is difficult to discern any rationale for imposing mandatory controls in this sector. Continued controls do not appear to be the just reward for this record of compliance. We submit that this precedent could have a demoralizing effect on other industries which might well conclude that a record of restraint does not preclude imposition of a continued regimen of control. . . .

"All activities require the basic factors of production, and all of us must compete in the marketplace for these necessary goods and services. It will become increasingly difficult for the health care services to obtain needed material and manpower unless the stabilization program is administered in a nondiscriminatory fashion."

AMA Congress on Medical Ethics to Be Held on April 26-28 in Washington

The Judicial Council of the American Medical Association has announced that the Fourth National Congress on Medical Ethics will be held on April 26-28 at the Washington Hilton Hotel in Washington, D. C.

Distinguished speakers and panelists will discuss ethical issues of growing concern to medical professionals and society from the more traditional, such as fee splitting and solicitation, to the more current, such as genetic engineering and behavior control.

Among the specific subjects to be discussed will be "What Is Medical Ethics?," "How Does the Student or the Resident or the Nurse See Medical Ethics?," "The Teaching of Medical Ethics," "Medical Ethics and the New Biology" and "Voluntarism vs. Compulsion."

What Missouri doctors need is a **Malpractice Liability Carrier** that won't fade when trouble comes.

Pinworm therapy is often a family affair

Contraindications: History of hypersensitivity to thiabendazole.
Warnings: If hypersensitivity reactions occur, drug should be discontinued immediately and not resumed. Rarely, erythema multiforme has been associated with thiabendazole therapy; in severe cases (Stevens-Johnson syndrome), fatalities have occurred. Because CNS side effects may occur quite frequently, activities requiring mental alertness should be avoided. Safe use in pregnancy or lactation has not been established.
Precautions: Ideally, supportive therapy is indicated for anemic, dehydrated, or malnourished patients prior to initiation of anthelmintic therapy. In presence of hepatic or renal dysfunction, patients should be carefully monitored.
Adverse Reactions: Most frequently encountered are an
nausea, vomiting, and dizziness. Less frequently, diarrhe
epigastric distress, pruritus, weariness, drowsiness, gid
and headache have occurred. Rarely, tinnitus, hyperirrita
numbness, abnormal sensation in eyes, blurring of visio
xanthopsia; hypotension, collapse; enuresis; transient ri
cephalin flocculation and SGOT; perianal rash, cholestas
parenchymal liver damage; hyperglycemia; transient leu
malodor of the urine, crystalluria, hematuria; appearanc
Ascaris in the mouth and nose. Hypersensitivity reactio

A New Dosage Form:

Chewable Tablets 500 mg Mintezol®

(THIABENDAZOLE | MSD)

So easy to take everyone in the family can keep to the egimen you prescribe

clude: fever, facial flush, chills, conjunctival injection, ngioedema, anaphylaxis, skin rashes, erythema multiforme ncluding Stevens-Johnson syndrome), and lymphadenopathy. **upplied:** Chewable tablets, containing 500 mg thiabendazole, boxes of 36, strip packaged, individually foil wrapped; uspension, containing 500 mg thiabendazole per 5 cc, in ottles of 120 cc.

DOHME

INDICATION | DOSAGE SCHEDULE

MINTEZOL® (Thiabendazole, MSD) has demonstrated effectiveness against a broad spectrum of nematode infections. Dosages are weight related. For your convenience, the information in the weight-dose chart below is included in the full prescribing information and in the 1973 edition of PDR.
The recommended maximum daily dose of MINTEZOL is 3 g (6 tablets).
MINTEZOL should be given after meals if possible. Dietary restriction, complementary medications, and cleansing enemas are not needed.
The usual dosage schedule for all conditions is two doses per day. The size of the dose is determined by the patient's weight.

Weight-dose chart:

WEIGHT (lb)	EACH DOSE (g)	TABLETS
25	0.25	½
50	0.5	1
75	0.75	1½
100	1.0	2
125	1.25	2½
150 & over	1.5	3

The regimen for each indication follows:

INDICATION	REGIMEN	COMMENTS
Pinworm disease	Two doses per day for 1 day. Repeat in 7 days. This regimen is designed to reduce the risk of reinfection.	If this is not practical, give 2 doses per day for 2 successive days.
Threadworm,* large roundworm,* hookworm,* and whipworm* disease	Two doses per day for 2 successive days.	A single dose of 20 mg/lb or 50 mg/kg may be employed as an alternative schedule, but a higher incidence of side effects should be expected.
Creeping eruption	Two doses per day for 2 successive days.	If active lesions are still present 2 days after completion of therapy, a second course is recommended.
Symptoms of trichinosis* during the invasive phase of the disease	Two doses per day for 2 to 4 successive days according to the response of the patient.	The optimal dosage for the treatment of trichinosis has not been established.

*Clinical experience with thiabendazole for treatment of each of these conditions in children weighing less than 30 lb has been limited.

Antivert®
(meclizine HCl)
for vertigo*

tivert® (meclizine HCl) has been found
ful in the management of vertigo associ-
d with diseases affecting the vestibular sys-
a. It is available as Antivert (12.5 mg.
clizine HCl) and Antivert/25 (25 mg.
clizine HCl) scored tablets for conven-
ce and flexibility of dosage. Antivert/25
mg. meclizine HCl) Chewable Tablets
available for the management of nausea,
niting, and dizziness associated with mo-
n sickness.

NDICATIONS. Based on a review of this drug by
he National Academy of Sciences-National Research
Council and/or other information, FDA has classified
he indications as follows:
Effective: Management of nausea and vomiting and
lizziness associated with motion sickness.
Possibly Effective: Management of vertigo asso-
iated with diseases affecting the vestibular system.
Final classification of the less than effective indica-
ions requires further investigation.

CONTRAINDICATIONS. Administration of Antivert during pregnancy or to women who may become pregnant is contraindicated in view of the teratogenic effect of the drug in rats.

The administration of meclizine to pregnant rats during the 12th-15th day of gestation has produced cleft palate in the offspring. Limited studies using doses of over 100 mg./kg./day in rabbits and 10 mg./kg./day in pigs and monkeys did not show cleft palate. Congeners of meclizine have caused cleft palate in species other than the rat.

Meclizine HCl is contraindicated in individuals who have shown a previous hypersensitivity to it.

WARNINGS. Since drowsiness may, on occasion, occur with use of this drug, patients should be warned of this possibility and cautioned against driving a car or operating dangerous machinery.

Usage in Children: Clinical studies establishing safety and effectiveness in children have not been done; therefore, usage is not recommended in the pediatric age group.

Usage in Pregnancy: See "Contraindications."

ADVERSE REACTIONS. Drowsiness, dry mouth and, on rare occasions, blurred vision have been reported.

Notes of interest from Here . . . . and There

Dr. C. Howe Eller, St. Louis County health commissioner since 1959, has retired (effective April 1) and will become the first executive director of Health Delivery Services, Inc., a federally-funded, independent agency that will work to improve community health care services in the St. Louis area. As health commissioner, Dr. Eller started a number of new programs, including family planning and maternity clinics and agreements with municipalities for environmental health services. His office also supervised air pollution control. He is on the faculties of Washington University and St. Louis University schools of medicine.

Dr. James E. Crockett, Kansas City, was elected secretary of the American College of Cardiology at the 22nd Annual Scientific Session of the organization in February. A total of 9,500 cardiologists, heart surgeons and guests attended the meeting in San Francisco.

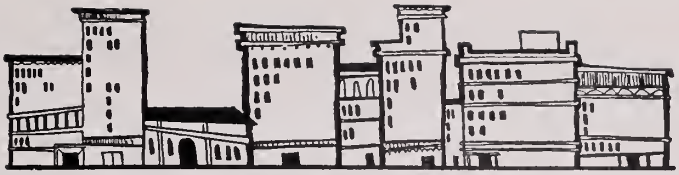
Dr. Fred C. Reynolds, St. Louis, was the subject of an interesting feature story in the *St. Louis Globe-Democrat* on February 24-25. A professor of orthopedic surgery at Washington University's School of Medicine and Barnes Hospital, Dr. Reynolds has served for ten years as the football Cardinals' orthopedist and more recently, also the team's physician. In addition to complimentary comments by various team members and colleagues, the subhead for the story stated that ". . . Dr. Fred C. Reynolds, the Big Red's great orthopedist and team physician, has been one of life's total professionals for more than 40 years."

Dr. Carroll P. Hungate, Kansas City, who recently retired as plant physician for Ford Motor Co. in Kansas City, was the guest speaker at a luncheon meeting of the Rotary Club in Marshall recently. In his address, Dr. Hungate cited the important role an industrial physician has in our society and described his experience as a plant physician.

Dr. Clement E. Brooke, Columbia, has been selected by the American Academy of Pediatrics to serve as a Head Start consultant in Columbia. He is one of more than 600 consultants selected to evaluate the medical aspects of Head Start programs in nearly 2,000 communities throughout the United States, Puerto Rico, Virgin Islands and the trust territories in the Pacific. Under this service, the AAP provides consultants who advise and offer technical assistance to the Head Start programs at the state and local level.

The Cooper County Hospital in Boonville has elected medical staff officers to serve for 1973. They are **William A. Abele,** M.D., chief-of-staff; **Edward T. Humphreys,** M.D., vice chief-of-staff; and **J. F. Jonas,** D.D.S., secretary. Appointees to other positions were **Byron M. Stuart,** M.D., chief of medicine; Edward T. Humphreys, M.D., chief of obstetrics-gynecology; **Willard B. Avery,** M.D., chief of pediatrics; and J. F. Jonas, D.D.S., chief of dental surgery.

From the Medical Schools



ST. LOUIS UNIVERSITY

Five Soviet heart experts visited the St. Louis University Medical Center on February 19-20 as part of a U.S.-U.S.S.R. Health Exchange Agreement and U. S. visit on Management of Ischemic Heart Disease. Hosting the St. Louis visit was *Dr. V. L. Willman,* a member of the four-man U. S. ischemic heart expert team which visited Russia for two weeks last September. He is professor and chairman of the Department of Surgery at the School of Medicine.

While here, the Soviet delegates toured the St. Louis University Hospitals, making special stops at the Cardiac Catheterization Laboratories directed by *Dr. J. F. Gerard Mudd,* who is associate professor of internal medicine at the School of Medicine and President of the St. Louis Heart Association. They also toured many other areas of the Hospitals and Medical Center. In addition, they visited Washington University's Coronary Care unit.

The visiting Russian delegates began their U. S. visit at Bethesda, Md., where their principal hosts during their five days of conferences at the National Heart Institute were *Dr. Theodore Cooper,* NHLI Director, and *Dr. Peter Frommer,* associate director for Cardiology of the NHLI Division of Heart and Vascular Diseases. Dr. Cooper received both the M.D. and Ph.D. degrees at St. Louis University. Dr. Frommer is U. S. Chairman for the Cooperative Project on Management of Ischemic Heart Disease. The U.S.S.R. Project Chairman, *Professor Skhkvatsabaya,* received an award from the American College of Cardiology in San Francisco where all the Soviet delegates and Dr. Willman were present before their trip to St. Louis University.

Soviet and American heart experts are planning a cooperative research attack against the greatest cause of death in both countries—coronary heart disease. Experts of both nationalities, including Dr. Willman of St. Louis, met at the National Heart and Lung Institute on February 4-8 in a project which aims, over a period of years, to evaluate and compare angina and heart attack disability treatment methods that have been developed in each country separately until now.

Seated *(left to right)*: Dr. Igor K. Skhkvatsabaya, Director of Myasnikov Research Institute of Cardiology; Dr. V. L. Willman, professor and chairman of the Department of Surgery, St. Louis University School of Medicine; Dr. Lidiya F. Shvetsova, Chief Specialist of U.S.S.R. Ministry of Health; and Dr. Zavan L. Dolapchyan, Institute of Cardiology of the Ministry of Health of Armenia. Standing *(left to right)*: Dr. Nikolay A. Mzur, Researcher, Myasnikov Research Institute of Cardiology, and Dr. Robert A. Grigoryants, Researcher, Myasnikov Research Institute of Cardiology.

An immediate goal of the Project members who met in the U. S. last month was to establish standard definitions, criteria and methods as a common ground for experts of both nationalities to discuss, plan and eventually conduct cooperative studies of the ischemic heart disease therapies in both countries. It is envisioned that detailed plans of action incorporating these standards and major points of agreement will be ready for implementation by Dec. 31, 1973.

A conference on Medical Education for Comprehensive Patient Care was sponsored by the School of Medicine on February 19-20. *Honorable William Roy,* M.D., member of Congress from Kansas, a well-known advocate of comprehensive group practice, spoke as a physician-congressman on current issues. *Mr. Alphonso Lynch,* president of the St. Louis Regional Comprehensive Health Planning Agency (ARCH) and Executive Director of the Yeatman Community Corp., was the keynote luncheon speaker on February 20. The Conference concluded a year's work by a faculty/student committee on the subject of educating future physicians in the elements of managing the total needs of a patient. *Dr. Max Pepper,* chairman of the Department of Community Medicine, was project director of the conference.

Dr. Vernon L. Nickel, chief of surgical services, Rancho Los Amigos Hospital, and clinical professor of orthopedic surgery, University of Southern California, will deliver the 28th annual Hanau Loeb Lecture sponsored by Phi Delta Epsilon medical fraternity on April 5 at 12-noon. His lecture titled "Orthoneering-Engipedics" is open to the medical public. His address will cover modern technology aiding the disabled. The lecture will be held in Glennon Hall.

Dr. Robert E. Olson, professor and chairman of the Department of Biochemistry, School of Medicine, was scheduled to discuss the value of Vitamin E on John Chancellor's "Nightly News Roundup." A film interview by NBC-TV correspondent Catherine Macken was to be shown in late February or the first part of March.

UNIVERSITY OF MISSOURI-COLUMBIA

An institutional grant of $30,000 has been awarded to the University of Missouri-Columbia by the American Cancer Society. According to the donor organization, its primary purpose is to serve as "seed" money to permit the initiation of new projects on novel ideas, especially by young investigators.

Eight investigators on the Columbia campus will receive some of these funds in pursuing their research. They are looking for new approaches to the cause and treatment of cancer through basic scientific research.

A campus committee comprised of seven professors in medicine, radiology, botany, plant pathology and veterinary microbiology made the selection of projects to be supported in the coming year by the young investigators. *Dr. Charles E. Mengel* is chairman of the committee; other members are *Drs. Gwilym S. Lodwick, John Grunau, Daniel F. Millikan, Richard Dorn, Raymond W. Loan* and *Reginald Pugh.*

Recipients of the grant funds are *Drs. Leonard Brubaker,* assistant professor, Department of Medicine; *Robert Carolla,* chief resident, Department of Medicine; *Thomas J. Prendergast,* director, Division of Community Health Science; *Beryl Ortwerth,* biochemist, Department of Ophthalmology; *John D. David,* assistant professor of biological science; *Hans K. Adldinger,* associate professor of veterinary microbiology; *Nasrollah Hakami,* associate professor of pediatrics; and *Edwin M. Kaiser,* associate professor of chemistry.

A chance to gain additional training in modern techniques has been given to medical technologists throughout Missouri for more than four years via traveling workshops sponsored by the Office of Continuing Education and Extension of the University of Missouri Medical Center. These workshops, under the direction of the Department of Pathology, are designed "To bring what is current and useful into this very rapidly changing area of medical laboratory science," according to Dr. *A. Matthew Gottlieb,* instructor in pathology.

One such workshop, entitled "Current Topics in Microbiology," was presented on February 15 and 16 at St. Mary's Hospital in Jefferson City. It was designed to bring current thinking and antibiotic usage related to this group of microscopic disease-causing, rod-shaped bacteria to medical technologists, Dr. Gottlieb explained. He pointed out that experience has indicated that laboratory workload doubles every ten years and the technology which accompanies this increased workload changes about every seven years.

WASHINGTON UNIVERSITY

Washington University School of Medicine has appointed *Elmer B. Brown, Jr.,* M.D., to the newly-created position of associate dean for continuing medical education.

Dr. Brown, professor of medicine, has served as director of the Division of Hematology for nine years. He will relinquish this position in July, but will continue his teaching, clinical practice and research in this area.

His new activity will be to coordinate continuing training for all medical specialties. Meetings and courses will be designed to help physicians keep abreast of changes and improvements in the profession.

Dr. Brown

Dr. Brown attended the University of Missouri for one year and then Oberlin College, where he received the A.B. degree in 1946. He earned the M.D. degree, cum laude, from Washington University in 1950. Following internship and residency at New York's Presbyterian Hospital, Dr. Brown served two years in the U. S. Navy before returning to Washington University for postgraduate training in hematology.

In 1955, he was appointed to the Department of Medicine faculty as an instructor. In 1957-1959, he was appointed a Public Health Service Special Research Fellow in enzyme biochemistry at the National Heart Institute. Upon his return to St. Louis he was promoted to assistant professor. In 1964, he was named associate professor, and in 1971, professor.

Continuing Education Coming Events

April 5-6	**Clinical Approach to Allergic Disorders** Medical Center Continuing Education, St. Louis University Miller Hall, Firmin Desloge Hospital St. Louis
April 5-6	**25th Annual Midwest Cancer Conference** American Cancer Society, Kansas Division, Inc. Wichita, Kan.
April 11-12	**19th Annual Urology Seminar** Continuing Education, University of Missouri-Columbia and Kansas City Urological Society Alameda Plaza, Kansas City
April 13	**Symposium: Infectious Diseases** Postgraduate Medical Study K.U. School of Medicine, Kansas City, Kan.
April 23-25	**Symposium: Anesthesiology** Postgraduate Medical Study K.U. School of Medicine, Kansas City, Kan.
May 3-4	**Spring Clinical Conference—What's New and Review of Selected Gastro-Intestinal Diseases** Continuing Education, M.U. School of Medicine VA Hospital, Columbia
May 10-11	**Symposium: Inhalation Therapy** Postgraduate Medical Study K.U. School of Medicine, Kansas City, Kan.
May 14-15	**Symposium: New Advances in Electrocardiography** Postgraduate Medical Study K.U. School of Medicine, Kansas City, Kan.

Postgraduate Course in Clinical Allergy

A basic course in serial dilution titration technique and food allergy diagnosis and treatment will be held at the Alameda Plaza Hotel in Kansas City on April 16-19. Sponsor is the Greater Kansas City, Missouri, Chapter of the American Academy of Family Physicians. The program is acceptable for 30 prescribed hours by the AAFP. Registration fee of $165 includes three luncheons and the banquet on Tuesday. Advance registration is requested. For registration forms, write to James W. Willoughby, M.D., Suite 1505, Traders National Bank Bldg., 1125 Grand Ave., Kansas City, Mo. 64106.

In Memoriam

R. Lee Hoffmann, M.D., 631 West Park, Olathe, Kan., a graduate of Kansas University, 1915; member Jackson County Medical Society; age 83; died Dec. 22, 1972.

Edwin L. Pfuetze, M.D., Plaza Parkway Bldg., Kansas City, a graduate of the University of Kansas, 1942; member Jackson County Medical Society; age 59; died Dec. 31, 1972.

PRESCRIBING INFORMATION

Antiminth (pyrantel pamoate) Oral Suspension

Actions. Antiminth (pyrantel pamoate) has demonstrated anthelmintic activity against *Enterobius vermicularis* (pinworm) and *Ascaris lumbricoides* (roundworm). The anthelmintic action is probably due to the neuromuscular blocking property of the drug.

Antiminth is partially absorbed after an oral dose. Plasma levels of unchanged drug are low. Peak levels (0.05-0.13μg/ml.) are reached in 1-3 hours. Quantities greater than 50% of administered drug are excreted in feces as the unchanged form, whereas only 7% or less of the dose is found in urine as the unchanged form of the drug and its metabolites.

Indications. For the treatment of ascariasis (roundworm infection) and enterobiasis (pinworm infection).

Warnings. *Usage in Pregnancy:* Reproduction studies have been performed in animals and there was no evidence of propensity for harm to the fetus. The relevance to the human is not known.

There is no experience in pregnant women who have received this drug.

Precautions. Minor transient elevations of SGOT have occurred in a small percentage of patients. Therefore, this drug should be used with caution in patients with pre-existing liver dysfunction.

Adverse Reactions. The most frequently encountered adverse reactions are related to the gastrointestinal system.

Gastrointestinal and hepatic reactions: anorexia, nausea, vomiting, gastralgia, abdominal cramps, diarrhea and tenesmus, transient elevation of SGOT.

CNS reactions: headache, dizziness, drowsiness, and insomnia. Skin reactions: rashes.

Dosage and Administration. *Children and Adults:* Antiminth Oral Suspension (50 mg. of pyrantel base/ml.) should be administered in a single dose of 11 mg. of pyrantel base per kg. of body weight (or 5 mg./lb.); maximum total dose 1 gram. This corresponds to a simplified dosage regimen of 1 cc. of Antiminth per 10 lb. of body weight. (One teaspoonful = 5 cc.)

Antiminth (pyrantel pamoate) Oral Suspension may be administered without regard to ingestion of food or time of day; and purging is not necessary prior to, during, or after therapy. It may be taken with milk or fruit juices. Because of limited data on repeated doses, no recommendations can be made.

How Supplied. Antiminth is available as a pleasant tasting caramel-flavored suspension which contains the equivalent of 50 mg. pyrantel base per ml., supplied in 60 cc. bottles.

ravase® Ointment brand of Sutilains

PLICATION TECHNIQUE: TRAVASE Ointment is indicated as an adjunct established methods of wound care for biochemical debridement. It ssolves and facilitates the removal of necrotic tissues and purulent udates.

RAVASE enzymes are selective. Virtually inactive on viable tissue.

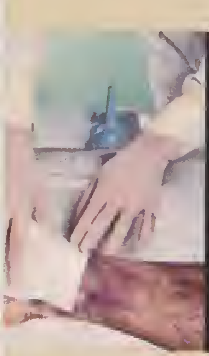
hen this recommended nursing technique is followed without deviation, is procedure can generate visible improvement within 48 hours . . .

r being irrigated) oughly cleanse and ate the wound area using sterile water or sodium ride solution. Be sure to ise the wound of any eptics or heavy-metal acterial agents which interfere with the ne activity.

Thoroughly soak the wound area. Where practical, tubbing or showering is suitable. Or wet soaks with gauze pads may be used. Remember to avoid chemical cleansing agents which may interfere with the therapy.

With a sterile cotton swab or finger cot, apply a very thin layer of TRAVASE Ointment. The ointment spreads easily and only a small amount is needed (a small dab of ointment will cover an area as big as the back of a hand).

Be sure, though, to rub the ointment well into every crack or crevice of the wound and overlap the surrounding skin one-fourth to one-half inch beyond the area to be debrided—to be sure of complete coverage.



y loose, wet dressings, oughly soaked in sodium ride solution or sterile r to the area to be ided only.

Cover the moist dressings with an occlusive wrap (Saran wrap, Telfa Pads, or other plastic wrappings) to keep wound site moist. Do not extend occlusive wrap over ½ inch beyond area to be debrided.

When changing dressing, gently wipe away the dissolved material. Repeat the complete dressing procedure, including application of TRAVASE Ointment, four times daily.

ulcer shown in these photos is simulated on a model in order to demonstrate correct TRAVASE application technique.

______Additional Information on TRAVASE® Ointment (brand of Sutilains)

______In-service training program

______Comment ______________________________

DESCRIPTION: TRAVASE® (brand of sutilains) Ointment is a staril preparation of proteolytic enzymes, elaborated by **Bacillus subtilis**, hydrophobic ointment base consisting of 95% white petrolatum an polyethylene. One gram of ointment contains approximately 82,000 units* of proteolytic activity.

ACTION: TRAVASE Ointment selectively digests necrotic soft tissu proteolytic action. It dissolves and facilitates the removal of necro tissues and purulent exudates that otherwise impair formation of granulation tissue and delay wound healing (4).

At body temperatures these proteolytic enzymes have optimal acti the pH range from 6.0 to 6.8.

INDICATIONS: For wound debridement (1,2)—TRAVASE Ointment indicated as an adjunct to established methods of wound care for biochemical debridement of the following lesions:

Second and third degree burns,
Decubitus ulcers,
Incisional, traumatic, and pyogenic wounds,
Ulcers secondary to peripheral vascular disease.

CONTRAINDICATIONS: Application of TRAVASE (brand of sutilain Ointment is contraindicated in the following conditions:

Wounds communicating with major body cavities,

Wounds containing exposed major nerves or nervous tissua,

Fungating neoplastic ulcers,

Wounds in women of child-bearing potential—because of lack laboratory evidence of effects of TRAVASE upon the develop

Do not permit TRAVASE Ointment to come Into contac the eyes. In treatment of burns or lesions about the head or nack, the ointment inadvertently come into contact with the eyes, the ey be immediately rinsed with copious amounts of water, preferably

PRECAUTIONS: A moist environment is essential to optimal activi enzyme. Enzyme activity may also be impaired by certain agents. several detergents and antiseptics (benzalkonium chloride, hexachlorophene, iodine, and nitrofurazone) may render the subst indifferent to the action of the enzyme (3). Compounds such as th containing metallic ions interfere directly with enzyme activity to slight degree, whereas neomycin, sulfamylon-streptomycin, and p do not affect enzyme activity. In cases where adjunctive topical t has been used and no dissolution of slough occurs after treatman TRAVASE Ointment for 24 to 48 hours, further application, becaus interference by the adjunctive agents, is unlikely to be rewarding.

In cases where there is existent or threatening invasive infection, appropriate systemic antibiotic therapy should be instituted concu

Although there have been no reports of systemic allergic reaction humans, studies have shown that there may be an antibody respo humans to absorbed enzyme material.

ADVERSE REACTIONS: Adverse reactions consist of mild, transia paresthesias, bleeding and transient dermatitis. Pain usually can controlled by administration of mild analgesics. Side effects seve enough to warrant discontinuation of therapy occasionally have o

If bleeding or dermatitis occurs as a result of the application of T (brand of sutilains) Ointment, therapy should be discontinued. No toxicity has been observed as a result of the topical application c TRAVASE Ointment.

Dosage and Administration

STRICT ADHERENCE TO THE FOLLOWING IS REQUIRED FOR E RESULTS OF TREATMENT

1. Thoroughly Cleanse and Irrigate Wound Area with sodiur or water solutions. Wound **MUST** be cleansed of antisept heavy-metal antibacterials which may denature enzyme o substrate characteristics (e.g., Hexachlorophene, Silver Benzalkonium Chloride, Nitrofurazone, etc.).
2. Thoroughly moisten wound area either through tubbing, or wet soaks (e.g., sodium chloride or water solutions).
3. Apply TRAVASE Ointment in a thin layer assuring intima with necrotic tissue and complete wound coverage exten ¼ to ½ inch beyond the area to be debrided.
4. Apply loose wet dressings.
5. Repeat entire procedure 3 to 4 times per day for best ra

How Supplied

3P3002 TRAVASE Ointment is supplied sterile in one-half ounc (14.2 g.) containing 82,000 casein units of sutilains per hydrophobic ointment base.

The ointment must be stored under refrigeration at 2° to 10° C (35° to 50° F).

DIVISION OF TRAVENOL LABORATORIES, INC.
Morton Grove, Illinois 60053

Maybe the patient's self-diagnosis is right. He could have hay fever. But that bright red nasal mucosa, along with the thick discharge and excoriation around the nares, strongly suggests that the main problem is a cold. Hay fever or another form of allergic rhinitis may or may not be an underlying factor.

If a complete history and examination rule out allergic rhinitis, the long-term outlook will be a lot more favorable than his own "diagnosis" would have indicated.

But right now, whether he's got allergic rhinitis or a cold, he's suffering from the same irritating symptoms of drip, congestion and stuffiness. Try DIMETAPP EXTENTABS®. They're formulated to relieve these symptoms without much chance of causing drowsiness or overstimulation. Your patients will appreciate the 24-hour relief they can get from just one tablet every 12 hours.

Cold or

Allergy?

Whether it's a cold or an allergy, Dimetapp Extentabs® effectively relieve stuffiness, drip and congestion.

INDICATIONS: Dimetapp Extentabs are indicated for symptomatic relief of allergic manifestations of upper respiratory illnesses, such as the common cold, seasonal allergies, sinusitis, rhinitis, conjunctivitis and otitis. In these cases it quickly reduces inflammatory edema, nasal congestion and excessive upper respiratory secretions, thereby affording relief from nasal stuffiness and postnasal drip.

CONTRAINDICATIONS: Hypersensitivity to antihistamines of the same chemical class. Dimetapp Extentabs are contraindicated during pregnancy and in children under 12 years of age. Because of its drying and thickening effect on the lower respiratory secretions, Dimetapp is not recommended in the treatment of bronchial asthma. Also, Dimetapp Extentabs are contraindicated in concurrent MAO inhibitor therapy.

WARNINGS: *Use in children:* In infants and children particularly, antihistamines in overdosage may produce convulsions and death.

PRECAUTIONS. Administer with care to patients with cardiac or peripheral vascular diseases or hypertension. Until the patient's response has been determined, he should be cautioned against engaging in operations requiring alertness such as driving an automobile, operating machinery, etc. Patients receiving antihistamines should be warned against possible additive effects with CNS depressants such as alcohol, hypnotics, sedatives, tranquilizers, etc.

ADVERSE REACTIONS: Adverse reactions to Dimetapp Extentabs may include hypersensitivity reactions such as rash, urticaria, leukopenia, agranulocytosis, and thrombocytopenia; drowsiness, lassitude, giddiness, dryness of the mucous membranes, tightness of the chest, thickening of bronchial secretions, urinary frequency and dysuria, palpitation, hypotension/hypertension, headache, faintness, dizziness, tinnitus, incoordination, visual disturbances, mydriasis, CNS-depressant and (less often) stimulant effect, anorexia, nausea, vomiting, diarrhea, constipation, and epigastric distress.

HOW SUPPLIED: Light blue Extentabs in bottles of 100 and 500.

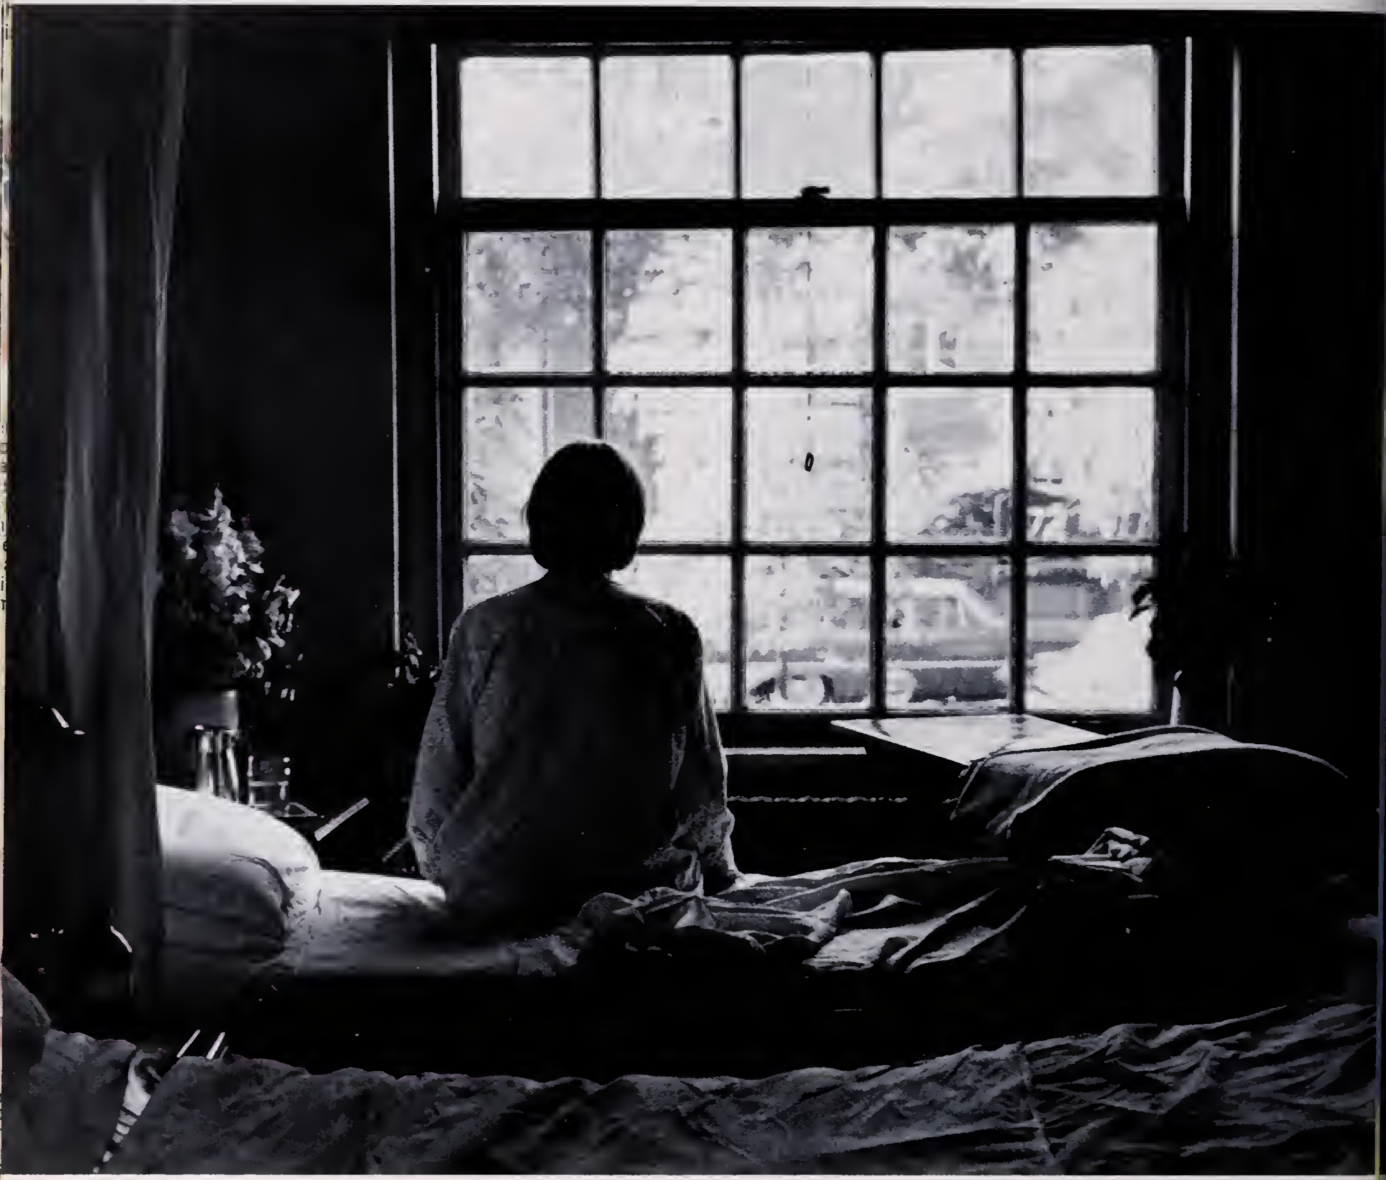
Dimetapp Extentabs®

Dimetane® (brompheniramine maleate), 12 mg.; phenylephrine HCl, 15 mg.; phenylpropanolamine HCl, 15 mg.

A·H·ROBINS

A. H. Robins Company, Richmond, Va. 23220

when pain goes on... and on... and on–



For the patient with a terminal illness, PAIN past, present, and future can dominate his thoughts until it becomes almost an obsession. The more he is aware of the pain he is now experiencing, the more difficult it is to erase his memory of yesterday's pain, and to allay his fearful anticipation of tomorrow's pain.

Surely the last thing this patient needs is an analgesic containing caffeine to stimulate the senses and heighten pain awareness. A far more logical choice is Phenaphen with Codeine. The sensible formula provides ¼ grain of phenobarbital to take the nervous "edge" off, so the rest of the formula can help control the pain more effectively. Don't you agree, Doctor, that psychic distress is an important factor in most of your terminal and long-term convalescent patients?

the analgesic formula that calms instead of caffeinates

Phenaphen® with Codeine

Phenaphen with Codeine No. 2, 3, or 4 contains: Phenobarbital (¼ gr.), 16.2 mg (warning: may be habit forming); Aspirin (2½ gr.), 162.0 mg ; Phenacetin (3 gr.), 194.0 mg ; Codeine phosphate, ¼ gr (No. 2), ½ gr. (No. 3) or 1 gr (No. 4) (warning: may be habit forming)

Indications: Provides relief in severer grades of pain, on low codeine dosage, with minimal possibility of side effects. Its use frequently makes unnecessary the use of addicting narcotics. **Contraindications:** Hypersensitivity to any of the components. **Precautions:** As with all phenacetin-containing products, excessive or prolonged use should be avoided. **Side effects:** Side effects are uncommon, although nausea, constipation and drowsiness may occur. **Dosage:** Phenaphen No. 2 and No. 3—1 or 2 capsules every 3 to 4 hours as needed: Phenaphen No. 4—1 capsule every 3 to 4 hours as needed. For further details see product literature.

Ⓒ III Phenaphen with Codeine is now classified in Schedule III, Controlled Substances Act of 1970. Available on written or oral prescription and may be refilled 5 times within 6 months, unless restricted by state law.

Gender Identity Problems in the Sexually Ambiguous Child

THE FAIRLY RECENT CLARIFICATION of many of the biological factors involved in aberrations of sexual development has stimulated an expansion of the interest of psychiatrists and psychologists in sex and gender deviations. This has given rise to the establishment of gender identity clinics in several centers where interdisciplinary teams of psychiatrists, urologists, pediatricians and obstetricians can evaluate and assist patients with disturbances in gender identity.

According to Stoller,[1] normal development of sex and gender is dependent upon three interrelated factors: sexual identity, gender identity and gender role.

Sexual identity is biologically or genetically determined and is assigned at birth based on five factors: (1) the configuration of the external genitalia, (2) the internal genitals, (3) chromosome configuration, (4) hormonal composition and (5) secondary sexual characteristics or pubertal hormones. In normal development, these form a cohesive pattern so that the physician has no doubt about the sex of the newborn child.

Gender is a term that has psychological or cultural rather than biological connotations. It is related to whether a person thinks of himself as belonging to one sex or another. It is felt that by 40 months of age, a child says to himself, "I am a boy" or "I am a girl" and, thus, has a gender identity. Gender identity is thought to be a learned behavior produced by three factors: (1) the parents' attitudes toward the infant's sex, (2) the infant's growing awareness of its external genitalia and (3) possibly an unknown biological force. The most important factor in establishing gender identity is felt to be the parental attitude toward the biological sex of assignment.

Gender role refers to the overt behavior a person displays in society, a role which is either masculine or feminine. This is learned behavior and is usually not at variance with gender identity and sex.

PURPOSE

In infants with ambiguous external genitalia, the biological sex cannot always be determined by the appearance of the external genitalia and mistakes of sex assignment can have devastating psychologic effects in later years when the proper sex is discovered. We became interested in studying gender identity in children with ambiguous external genitalia and have tried to determine whether or not these children might have gender identity problems. It was hypothesized that if the child's parents had some doubt as to the child's sex, these feelings would be conveyed to the child, and that with this doubt and the ex-

The authors conducted a study of gender identity in children with ambiguous external genitalia to determine whether or not these children have gender identity problems. They discuss results of interviews with both children and parents, the areas of questioning and observation and their conclusion. Formerly an Instructor in Psychiatry at the Mid-Missouri Health Center, Dr. Buchanan is now in private practice in Kansas City. Dr. Thompson is Chief of Urology at the University of Missouri School of Medicine. Dr. Kirk, who completed his residency in Urology at the School of Medicine, is serving at Scott Air Force Base, Ill.

istence of ambiguous external genitals, the child might be expected to exhibit gender identity problems.

Sample

Children born with ambiguous external genitalia who had been studied by the Section of Urology of the University of Missouri School of Medicine were the substrate of the investigation. A letter explaining the purpose of our study was mailed to the parents of these children along with an application form, if they were interested in being included in the study. The sample size was limited by the number of replies received from the parents. Many families could not be located or failed to respond. Our final group comprised only nine patients; four cases of female pseudohermaphroditism (adrenogenital syndrome), four cases of male pseudohermaphroditism and one case of true hermaphroditism. Three other children, two true hermaphrodites and one female pseudohermaphrodite (A-G Syndrome) not formally studied due to parental resistance, who have been observed frequently during followup visits through the years will be discussed since their gender roles appear clearly established.

Four children with the adrenogenital syndrome had been correctly assigned as to sex at birth. All were under hormonal control. All the male pseudohermaphrodites had been raised as boys since infancy and all had undergone surgery to align their genital abnormalities to their sex of rearing. The true hermaphrodite studied was thought to be a female until he was seven months old, at which time his parents were told he was genetically a boy. They changed his name and have raised him as a boy since that time. One child not formally included in the study was a female pseudohermaphrodite (A-G Syndrome) raised as a boy until an appendectomy revealed normal female internal genitalia. These were ablated and his urethra was reconstructed since his gender role was so obviously masculine. Of the other true hermaphrodites not formally evaluated, one was raised as a boy. He had a hypospadias repair which strictured and at reconstruction, the true situation became apparent. He has continued to function well in the male role. The other child was raised as a female despite parental doubt as to true sex and has functioned well in this role after ablation of the male gonad.

An interview with each child and mother in the study was conducted using a standard data schedule of topics adapted from Ehrhardt *et al.*[2] An attempt was made to keep the interviews flexible and to find out as much as possible about the family situation and the effect the patient's condition has had upon it. The primary areas of questioning in interviews were toy, playmate and clothing preference, aggressivity, role play and satisfaction with sex role.

In addition to the interview, each patient over four years of age was given the Missouri Children's Picture Series (MCPS).[3] Each parent was given the Missouri Children's Behavior Check List to complete.

Most of the interviews were conducted in the patient's homes.

Findings

From the interview data on toy, playmate and clothing preference, there were no answers given that would indicate a serious gender identity problem. In one 9-year-old male pseudohermaphrodite, it was felt that his toy and playmate preferences were not as strongly masculine as those for most 9-year-old boys. The MCPS profile for this boy was one standard deviation below the normal for 9-year-old boys. This would indicate some feminization but of minimal degree.

The data on aggressivity showed, in general, more evidence of fighting behavior for those children raised as boys than for those raised as girls. There was one exception to this. One male pseudohermaphrodite failed to show fighting behavior probably as a result of immobilization by a spinal condition rather than a lack of aggressivity. The MCPS profile would indicate that this boy is aggressive, as evidenced by an elevated aggression score, but that he must express this aggression in ways other than fighting.

Role play in all cases was consistent with the sex of rearing and the children appeared content with their gender role.

The other areas of questioning, which were physical energy expenditure, the tomboy-sissy dimension and sexual curiosity, were of less value in evaluating gender identity but were consistent with the findings already discussed.

Except for those cases already mentioned, the MCPS scores on the masculinity-femininity scale were unremarkable. In general, the MCPS profiles were not grossly abnormal and did not show any evidence of severe emotional disturbances. The major exceptions to this were the previously mentioned male pseudohermaphrodite whose masculinity-femininity score was low and a 13-year-old boy with adrenogenital syndrome whose profile indicated possible minimal cerebral dysfunction.

Discussion

The results of our interviews with children born with sexual ambiguity and with their mothers indicate that these children do not have gender identity problems. This finding supports the concepts of other authors[4–6] that the sex of rearing is the most important determinant of gender identity. If the parents have no doubt about the sex of their child and if the rearing is thus unequivocal, the child should feel no ambivalence about his true sex and should have no problem forming a proper gender identity despite a growing awareness that the external genitalia may be grossly deformed. Two of the children who were not formally studied but who were observed for a number of years were well aware of their genital deformities. The parents of the female with adrenogenital syndrome believed the child was a male as did the child who was a little league shortstop at the time the appendectomy revealed the true sex. With hormone supplementation, he has continued to do well in his male role. The situation in the true hermaphrodite raised as a male is entirely similar. The parents of the other true hermaphrodite were never clearly told and were not sure of the actual sex of the child, but they steadfastly raised her as a girl and she has given no evidence that she is not happy in this role.

It was quite clear from our interviews that the parents in the present study had no doubt about the sex of their child once the physician told them what it was. The rearing of these children in regard to their sex had been consistent and unequivocal. Even the parents who were first told their child was a girl readily accepted the sex change at seven months. They changed the baby's name and did not doubt the decision. They did not tell the child about the early confusion about his sex and raised him as a boy from seven months of age. Thus, the older children in our study exhibited no signs of gender identity confusion and those who were three years of age or younger should not be expected to have gender identity problems in the future.

Summary

Stoller has stated that gender identity initially depends upon sex assignment and that it becomes relatively fixed by around age of two-and-a-half or three. He believes that gender identity is independent of all variables except the parents' acceptance of the assigned sex. This concept would seem to be substantiated by the present study, in that all the parents interviewed had accepted the sex assigned to their child by the doctors. In some cases, this was in spite of gross genital anomalies and extreme genital ambiguity. The parents have consistently reared their children in the assigned sex and, consequently, the children do not seem to have problems with gender identity.

Traumatic Arteriovenous Fistulae

Case Report

This case report illustrates the value of the Doppler ultrasonic flowmeter in clinical evaluation and intraoperative monitoring of arteriovenous fistulae, particularly of multiple origin. The authors are from the Department of Surgery, University of Missouri School of Medicine.

The accurate preoperative evaluation of arteriovenous fistulae, particularly of multiple origin, is difficult. Particularly, is it easy to overlook small arteriovenous connections during surgery. The purpose of this report is to emphasize the considerable value of the Doppler ultrasonic flowmeter in the preoperative delineation of the problem and to call attention to the assistance it provides the surgeon in seeking out and removing arteriovenous fistulae during the course of the operative procedure. The Doppler ultrasonic flowmeter provides an excellent adjunct to the usual means of delineating arteriovenous malformations prior to surgical correction by use of arteriography techniques. A number of the limitations of arteriography, however, do not apply to the Doppler ultrasonic flowmeter. For example, the latter is an inexpensive, rapid and easily available technique which is noninvasive and provides an excellent means of following the progress of an arteriovenous fistula, both preoperatively and intraoperatively.

We have used the Doppler ultrasonic flowmeter in conjunction with arteriography as a means of better defining the arteriovenous fistula and its possible area of infiltrative hemangiomatous tissue in the patient with congenital hemangioma.[1] We have been able to determine size changes in fistulae created for hemodialysis with the Doppler and have applied the techniques used to determine the relative flow in the traumatic fistula.[2] The ultrasonic flowmeter provides the operator with an audible hemodynamic portrayal of the involved vasculature. It is atraumatic and may be used time and time again without patient discomfort and without the associated morbidity of angiography.

The opportunities to observe arteriovenous fistula are frequent. Traumatic arteriovenous fistula may be caused by penetrating wounds due to stabbing, gunshot or flying objects, such as glass in automobile crashes. They also may be caused by inclusive ligation of arteries and veins to control bleeding. Like all arteriovenous fistulae, they represent an abnormal communication between an artery and a vein and they may occur in an interfascial plane. Because arterial pressure is higher than venous pressure, the arteriovenous fistula will act as a short circuit, in relation to the heart, by means of the diversion of arterial blood into venous channels. When the diversion of arterial inflow is great, there will be compromise of the distal vascular tree.

Hemodynamic alterations caused by fistulae depend, of course, on the magnitude of the fistula; a small fistula may have little to no noticeable effect while a larger fistula will eventually cause an increase in total blood volume, increased cardiac output, increased heart rate and increased heart work. The final result may be left ventricular hypertrophy or congestive heart failure or both. It is necessary to control and surgically correct fistula of significant size before irreversible damage occurs to the heart and the extremity, if the latter is involved.

The Doppler ultrasonic flowmeter is an electronic device that makes use of a modification of a principle first described by Djohann Christian Doppler, an Austrian mathematician and physicist of the 19th century. The principle has to do with changes in the pitch of sound as the distance between the source and listener is rapidly varied. The Doppler instrument consists of an oscillator, a probe (transducer) which contains two piezoelectric crystals with identical natural resonating frequencies; one crystal acts as an output and when contact is made with tissue (using a lubricating gel as an ultrasound conductor), the signal from the output crystal is reflected or backscattered from intravascular particulate matter in motion at a slightly different frequency than the original output frequency. The frequency shift, which is directly proportional to the velocity of the intravascular particulate matter in motion, is detected by the second crystal. The frequency shift (f_d), expressed in cycles per second (cps), is amplified and may be presented as an audio or video (analog) signal.

Case Report

This was the first admission to the Medical Center of this 21-year-old coed who presented with a history of trauma to her right foot about ten years previously when she had stepped on a nail. No abnormalities were noted at that time and she had an uneventful recovery from the experience. Approximately three to four years later, she began to notice numbness and tingling in the toes of her right foot on prolonged standing. At that time, the diagnosis of an arteriovenous malformation in the right foot was made. In the fall of 1971, there was a noticeable thrill in the foot and arteriography demonstrated the primary lesion. She was operated on at another hospital for the arteriovenous malformation of the foot, but her symptomology did not significantly subside.

Six months after the first operation, the young lady was admitted to the University of Missouri Medical Center. A Doppler ultrasonic examination of the right foot was made to delineate and identify the arteriovenous malformations present in the foot. Fig. 1 is a medial view of the foot, and this gives an impression of the depth of the arteriovenous malformations. Fig. 2 shows the areas of arteriovenous malformations noted on the dorsal surface of the foot. Fig. 3 delineates the main area of fistula activity as viewed from the sole of the foot. Thus, the Doppler findings confirmed that multi-channeled fistulae were present in the foot.

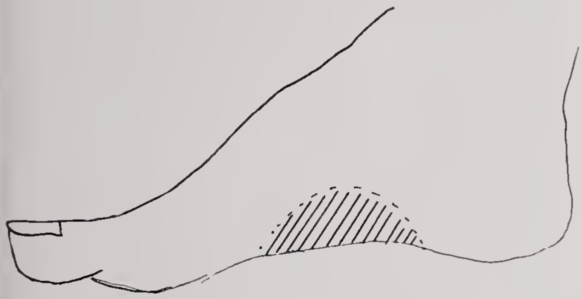

Fig. 1 Areas of greatest concentration of arteriovenous activity in right foot (medial view).

On Aug. 3, 1972, the patient was taken to the operating room. General anesthesia of penthrane and nitrous oxide given by mask with an oral airway was used. An incision was made in a longitudinal manner over the skin of the sole of the foot and extended through the subcutaneous tissue and the palmar aponeurosis. The main body of the fistula was identified by gradually dissecting through the muscle layers of the base of the foot and exposing the lateral plantar arch. The lateral plantar artery was identified. The flexor digitorum longus and the adductor hallicus were retracted medially. Finally, beneath the flexor digitorum longus and the flexor hallicus longus, a large marble-size aneurysmal structure with a multiplicity of feeding vessels, appearing to be arterial in nature, was located. These "feeders" were divided and ligated as were several branches of the lateral plantar artery which appeared to have direct venous connections when examined with the sterile Doppler probe. When all of the branches and the aneurysmal sac had been removed, no further abnormal arteriovenous activity was noted in the area.

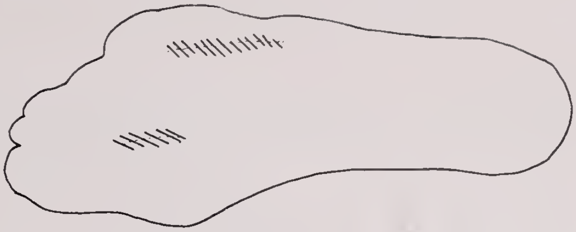

Fig. 2 Areas of arteriovenous malformation activity in top of foot.

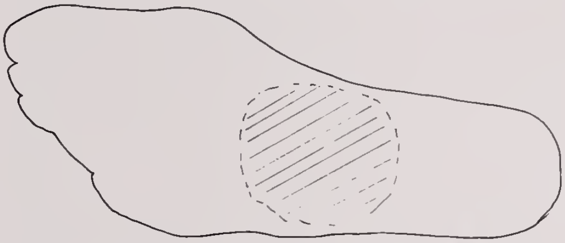

Fig. 3 Primary arteriovenous malformation activity in right as seen from the bottom of the foot.

Nevertheless, on the dorsum of the foot, as seen in Fig. 2, two areas of arteriovenous activity were detected by the ultrasonic flowmeter. Two incisions were made in a longitudional fashion to explore these areas. The first was made medially over the base of the big toe and the second was made over the base of the small toe. Both areas were explored, and a multiplicity of small arteriovenous abnormalities were located and ligated as guided by the Doppler ultrasonic flowmeter.

Postoperative examination with the ultrasonic flowmeter demonstrated that the superficial and deep veins in the lower extremity no longer had pulsatile flow nor were the superficial veins distended. Digital flow was noted in the vascular pads of all of the patient's toes which were pink and had excellent capillary fill. Prior to surgery, the toes on the patient's right foot were cold and exhibited little to

Radiographic Features of Renal Pelvic Carcinoma

DURING AN EIGHT-YEAR PERIOD ending in 1972, 15 patients with carcinoma of the renal pelvis were seen at the University of Missouri Medical Center. Renal angiography was performed in seven instances. We would like to emphasize the application of angiography in the diagnosis of this entity.

The general patient population was in keeping with the experience noted in other series, the disease being most prevalent in the elderly men. There were ten men and five women with an age range of 50 to 83 years and a mean age of 69.

Hematuria was the most common presenting complaint, occurring in 13 patients. One third of the patients had flank pain and three of 15 had a palpable mass. Three individuals had an antecedent, synchronous or subsequent epithelial tumor which involved the bladder or the contralateral renal pelvis or ureter. The renal pelvic tumors in these patients were all of a relatively low grade and stage. However, other urothelial tumors in the same patients were not necessarily of the same low grade and stage. It is of interest that none of the three patients with epidermoid carcinoma had a history of stones or long standing infection in the involved kidney.

Although the diagnosis of renal pelvic carcinoma usually can be established from urographic studies, the authors emphasize the application of angiography in circumstances in which there is diagnostic uncertainty. Their study shows that angiography has the capacity to enhance the precision of preoperative assessment and aid in management of the patient. The authors are from the University of Missouri Medical Center where Dr. Ross is Professor of Surgery (Urology) and Chief Surgeon of the Kidney Transplant Team; Dr. Thompson is Professor of Surgery and Chief of the Urology Section; and Dr. Mullens is Assistant Professor in the Department of Radiology. Formerly a resident at the Medical Center, Dr. Houser is now serving in the U. S. Navy in Puerto Rico.

Five patients had regional or distant metastases when first seen and their mean survival of eight months was substantially less than the 23-month survival in those who initially presented with disease which was presumably localized, but who subsequently died.

DIAGNOSIS

Although urine cytologies were suggestive or conclusive for malignancy in five of eight instances, the presumptive diagnosis was based upon various radiographic procedures (Fig. 1).

RADIOGRAPHIC STUDIES
(15 Patients)

Study	*Number*	*% Abnormal*
Excretory urography	15	93
Retrograde pyelography	14	100
Renal angiography	7	100
Renal scan	5	80

Fig. 1

Excretory urography was abnormal in 14 instances and probably abnormal in the 15th. The characteristic filling defects of pelvic tumor noted in two patients were less common than features such as pyelocalyceal distortion, dilatation or absence of excretion of contrast media found in the more extensive lesions (Fig. 2).

Retrograde pyelograms, performed in 14 patients, were clearly abnormal, although the interpretation of these studies did not particularly augment the findings noted on excretory urography with the exception of those instances where there was no excretion on the excretory study. Thirteen urographic evaluations demonstrated pyelocalyceal distortion with filling defects, compression, calyceal obliteration and stretching, with or without proximal ureteral compression or deviation. In two instances, there was

PYELOGRAPHIC FINDINGS
EXCRETORY UROGRAPHY
(15 Studies)

Finding	*Number*
Non-function	7
Pyelocalyceal distortion (compression, filling defect, etc.)	10
Ureteropelvic obstruction	1

Fig. 2

complete obstruction to the passage of contrast media at the ureteropelvic junction. In general, the definition of the abnormality was more precise on retrograde study and, frequently, was strikingly revealed as noted in the retrograde study in a 72-year-old woman with a large pelvic defect (Fig. 3).

In two patients, the repetition of urography at intervals of two or three months eventually provided the correct diagnosis when the source of urinary tract bleeding was not clarified at the time of initial evaluation.

Angiography was performed in seven patients, the most pressing indication for the procedure being some residual diagnostic uncertainty following other radiographic studies, i.e., the presence or absence of a mass in the kidney or the differential diagnosis between renal pelvic carcinoma, renal parenchymal carcinoma or an inflammatory process.

The angiographic features of invasive renal pelvic carcinoma were fairly consistent in this group of patients (Fig. 4) since all the renal masses were clearly identified as being avascular. The avascular area was not always precisely outlined. Frequently, there was a mottled, patchy appearance to the nephrographic phase, but this was totally at variance with the avascularity observed in benign cystic disease as noted in this 62-year-old woman with a left upper pole mass (Fig. 5). Equally important in the differential diagnosis was the lack of tumor staining in the mass which tended to eliminate renal carcinoma as a diagnostic possibility. Another relatively common finding was vascular encasement with straightening of vessels, vascular pruning and failure of arborization, suggesting an infiltrating process with encirclement of intrarenal vessels.

ANGIOGRAPHIC FEATURES
(7 Studies)

Finding	*Number*
Avascular mass	6
Renal infarction (mid and upper pole)	1
Extraparenchymal vessels	1
Vascular encasement	3
No classical tumor stain	7

Fig. 4

Hypertrophy of the pelvic artery has been described as a characteristic of a large noninvasive renal pelvic tumor. Although all the patients in this series in whom angiograms were performed had invasive tumor, enlargement of the pelvic artery was noted in only one instance when it occurred in conjunction with extraparenchymal vessels streaking from the lower pole of the kidney in a patient with an epidermoid carcinoma.

In general, angiography was felt to be useful enough in patient management to justify its continued inclusion in the evaluation of the pa-

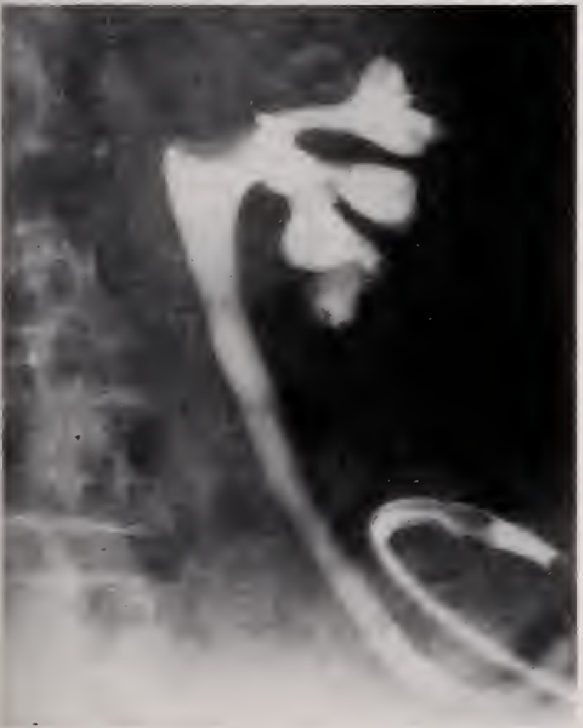

Fig. 3 Retrograde pyelogram demonstrating large filling defect in renal pelvis.

Fig. 6

tient with possible renal pelvic carcinoma in whom the diagnosis has not been clarified by excretory or retrograde urography. With the increased likelihood of renal pelvic carcinoma suggested by the angiographic findings, plans for the most suitable incision can be made in a more appropriate manner.

Although nephroureterectomy is rightfully advocated in the surgical management of invasive renal pelvic carcinoma, simple nephrectomy or even local excision may be indicated in accordance with the clinical staging as has occurred in this series. The decision to perform simple nephrectomy in our patients was based on the findings of local extension at the time of operation, whereas simple tumor excision appeared warranted when the lesions appeared to be superficial and nephrectomy unwarranted for other reasons. Although survival appeared to be improved in the group treated with nephroureterectomy, definite bias in case selection necessarily influenced the results (Fig. 6).

In general, epidermoid and invasive transitional cell carcinoma had an unfortunate outcome. With one exception, all of the patients with invasive transitional cell carcinoma have died, the mean survival being 15 months. Six of the 15 patients or 40% of the series are still living. All but one had noninvasive carcinoma.

In summary, the diagnosis of renal pelvic carcinoma usually can be established or strongly suspected from ordinary urographic studies. In circumstances in which there is diagnostic uncertainty, angiography has the capacity to enhance the precision of preoperative assessment and aid in management of the patient.

Traumatic Arteriovenous Fistulae

(Continued from page 231)

no capillary fill. Digital flow prior to surgery could not be detected with the ultrasonic flowmeter or mercury strain gauge plethysmography.

Discussion

We have presented a case of arteriovenous fistula of the foot which was brought about by a penetrating wound. The evolution of this arteriovenous fistula led to decreased digital flow. Distended superficial veins demonstrated venous valvular incompetence when examined with the ultrasonic flowmeter. Areas of abnormal arteriovenous activity were noted well outside the area of the initial penetrating injury.

The Doppler ultrasonic flowmeter has been used as a diagnostic adjunct at the University of Missouri Medical Center since 1968. It plays a major role in the intraoperative evaluation of the arterial reconstruction and other types of vascular procedures.[3–7] The use of the flowmeter, intraoperatively with gas sterilized probes, allows the surgeon to make a better denouement of the hymodynamic alterations caused by abnormalities in the vasculature.

Summary

The Doppler ultrasonic flowmeter is used to delineate the extent of arteriovenous abnormalities in the foot of a young lady who had suffered a penetrating injury of the sole of the foot as a child. Intraoperative use of the flowmeter with a sterile probe enables the surgeon to locate the abnormal vascular connections and methodically ligate and obliterate them. It allows the discernment of the other areas of arteriovenous abnormalities that escape detection by angiography. We are convinced that the Doppler ultrasonic flowmeter is a valuable diagnostic and intraoperative adjunct to the surgeon's armamentarium.

A DOUBLE-DUTY DIURETIC

Trademark

DYAZIDE®

Each capsule contains 50 mg. of Dyrenium® (brand of triamterene) and 25 mg. of hydrochlorothiazide.

GETS THE WATER OUT IN EDEMA

BRINGS DOWN BLOOD PRESSURE IN HYPERTENSION*

SPARES POTASSIUM IN BOTH

Before prescribing, see complete prescribing information in SK&F literature or *PDR*.

*Indications: Edema associated with congestive heart failure, cirrhosis of the liver, the nephrotic syndrome; steroid-induced and idiopathic edema; edema resistant to other diuretic therapy. Also, mild to moderate hypertension.

Contraindications: Pre-existing elevated serum potassium. Hypersensitivity to either component. Continued use in progressive renal or hepatic dysfunction or developing hyperkalemia.

Warnings: **Do not use dietary potassium supplements or potassium salts unless hypokalemia develops or dietary potassium intake is markedly impaired.** Enteric-coated potassium salts may cause small bowel stenosis with or without ulceration. Hyperkalemia (> 5.4 mEq/L) has been reported in 4% of patients under 60 years, in 12% of patients over 60 years, and in less than 8% of patients overall. Rarely, cases have been associated with cardiac irregularities. Accordingly, **check serum potassium during therapy, particularly in patients with suspected or confirmed renal insufficiency (e.g., elderly or diabetics). If hyperkalemia develops, substitute a thiazide alone. If spironolactone is used concomitantly with 'Dyazide', check serum potassium frequently**—both can cause potassium retention and sometimes hyperkalemia. Two deaths have been reported in patients on such combined therapy (in one, recommended dosage was exceeded; in the other, serum electrolytes were not properly monitored). Observe patients on 'Dyazide' regularly for possible blood dyscrasias, liver damage or other idiosyncratic reactions. Blood dyscrasias have been reported in patients receiving Dyrenium (triamterene, SK&F). Rarely, leukopenia, thrombocytopenia, agranulocytosis, and aplastic anemia have been reported with the thiazides. Watch for signs of impending coma in acutely ill cirrhotics. Thiazides are reported to cross the placental barrier and appear in breast milk. This may result in fetal or neonatal hyperbilirubinemia, thrombocytopenia, altered carbohydrate metabolism and possibly other adverse reactions that have occurred in the adult. When used during pregnancy or in women who might bear children, weigh potential benefits against possible hazards to fetus.

Precautions: Do periodic serum electrolyte and BUN determinations. Do periodic hematologic studies in cirrhotics with splenomegaly. Antihypertensive effects may be enhanced in postsympathectomy patients. The following may occur: hyperuricemia and gout, reversible nitrogen retention, decreasing alkali reserve with possible metabolic acidosis, hyperglycemia and glycosuria (diabetic insulin requirements may be altered), digitalis intoxication (in hypokalemia). Use cautiously in surgical patients. Concomitant use with antihypertensive agents may result in an additive hypotensive effect.

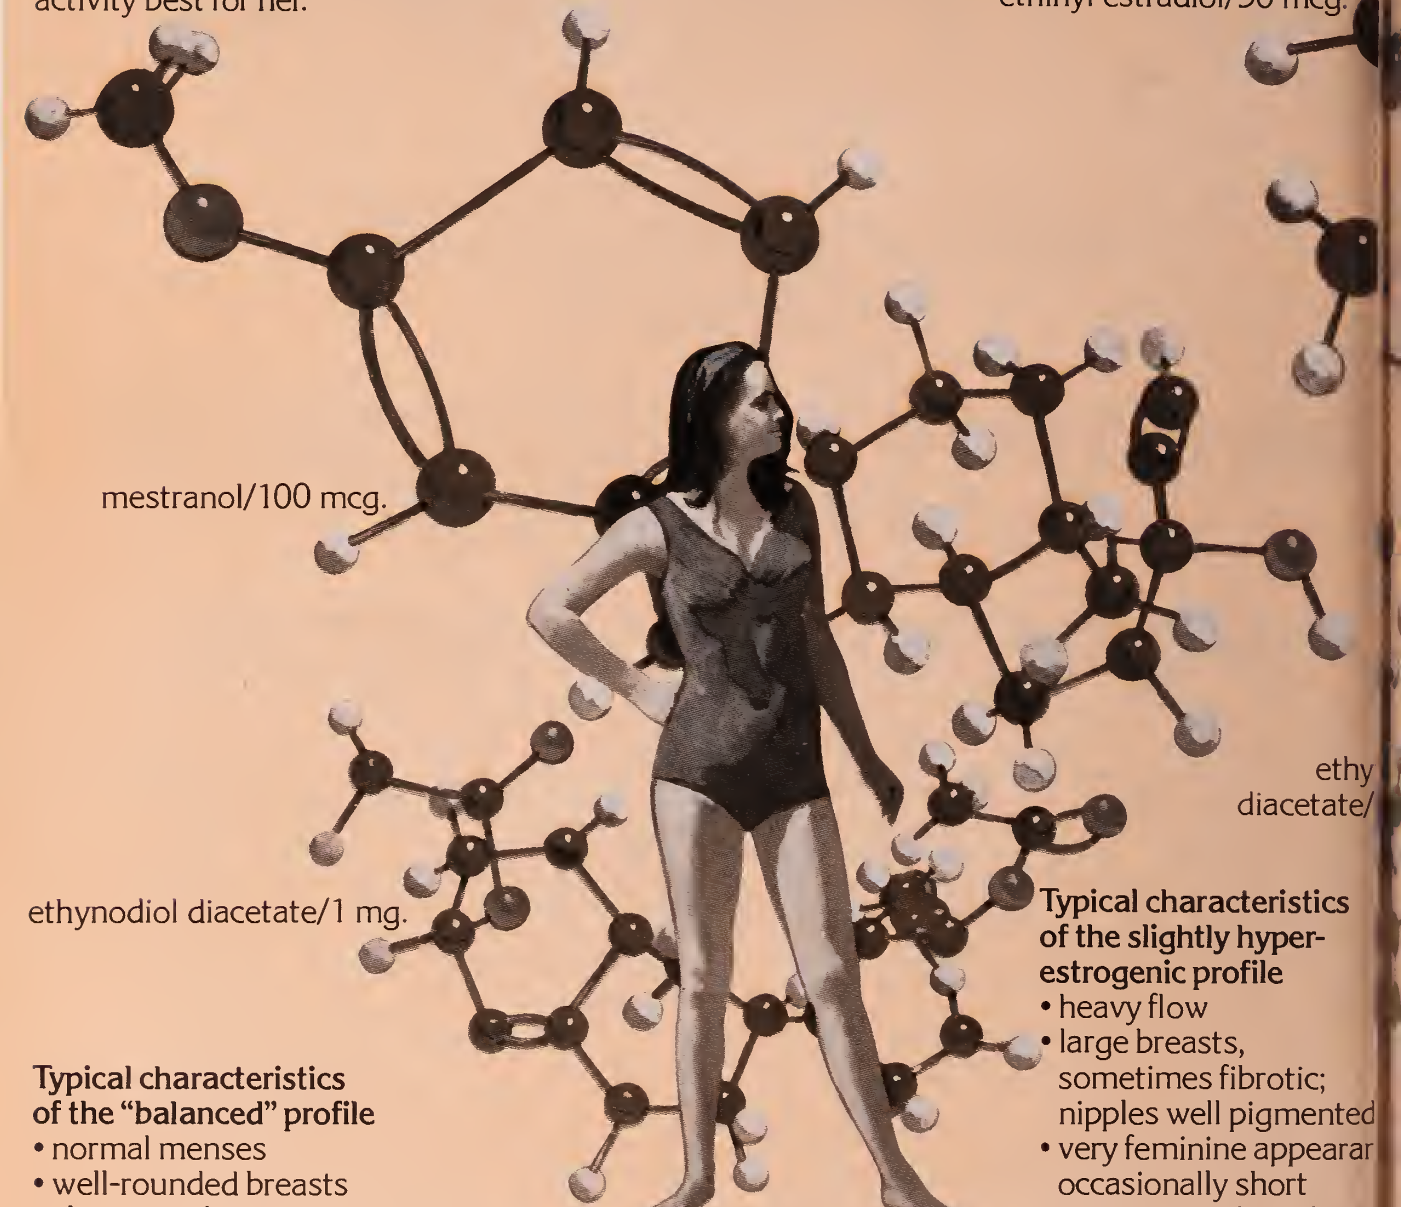
Adverse Reactions: Muscle cramps, weakness, dizziness, headache, dry mouth; anaphylaxis; rash, urticaria, photosensitivity, purpura, other dermatological conditions; nausea and vomiting (may indicate electrolyte imbalance), diarrhea, constipation, other gastrointestinal disturbances. Rarely, necrotizing vasculitis, paresthesias, icterus, pancreatitis, and xanthopsia have occurred with thiazides alone.

Supplied: Bottles of 100 capsules.

SK&F CO.
Carolina, P.R. 00630
a subsidiary of Smith Kline & French Laboratories

What's in it for her?

All steroid molecules are not the same... in their activity. In prescribing birth-control pills, estrogen/progestogen activity is more important than milligrams. The woman's hormone profile often indicates the activity best for her.



ethinyl estradiol/50 mcg.
mestranol/100 mcg.
ethynodiol diacetate/1 mg.
ethy
diacetate/

Typical characteristics of the "balanced" profile
- normal menses
- well-rounded breasts
- clear complexion
- normal figure with normal secondary sex characteristics
- normal cytohormonal pattern

This "center spectrum" pill has had excellent user acceptance for over seven years.

Ovulen®

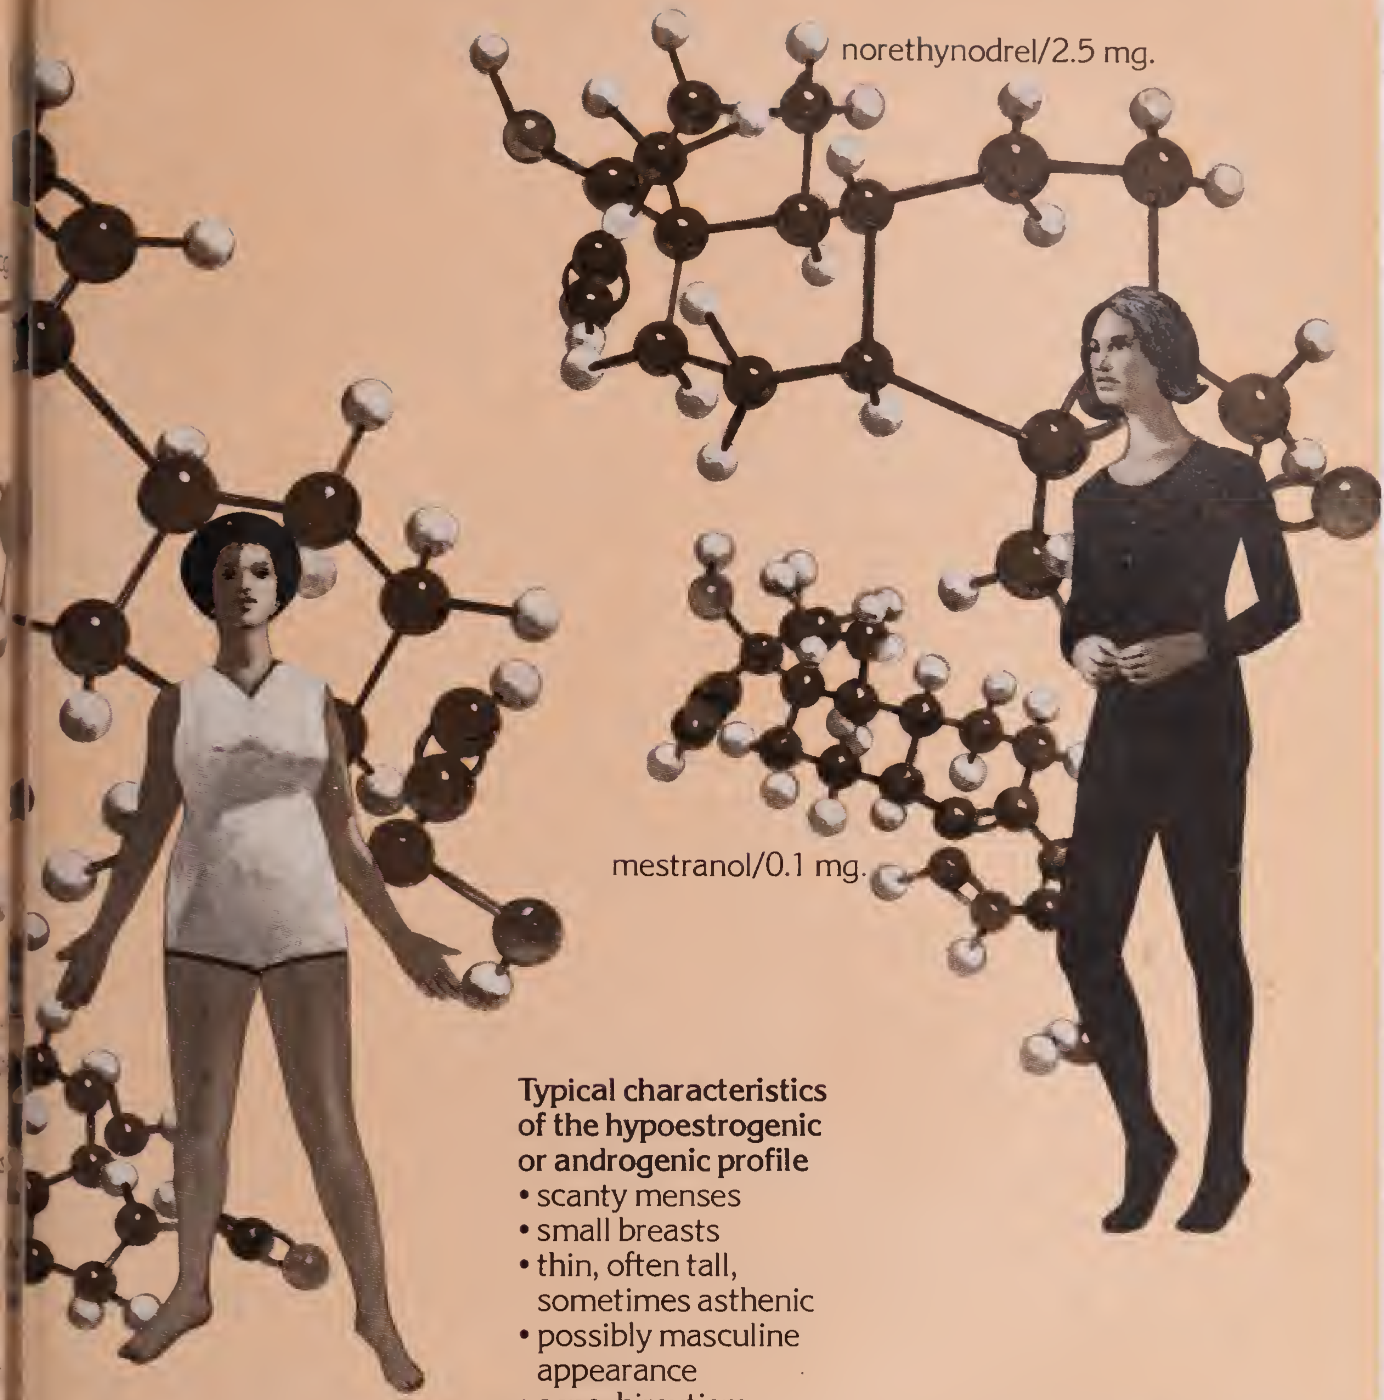
Available in 20-, 21- and 28-pill schedules
Each white tablet contains: ethynodiol diacetate 1 mg./mestranol 0.1 mg.
Each pink tablet in Ovulen-28® is a placebo containing no active ingredients.

for the majority of women... when centrally balanced activity is preferred

Typical characteristics of the slightly hyper-estrogenic profile
- heavy flow
- large breasts, sometimes fibrotic; nipples well pigmented
- very feminine appearar occasionally short
- premenstrual syndrom fluid retention
- tendency to uterine fibroids
- high pyknotic index

This formulation, which less estrogenic activity a a moderate progestogen dominance, may be a go beginning.

For brief summary of prescribing information please see next page.



norethynodrel/2.5 mg.
mestranol/0.1 mg.

Demulen®

vailable in 21- and 28-pill schedules
ach white tablet contains: ethynodiol
iacetate 1 mg./ethinyl estradiol 50 mcg
ach pink tablet in Demulen-28® is a
lacebo containing no active ingredients.

vell suited to most women vhen low estrogenic activity ınd moderate progestogen lominance are preferred

Typical characteristics of the hypoestrogenic or androgenic profile

- scanty menses
- small breasts
- thin, often tall, sometimes asthenic
- possibly masculine appearance
- acne, hirsutism
- low sexual motivation
- thin vaginal lining, tendency to vaginitis and dyspareunia

This pill has a relatively weak and unique* progestogen with inherent estrogenicity. Clinically, just as in animal studies, it appears not to possess antiestrogenic and androgenic activity.

Enovid-E

Available in 20- and 21-pill schedules
Each tablet contains: norethynodrel
2.5 mg./mestranol 0.1 mg.

a clear choice for women when estrogen dominance and no androgenic activity are preferred

*Of all the progestogens, norethynodrel most resembles the molecular structure c the estrogens. It has the weakest progestational activity of any progestogen in a combination pill.

Ovulen®

Each white tablet contains:
ethynodiol diacetate 1 mg./mestranol 0.1 mg.

Demulen®

Each white tablet contains:
ethynodiol diacetate 1 mg./ethinyl estradiol 50 mcg.

Each pink tablet in Ovulen-28® and Demulen-28® is a placebo, containing no active ingredients.

Actions—Ovulen and Demulen act to prevent ovulation by inhibiting the output of gonadotropins from the pituitary gland. Ovulen and Demulen depress the output of both the follicle-stimulating hormone (FSH) and the luteinizing hormone (LH).

Special note—Oral contraceptives have been marketed in the United States since 1960. Reported pregnancy rates vary from product to product. The effectiveness of the sequential products appears to be somewhat lower than that of the combination products. Both types provide almost completely effective contraception.

An increased risk of thromboembolic disease associated with the use of hormonal contraceptives has now been shown in studies conducted in both Great Britain and the United States. Other risks, such as those of elevated blood pressure, liver disease and reduced tolerance to carbohydrates, have not been quantitated with precision.

Long-term administration of both natural and synthetic estrogens in subprimate animal species in multiples of the human dose increases the frequency of some animal carcinomas. These data cannot be transposed directly to man. The possible carcinogenicity due to the estrogens can be neither affirmed nor refuted at this time. Close clinical surveillance of all women taking oral contraceptives must be continued.

Indication—Ovulen and Demulen are indicated for oral contraception.

Contraindications—Patients with thrombophlebitis, thromboembolic disorders, cerebral apoplexy or a past history of these conditions, markedly impaired liver function, known or suspected carcinoma of the breast, known or suspected estrogen-dependent neoplasia and undiagnosed abnormal genital bleeding.

Warnings—The physician should be alert to the earliest manifestations of thrombotic disorders (thrombophlebitis, cerebrovascular disorders, pulmonary embolism and retinal thrombosis). Should any of these occur or be suspected the drug should be discontinued immediately.

Retrospective studies of morbidity and mortality conducted in Great Britain and studies of morbidity in the United States have shown a statistically significant association between thrombophlebitis, pulmonary embolism, and cerebral thrombosis and embolism and the use of oral contraceptives. There have been three principal studies in Britain[1-3] leading to this conclusion, and one[4] in this country. The estimate of the relative risk of thromboembolism in the study by Vessey and Doll[3] was about sevenfold, while Sartwell and associates[4] in the United States found a relative risk of 4.4, meaning that the users are several times as likely to undergo thromboembolic disease without evident cause as nonusers. The American study also indicated that the risk did not persist after discontinuation of administration and that it was not enhanced by long-continued administration. The American study was not designed to evaluate a difference between products. However, the study suggested that there might be an increased risk of thromboembolic disease in users of sequential products. This risk cannot be quantitated, and further studies to confirm this finding are desirable.

Discontinue medication pending examination if there is sudden partial or complete loss of vision, or if there is a sudden onset of proptosis, diplopia or migraine. If examination reveals papilledema or retinal vascular lesions medication should be withdrawn.

Since the safety of Ovulen and Demulen in pregnancy has not been demonstrated, it is recommended that for any patient who has missed two consecutive periods pregnancy should be ruled out before continuing the contraceptive regimen. If the patient has not adhered to the prescribed schedule the possibility of pregnancy should be considered at the time of the first missed period.

A small fraction of the hormonal agents in oral contraceptives has been identified in the milk of mothers receiving these drugs. The long-range effect to the nursing infant cannot be determined at this time.

Precautions—The pretreatment and periodic physical examinations should include special reference to the breasts and pelvic organs, including a Papanicolaou smear since estrogens have been known to produce tumors, some of them malignant, in five species of subprimate animals. Endocrine and possibly liver function tests may be affected by treatment with Ovulen or Demulen. Therefore, if such tests are abnormal in a patient taking Ovulen or Demulen, it is recommended that they be repeated after the drug has been withdrawn for two months. Under the influence of progestogen-estrogen preparations pre-existing uterine fibromyomas may increase in size. Because these agents may cause some degree of fluid retention, conditions which might be influenced by this factor, such as epilepsy, migraine, asthma, cardiac or renal dysfunction, require careful observation. In breakthrough bleeding, and in all cases of irregular bleeding per vaginam, nonfunctional causes should be borne in mind. In undiagnosed bleeding per vaginam adequate diagnostic measures are indicated. Patients with a history of psychic depression should be carefully observed and the drug discontinued if the depression recurs to a serious degree. Any possible influence of prolonged Ovulen or Demulen therapy on pituitary, ovarian, adrenal, hepatic or uterine function awaits further study. A decrease in glucose tolerance has been observed in a significant percentage of patients on oral contraceptives. The mechanism of this decrease is obscure. For this reason, diabetic patients should be carefully observed while receiving Ovulen or Demulen therapy. The age of the patient constitutes no absolute limiting factor, although treatment with Ovulen or Demulen may mask the onset of the climacteric. The pathologist should be advised of Ovulen or Demulen therapy when relevant specimens are submitted. Susceptible women may experience an increase in blood pressure following administration of contraceptive steroids.

Adverse reactions observed in patients receiving oral contraceptives—A statistically significant association has been demonstrated between use of oral contraceptives and the following serious adverse reactions: thrombophlebitis, pulmonary embolism and cerebral thrombosis.

Although available evidence is suggestive of an association, such a relationship has been neither confirmed nor refuted for the following serious adverse reactions: neuro-ocular lesions, e.g., retinal thrombosis and optic neuritis.

The following adverse reactions are known to occur in patients receiving oral contraceptives: nausea, vomiting, gastrointestinal symptoms (such as abdominal cramps and bloating), breakthrough bleeding, spotting, change in menstrual flow, amenorrhea during and after treatment, edema, chloasma or melasma, breast changes (tenderness, enlargement and secretion), change in weight (increase or decrease), changes in cervical erosion and cervical secretions, suppression of lactation when given immediately post partum, cholestatic jaundice, migraine, rash (allergic), rise in blood pressure in susceptible individuals and mental depression.

Although the following adverse reactions have been reported in users of oral contraceptives, an association has been neither confirmed nor refuted: anovulation post treatment, premenstrual-like syndrome, changes in libido, changes in appetite, cystitis-like syndrome, headache, nervousness, dizziness, fatigue, backache, hirsutism, loss of scalp hair, erythema multiforme, erythema nodosum, hemorrhagic eruption and itching.

The following laboratory results may be altered by the use of oral contraceptives: hepatic function: increased sulfobromophthalein retention and other tests; coagulation tests: increase in prothrombin, Factors VII, VIII, IX and X; thyroid function: increase in PBI and butanol extractable protein bound iodine, and decrease in T^3 uptake values; metyrapone test and pregnanediol determination.

Angina Pectoris

Recent Advances in Understanding and Implications for Management

Angina pectoris used to be a rather simple, even dull, problem which commonly confronted and not infrequently frustrated the practicing physician. His therapy was at best empirical and limited to palliative drug treatment. Now, much of this has changed. Intensive study has led to important new insights into the natural history of ischemic heart disease and its pathophysiology, the understanding of which has become critical for intelligent patient management. Simultaneously, the long-awaited appearance of a rational and promising surgical approach to this problem offers the physician an important new therapeutic option. This paper reviews recent developments in this now very exciting field, focusing upon implications of new information for the care of the patient with angina pectoris.

Natural History of Angina Pectoris

Angina pectoris is a disease syndrome defined by distinctive chest discomfort which is generally substernal, usually related to exertion and generally relieved by rest or nitroglycerin or both. The syndrome is variable in presentation, severity and prognosis. Opinions about prognosis range from "the probability of a long and useful life"[1] to "the lot of the victim of angina pectoris is not a happy one."[2] A more scientific approach to prognosis is now emerging, and some preliminary data are already available.

There are four clinical subsets of angina pectoris: (1) stable angina, (2) unstable ("preinfarction") angina, (3) variant (Prinzmetal) angina and (4) a somewhat ill-defined syndrome of angina with normal coronary arteries. These subsets have distinctly different prognoses.

Most studies of the prognosis of *stable* angina pectoris have been retrospective and have lacked details of patient selection, angiographic confirmation of diagnosis and control of the treatment administered during observation. These studies have generally found stable angina to carry an increased risk of death of 5% to 7% per year.[3] A recent report from the Framingham study[2] provides the only available prospective investigation of natural history. The study population of 5,209 residents of the community of Framingham, Mass., who range in age from 30 to 59, is presumably typical of the population at large, and the data serve as the best guideline to what a physician can expect in unselected patients with angina. Fig. 1 summarizes some of these data, as well as related data derived from other sources reviewed later in this paper. Symptomatic coronary heart disease in one of the forms shown in Fig. 1 can be expected to develop in 10% of a population followed for 14 years. Specific rates of complications and death vary with age and sex (men fare less well than

The results of an extensive review of recent literature on angina pectoris have been condensed and combined with illustrative case reports to help the practicing physician manage his patients with angina. The authors advocate an aggressive approach to such patients which is based upon new data on the natural history of angina, recently defined physiologic principles and a critical examination of advances in medical and surgical therapy. Mr. Browning and Mr. Hof are Senior Medical Students, Mr. Higgs is a Junior Medical Student and Dr. Martin is Associate Professor of Medicine and Physiology and Director, Division of Cardiology, University of Missouri School of Medicine. This work was supported in part by PHS Training Grant # TO1-HL 05787 from the National Heart and Lung Institute.

women). On the average, stable angina carries an excess mortality of 4% per year compared to individuals without angina. Among men with angina pectoris, the incidence of myocardial infarction is approximately 25% in five years, which is about twice that of women with angina and men who do not have angina. Only 23% of patients who develop myocardial infarction will have a prior warning signal of angina.[2]

Unstable angina has become the accepted term for a syndrome previously given a variety of names including acute coronary insufficiency, intermediate syndrome and preinfarction angina. Recent studies[4, 5] have cast considerable doubt upon the validity of the adjective "preinfarction," which should no longer be used. Unstable angina is defined as angina pectoris (1) of recent onset, (2) increasing frequency or severity or both or (3) occurring at rest, in a patient who shows no ECG or serum enzyme evidence of infarction. This syndrome appears to identify a group of patients whose prognosis falls between that of stable angina and acute myocardial infarction. The risk of myocardial infarction in this group of patients is approximately 20% in one year, with a one-year mortality in the range of 12% to 16%.[4, 6] An even higher risk is found in patients with sudden deterioration of chronic stable angina (mortality 19% in one year)[4] and those who continue to have frequent angina at rest despite hospitalization and intensive medical therapy (mortality, 43% in one year).[6]

Variant angina was first described by Prinzmetal.[7] Patients in this very small subset present with anginal pain at rest or during normal activity which is neither aggravated by exertion nor relieved by rest, usually lasting longer than typical angina, often occurring at about the same time each day and frequently associated with ventricular arrhythmias. The diagnostic feature of this syndrome is the presence during episodes of pain of an electrocardiographic ST vector oriented toward the ischemic area of myocardium ("ST segment elevation"[7]). Limited evidence suggests a high incidence of proximal, high-grade obstruction of a major coronary artery in these patients.[8] Patients with variant angina seem to be at extremely high risk with as many as 60% suffering myocardial infarction or death within 19 months.[8]

Another, somewhat controversial[9] subset of angina pectoris is comprised of patients with typical angina pectoris who, on coronary arteriography, have *normal* coronary arteries.[10] These patients, the majority of whom are women, may have typical ischemic electrocardiographic and metabolic responses to exercise as well. The size of this group is uncertain; some authors feel it represents as much as 10% of all patients with angina, although experience at the University of Missouri-Columbia and elsewhere[9] would suggest a figure considerably smaller than this. The course of these patients is generally benign, although there have been reports of death due to subendocardial infarction.[11]

Selective coronary arteriography provides an anatomic classification of coronary disease potentially more objective than classification by syndrome. A sufficient number of patients have been followed subsequent to coronary arteriography without operative intervention to permit preliminary conclusions regarding the prognosis of various anatomic lesions.[12, 13] The data of Moberg *et al* from the Cleveland Clinic represent the largest experience reported to date.[13] These investigators found that isolated high-grade (greater than 80%) stenosis of the right or left circumflex coronary artery carried a mortality of 12% in seven years (less than 2% per year). The mortality of isolated lesions of the left anterior descending artery was 27% to 36% in seven years (depending upon location of the stenosis distal or proximal to the first septal perforator). Stenosis of two major coronary arteries gave a seven-year mortality of 44%, while 70% of patients with stenoses of all three major vessels were dead in seven years.[13]

PATHOPHYSIOLOGY OF ANGINA PECTORIS

Angina pectoris results from myocardial ischemia. Ischemia will occur whenever the ability of the coronary vasculature to deliver oxygen fails to meet the requirements of the myocardium. Thus, ischemia (and angina) may be relieved either by improving the oxygen delivering capacity of the diseased coronaries or by decreasing the myocardial oxygen demand. The major determinants of myocardial oxygen requirements are shown in Fig. 2. They are systolic left ventricular wall tension (a function of systolic pressure and left ventricular volume), the length of time tension is exerted per cardiac cycle (ejection time), the number of beats per minute and the contractile state of the heart. The "triple product" of systolic blood pressure, heart rate and ejection time provides a rough index of the level of myocardial oxygen demand. When a patient with angina pectoris performs an activity which produces an increase in any or all of the components of the product, he will theoretically experience ischemic pain when the product exceeds his oxygen demand threshold.[14] For a given subject with stable angina, the oxygen demand threshold has been demonstrated to be quite constant. Such things as cold temperature, anxiety, postprandial state and cigarette smoking increase one or more components of the triple product as shown in Fig. 2. Thus, at a given level of physical exercise, the addition of any of these other "stresses" will result in a decreased exercise capacity.[14] These rules do not apply to variant angina which can occur without a change in triple product,[15] perhaps as a result of coronary artery spasm.[16]

MECHANISMS OF ANTI-ANGINAL DRUG ACTION

The actions of anti-anginal drugs also can be analyzed by their effects on the O_2 supply-demand relation. Two general classes of anti-anginal drugs are in common use: nitrites and beta-adrenergic blocking agents. When taken sublingually, nitrites, the prototype of which is nitroglycerine (TNG), commonly give relief of typical angina at an interval which coincides with the appearance of a significant blood concentration and demonstrable hemodynamic effects of the drug. They also can be shown to reduce electrocardiographic evidence of ischemia and improve myocardial metabolism and function during angina.[17] Given prior to exercise, they may significantly increase exercise capacity prior to the onset of pain and prevent electrocardiographic and hemodynamic changes.[14] There is evidence that oral administration of nitrites in any form is relatively ineffective.[14, 18] This appears to be due to very rapid hepatic metabolism which essentially totally clears nitrites from portal venous blood before passage into the systemic circulation.[18] The occasionally apparent effectiveness of oral nitrites probably results from placebo effects, which can be very potent in patients with chronic pain syndromes. Sufficient nitrite effect must be achieved to yield a 10 mm drop in systolic blood pressure if appreciable prophylactic effects are to be demonstrated,[14] and the patient should be warned about postural hypotension. Careful studies have failed to demonstrate any significant difference between the duration of action of sublingually administered isosorbide dinitrate (ISDN) and TNG. Each drug exerts its maxi-

mum effect at ten minutes; the effect is markedly diminished at one hour and absent within two hours of administration.[19]

As shown in Fig. 2, nitrites have several effects upon myocardial O_2 needs. They lower systolic blood pressure and reduce systemic venous return, thus decreasing left ventricular end-diastolic volume and wall stress.[14] Although effective nitrites markedly dilate proximal (conduit) coronary arteries as shown by coronary arteriography, controversy continues to exist concerning their possible role in improving oxygen supply to ischemic myocardium. Ischemia is the most potent dilator of coronary resistance vessels (arterioles) which control flow to local areas of myocardium; other vasodilators would not be expected to have any additional dilating action on such vessels when ischemia is present. However, it is possible that nitrites may dilate collateral conduit channels distal to a stenotic segment and, thus, improve perfusion of local ischemic areas.[20, 21]

Since beta-adrenergic stimulation of the myocardium markedly increases myocardial O_2 demand by increasing heart rate and contractility, there is a sound rationale for the use of beta-blockade in the treatment of angina pectoris. Presently, propranolol is the only beta-adrenergic blocking drug available in the United States. It has not been officially approved for angina pectoris, but is commonly used for this indication. Given orally to patients with coronary disease, this drug may significantly increase angina limited exercise capacity and can delay the onset of ischemic ST-T abnormalities.[22] It also may abolish the ECG and hemodynamic changes noted during ischemic attacks in patients with variant angina.[15] Propranolol appears to exert its anti-anginal effect entirely by reducing myocardial oxygen demands. As shown in Fig. 2, it reduces myocardial contractility, reduces systolic blood pressure, and slows the heart rate. Propranolol and nitrites both have effects which alone would tend to increase myocardial O_2 requirements (increased left ventricular size and tachycardia, respectively). However, as shown in Fig. 2, when used in conjunction with each other, the potentially adverse effects of each drug are cancelled by the beneficial effects of the other. The anti-anginal effects of propranolol appear to be dose-dependent[22] and doses considerably greater than those used for control of cardiac arrhythmias may be required. In general, enough drug must be given to decrease the resting pulse rate to levels between 55 and 60. Doses as high as 1,280 mg per 24 hours have been used.[22] Patients receiving propranolol should be observed closely for manifestations of congestive heart failure, which, at times, may be prevented or controlled by digitalis and diuretic therapy. Beta-adrenergic blockade is contraindicated in patients with bronchial asthma. Relative contraindications include serious chronic obstructive lung disease, and diabetes mellitus requiring either insulin or oral hypoglycemic agents because beta blockade masks the symptoms of hypoglycemia.

Surgery for Angina Pectoris

The introduction of direct coronary artery bypass grafting promises to represent a major advance in the management of patients with angina pectoris. Unlike numerous operations previously carried out for angina pectoris, the rationale for the bypass procedure is quite sound. This operation involves placement of reversed autogenous saphenous veins or internal mammary arteries or both between the ascending aorta and one or more coronary arteries distal to the point of a high-grade stenosis demonstrated by coronary arteriography. In experienced hands, aorto-coronary saphenous vein bypass carries a mortality of 2% to 10%.[23] It is reasonable to expect that even lower mortality will be experienced by groups operating on large numbers of carefully selected patients.

The following factors increase operative mortality: operating under emergency circumstances, severely limited exercise capacity and markedly reduced left ventricular ejection fraction (stroke volume/end-diastolic volume) assessed by left ventriculography.[23] The number of vessels grafted has less influence on mortality. Eighty to 90% of surviving patients will become either totally asymptomatic or experience a marked improvement in angina following this operation.[23] Most of this group also will demonstrate objective evidence of increased functional capacity or decreased ischemia at a given level of exercise, and many will return to full-time employment.

Several serious questions about this procedure remain, however. While some enthusiasts have begun to advocate this operation to prevent myocardial infarction, several groups have reported a disturbingly high incidence of myocardial infarction in the immediate postoperative period, ranging from 11%[24] to 20%.[25] One provocative recent report from Johns Hopkins Hospital has suggested an incidence of postoperative myocardial damage as high as 58%.[26] Despite the apparent frequency of this complication, patients who show evidence of postoperative myocardial infarction appear to experience a low mortality and may have a rate of postoperative improvement in angina which is comparable to that of patients who do not suffer myocardial damage.[26] Immediate patency of bypass grafts exceeds 90% in most series, and one- to two-year patency rates range from 70% to 85% for single grafts. In patients undergoing multiple grafts, the chances that all grafts will remain patent is somewhat lower.[24] Patients studied at 25 to 49 months after bypass grafting at the Cleveland Clinic had a late graft patency rate of 84%, suggesting that occlusion of grafts between years one and four may be an unusual event.[27] The long-term fate of bypass grafts and the native coronary vessels into which they are inserted remains to be determined, however.

Aorto-coronary bypass is currently indicated for patients with stable, unstable or variant angina who cannot be adequately managed with medical therapy and who have favorable coronary artery lesions and no contraindications to the procedure.[23] Although one recent report[27] provides grounds for optimism about the potential of bypass grafting to reduce the mortality of coronary disease, no carefully controlled study of the effect of this operation on prognosis has been reported, and prospective studies are only now being undertaken. Thus, there is as yet no sound experimental evidence upon which to base a recommendation to an individual patient with angina pectoris that an operation may reduce his risk of myocardial infarction or alter his risk of dying of coronary heart disease.

Management of the Patient with Angina

After establishing that a patient has angina and excluding treatable causes such as valvular heart disease and hyperthyroidism, the physician must set appropriate therapeutic goals. Prolongation of the patient's life may not yet be an attainable goal. However, palliation, which focuses only upon prevention or relief of pain, is not a sufficient goal in managing the patient with angina. The physician must deal as well with the anxiety and concern about disability or death or both which commonly accompanies the knowledge that a patient has coronary heart disease. Some patients with so-called "refractory" angina are incapacitated more by fear and uncertainty than by their episodes of exertional angina which promptly subside with rest and, in large part, may be prevented by prophylactic medication and appropriate modification of behavior. Writing a prescription for a tranquilizer requires less time but is a sorry substitute for a thorough discussion of the patient's concerns about his disease. The physician must assume a strongly positive and optimistic approach to the patient's management. Indeed, it can be argued that some of the success the surgeon has enjoyed in relieving pain and returning patients to work may be directly related to his aggressively positive approach, which may contrast with that of the physician who so often has been frustrated in his attempts to keep the angina patient functioning effectively in society.

The next steps involve favorably altering the balance between myocardial O_2 supply and demand. Attention should be given to factors such as hypertension, diabetes, abnormalities of serum lipoproteins, obesity and cigarette smoking, which may be accelerating the development of atherosclerosis or unnecessarily augmenting myocardial O_2 needs. Evaluation of the patient's life-style may find certain behavior patterns which can be modified within the framework of maintaining an active, productive and satisfying life. However, it is inexcusable to require the patient to retire from most types of work without having first exhausted other approaches to his management.

The patient should be instructed in the use of (fresh) nitroglycerine taken sublingually as liberally as necessary to provide adequate control of angina. He should be urged to use TNG at the first suspicion that he may be about to experience angina or immediately prior to activities during which he has previously encountered angina. His TNG intake should be checked frequently to detect the common phenomenon of inadequate nitrite utilization resulting from the advice of friends or relatives who have been led to fear the excessive use of the drug. If this approach does not control symptoms adequately and permit the patient to maintain an active life-style, the addition of "prophylactic" sublingual nitrites (TNG or ISDN q 1-2h) may offer some further benefit. The patient initially should experience some nitrate headache if blood levels sufficient to achieve an appreciable reduction in myocardial oxygen demand are to be achieved. Tolerance to this nitrate headache will develop, usually without tolerance to the anti-anginal effects of the drug.

If nitrites administered in this way do not provide sufficient control of angina, beta-adrenergic blockade should be induced. Assuming that no contraindications exist, a propranolol regimen is begun in a dosage of 10 mg to 40 mg qid. Appreciable sinus bradycardia may appear at this low dosage level, which rarely causes other side effects. The dose should be increased every few days until effective prevention or control of angina is achieved or unacceptable side effects limit further increase in dosage. Once adequate control of symptoms is achieved, a program of regular walking exercise often is helpful emotionally and physically. After control has been maintained for several months, it is appropriate to gradually withdraw drug therapy since an appreciable percentage of patients with stable angina may experience spontaneous remissions.[2] This may be particularly true of patients with single vessel disease, although the data upon which this statement is based are meager.[12, 28]

If adequate control of stable angina cannot be achieved with this combination of aggressive drug therapy and optimistic supportive psychotherapy, consideration should be given to surgical intervention for those patients who have no serious contraindications to open heart surgery, such as severe chronic lung disease. Coronary arteriography is required to assess operability. In addition, anatomic definition of the disease may impact significantly upon the medical management of individual patients with angina. For example, finding normal coronary arteries, with the attendant excellent prognosis for this group of patients, may serve to break a vicious cycle of anxiety and chest pain. Similarly, the demonstration of a single lesion of a right coronary artery (another favorable prognostic situation[13]) may provide the physician with needed reinforcement of his original decision to pursue medical management, making his approach to the patient more optimistic and potentially leading to enhanced therapeutic effectiveness. Conversely, the finding of high-grade stenoses of two or more proximal coronary arteries with good distal vessels in a patient about whom there otherwise may be some doubt as to the need for surgery may lend support to a surgical approach because of the apparently poor prognosis for spontaneous remission of pain[28] and the relatively high mortality of such patients without operation.[13]

Other potentially "high-risk" groups of patients warranting early arteriographic study may be identified by their clinical syndromes. For example, the patient with variant angina with demonstrable ST segment elevation during pain may be considered a particularly important candidate for arteriographic definition of his disease because of the likelihood of finding a bypassable proximal stenosis and the apparently grim prognosis for such patients.[5] The management of the patient with unstable angina is presently the subject of controversy. Although operation on all patients with unstable angina who prove to have favorable anatomic lesions cannot be justified on the basis of present prognostic data,[4] angiography may again prove useful in this group. Eighteen percent of such patients may prove to have normal coronary arteries.[29]

Although oral anticoagulants have been used for unstable (and occasionally stable) angina for many years, evidence of their efficacy in these syndromes remains unconvincing. The theoretical rationale for their use to prevent infarction is questionable since coumarin derivatives may not effectively prevent small arterial thrombi and the role of thrombosis in the genesis of myocardial infarction is controversial.[30] Since a risk of hemorrhage accompanies their use, anticoagulants currently are not generally recommended in the management of angina pectoris.

Case Reports

The following case summaries illustrate some of the points made above.

Case # 1. A 46-year-old housewife developed exertional substernal pain at the age of 32. Her mother had died of a myocardial infarction at age 48. Upon evaluation at the University of Missouri-Columbia in 1968, an exercise electrocardiogram showed equivocal ST segment depression and serum lipids were normal. Coronary arteriography was carried out for diagnostic purposes. A 75% narrowing of the left anterior descending coronary artery was demonstrated. Her angina responded to nitrite therapy, but she developed pain from ischemia in the right forearm and hand, which was relieved by a saphenous vein graft at the site of the stenosed brachial arteriotomy. In November, 1972, the frequency of her angina increased to 20 to 25 episodes per day, often while she was at rest, and frequently awakened her from sleep. She was admitted to the hospital and noted no improvement while receiving 10 mg of ISDN orally every four hours. After transfer to the cardiology service, oral nitrites were discontinued, ISDN 5 mg was given sublingually every two hours and propranolol therapy, 40 mg q 6h, was begun. That day her episodes of chest pain ceased and did not recur for the next week. When she resumed her ordinary household activities, she required 5 TNG per day, prompting an increase in propranolol to 120 mg q 6h and ISDN to 10 mg q 2h. She subsequently has experienced only an occasional episode of exertional angina which is promptly relieved by TNG, but symptoms of depression and fatigue have limited further propranolol therapy.

Comment: Coronary heart disease occasionally does occur in premenopausal women with normal serum lipoproteins. When this patient developed unstable angina, a strong case could have been made for repeat coronary arteriography and consideration of bypass surgery. However, in part because she had previously experienced one of the fortunately unusual complications of coronary arteriography, she elected to undertake an intensive medical regimen. One may speculate about whether the drugs or the aggressively positive approach adopted by a new physician was responsible for the dramatic cessation of pain. It is of interest that the patient herself commented upon the possible role of her fear of impending sudden death in the exacerbation of her angina as she approached the age at which her mother had died of a myocardial infarct.

Case # 2. A 33-year-old physician had experienced a well-documented acute anteroseptal myocardial infarction in 1969. He had returned to work and was free of symptoms until November, 1971, when he began to note episodes of substernal and epigastric distress brought on by exertion or emotional stress and generally relieved by TNG. ISDN administered sublingually and propranolol therapy were begun without appreciable effect. The combination of recurrent pain and anxiety about the significance of the pain threatened to interfere with his career, and coronary arteriography was undertaken to better define his problem. The study demonstrated total occlusion of a small diagonal branch of the left coronary artery. All other vessels, including the three major coronary arteries, appeared perfectly normal. Instillation of acid into the esophagus reproduced the patient's substernal discomfort. The highly favorable nature of the coronary arteriographic findings was discussed with him, the nitrites and propranolol were discontinued and he was treated with antacids. He experienced a dramatic remission of pain and apprehension, returned to work and remains asymptomatic.

Comment: This case illustrates the potentially therapeutic value of coronary arteriography in a patient with definite coronary heart disease. Although arteriography was carried out primarily to look for an operable lesion, the findings led to a reevaluation of the cause of his pain and to a dramatic "cure" of his problem.

Case # 3. A 41-year-old mother of 13 children was admitted to the University of Missouri-Columbia Medical Center in June, 1972 for evaluation of incapacitating exertional substernal pain. She had first experienced mild exertional angina in 1966. Physical examination was unremarkable and the electrocardiogram revealed only nonspecific ST abnormalities. An exercise electrocardiogram was equivocal, and coronary arteriography was performed. High-grade stenosis at the origin of the left anterior descending and complete occlusion of the posterior descending branch of the right coronary artery were found, but the left ventricular ejection fraction was normal. Her symptoms were controlled in the hospital with sublingual nitroglycerine, and she was discharged on a regimen of propranolol, 20 mg q 6h. Exertional angina recurred, and she began to be awakened by substernal pain. Under the care of another physician, she was given increasing amounts of meperidine and hydroxyzine and developed subcutaneous abscesses at several injection sites. She was readmitted to the Medical Center in November, 1972 and failed to respond to propranolol, 480 mg per day, and ISDN, q 2h, administered sublingually. The patient volunteered that she had become dependent upon meperidine, and narcotics were successfully withdrawn during a prolonged hospitalization required to control chest pain and permit healing of the subcutaneous abscesses prior to performing coronary artery surgery. A saphenous vein graft was anastomosed to the left anterior descending artery on Jan. 9, 1973. Her postoperative course was uneventful and she was discharged from the hospital seven days later. She is presently asymptomatic.

Comment: Some patients with angina do not respond to aggressive medical treatment. This patient illustrates the fact that addiction can complicate the management of any chronic pain syndrome. Because she had severe disease of two major coronary arteries, only one of which was bypassable, her prognosis for survival was (? is) probably quite poor. Successful coronary artery surgery appears to have improved the quality of her life. Whether it has influenced her long-term prognosis may be of secondary importance in view of the incapacitating nature of the symptoms for which the operation was performed.

Case # 4. A 52-year-old man was in good health until April, 1972, when he experienced severe chest pain while at work. He was hospitalized but no evidence of myocardial infarction was found. Type IV hyperlipoproteinemia was discovered and appropriate modification of diet was begun. Despite treatment with nitrites and propranolol, he noted incapacitating exertional angina and was admitted to the Columbia VA Hospital where coronary arteriography demonstrated high-grade stenosis of the proximal left anterior descending coronary artery. A saphenous vein bypass graft was performed on June 15, 1972. Hypotension occurred on the first postoperative day and serial electrocardiograms showed evidence of an evolving anterior myocardial infarction. Coronary arteriography was repeated on July 5, 1972. The anterior descending artery was totally occluded, and no flow could be demonstrated through the graft. A new dyskinetic segment of the anterior left ventricular wall was noted. He remained free of chest pain subsequent to discharge from the hospital, but developed mild dyspnea requiring digitalization in September, 1972. He has returned to work and remains free of chest pain and symptoms of congestive heart failure.

Comment: This patient, who is aware of the fact that postoperative graft occlusion and myocardial infarction occurred, remains asymptomatic and has personally referred several other patients with chest pain for consideration of coronary artery surgery. His course suggests that infarction of the ischemic myocardium relieved his angina. Postoperative infarction is often well-tolerated and may not significantly impair the symptomatic benefit of operation.[25, 26] The frequency of postoperative myocardial damage remains a source of concern and warrants further investigation.

Summary

Tremendous advances have been made in the understanding of angina pectoris; they are advances which have important implications for management of this disease. A scientific data base for assessing the prognosis of the individual patient with one of the anginal syndromes is beginning to emerge. Coronary arteriography may further help to define prognosis as well as evaluate operability. Aggressive, rational use of effective anti-anginal drugs, coupled with an appropriately optimistic approach by the physician, will help many patients to function effectively in society. Aorto-coronary bypass surgery gives excellent symptomatic results in selected patients who fail to respond to medical therapy. Although there is as yet no solid evidence that either medical or surgical treatment will alter the natural history of coronary heart disease, effective application of the information reviewed in this paper in many cases can make the "lot of the victim of angina pectoris"[2] a favorable one.

JOSEPH T. PARISI, Ph.D., ***Columbia***

Staphylococcus Epidermidis, An Emerging Pathogen

Although the role of *Staphylococcus epidermidis* as an etiologic agent in specific infections is difficult to assess, recent studies have shown a greater number of antibiotic-resistant cultures of this organism than *Staphylococcus aureus* in the hospital environment. As a result, *S. epidermidis* should be considered as an emerging pathogen. It is essential that contamination by *S. epidermidis* be strictly avoided and its isolation in the clinical laboratory should not be regarded lightly. Dr. Parisi is Associate Professor, Department of Microbiology, University of Missouri School of Medicine.

THE IMPORTANCE of staphylococci in disease has increased in spite of the common use of antibiotics. Although these organisms are isolated readily from the skin and mucous membranes, their potential disease-producing capabilities are based upon their ability to produce the enzyme coagulase. Although this enzyme causes citrated plasma to coagulate *in vitro*, there is no evidence that coagulase is directly involved in pathogenicity. It is commonly held that only coagulase-positive staphylococci, *Staphylococcus aureus,* should be regarded as potentially pathogenic because of their frequent isolation from disease states. On the other hand, by virtue of their ubiquitous presence in the environment and their inability to produce coagulase, coagulase-negative staphylococci, *Staphylococcus epidermidis,* have long been regarded as harmless saprophytes. Since *S. epidermidis* is found so readily in the environment, when it is isolated from a patient, it is usually regarded as a contaminant and not as an etiologic agent. However, the development of new diagnostic procedures, the complexity of surgical practices and the use of prosthetic devices have increased markedly in the past two decades, with a resulting increased incidence of staphylococcal disease due to *S. epidermidis.* Also, procedures supportive to the newborn, the elderly and other poor-risk patients, whose resistance is already lowered by extensive trauma or treatment with immunosuppressive drugs, may serve as sources of infection by *S. epidermidis.* Its association with severe infections has been observed, especially in endocarditis on prosthetic valves, in shunts implanted to alleviate hydrocephalus and in less severe infections such as urinary tract infections and wound infections. Because the parameters for its pathogenicity have not been defined, however, its role as an etiologic agent in most infections is difficult to assess.[1–4]

In our laboratory studies of the drug resistance of staphylococci isolated at the University of Missouri Medical Center showed that antibiotic-resistant cultures of *S. epidermidis* were more numerous than antibiotic-resistant cultures of *S. aureus.*[5] With 63 cultures of *S. aureus* and 63 cultures of *S. epidermidis* obtained at random from our diagnostic laboratory, the incidence of resistance to nine of 11 commonly used antibiotics was greater for *S. epidermidis* than for *S. aureus.* Furthermore, for seven of these nine antibiotics, the differences in the incidence of resistance of *S. epidermidis* was 12% or greater, as compared to those of *S. aureus.* In studies with these cultures of the minimal inhibitory concentration of clindamycin, we observed that 61 of 63 cultures of *S. aureus* were susceptible whereas only 46 of 63 cultures of *S. epidermidis* were susceptible to this relatively new antibiotic. Other studies also show the comparative antibiotic resistance of *S. epidermidis.* The isolation from clinical sources of a group of mannitol-fermenting strains of *S. epidermidis* resistant to most of the currently used antibiotics, including oxacillin, lincomycin and novobiocin, has been reported recently.[6] The only antibiotic to which all strains were sensitive was vancomycin. In another study of 200 nasal cultures of staphylococci from the general population, 83% yielded penicillinase-producing *S. epidermidis* while only 40% yielded penicillinase-producing *S. aureus.*[7] Although methicillin-resistant strains of *S. aureus* were observed in Great Britain as early as 1961 and now pose a threat in England and other European countries, very few have been reported in the United States even today.[8] On the other hand, it was observed as early as 1963 that 10% of 175 strains of S. *epidermidis* were methicillin-resistant, and this incidence of methicillin-resistance in S. *epidermidis* is observed today.[9] In an epidemiologic study in a hospital for mentally retarded children, it was found that S. *epidermidis* spread more rapidly and to a greater extent than S. *aureus* and developed a higher level of resistance to chloramphenicol than S. *aureus*. Also, chloramphenicol-resistant strains of S. *epidermidis* were found more often in both untreated and treated patients.[10] A greater frequency of antibiotic resistance among strains of S. *epidermidis* isolated from patients with infections than among isolates regarded as contaminants or from healthy carriers has been observed, also.[11]

While the antibiotic resistance of S. *epidermidis* is well-documented and readily determined, the parameters for the pathogenicity of this organism have not been defined. As a result, when S. *epidermidis* is isolated from a patient, the assessment of whether it was the primary causative agent, a secondary invader or merely a contaminant is usually uncertain. It is generally accepted that the ability of S. *aureus* to cause disease is not the result of the production of any single product but, more likely, results from the production of a combination of extracellular macromolecules or enzyme-like substances referred to as "virulence factors." The production by S. *epidermidis* of virulence factors similar to those produced by S. *aureus* has been reported by numerous investigators.[12–14] It is generally accepted that cultures of S. *aureus* can produce any combination of three different hemolysins, designated alpha, beta and delta. Alpha hemolysin is considered to be the most significant as a factor which contributes to staphylococcal infection in humans. In one study, approximately 5% of the cultures of S. *epidermidis* produced alpha, beta or delta hemolysin or a combination of these, while in another study, evidence was presented that the typical hemolysin produced by S. *epidermidis* is delta hemolysin.[12, 13] Although the production of coagulase by S. *aureus* is correlated most closely with its virulence, the *in vitro* production of several other extracellular substances has been used to identify potentially pathogenic cultures. It has been reported that 10% to 20% of cultures of S. *epidermidis* produce protease, deoxyribonuclease, staphylokinase and hyaluronidase while 50% to 70% produced alpha, beta or delta hemolysin, egg yolk factor and phosphatase.[14]

The results in our laboratory of the production by S. *epidermidis* of extracellular substances associated with virulence are in agreement with those reported by other investigators. However, the percentages of our cultures producing these substances were not as high.[5] The most common type of acute food poisoning in the United States today is due to the production of enterotoxin by S. *aureus*. Although it was commonly held that only this species of staphylococcus has the capacity to produce enterotoxin, a recent outbreak of gastroenteritis due to enterotoxin production by S. *epidermidis* has been reported.[15] After 46 characters of pathogenic coagulase-negative staphylococci were studied, it was concluded that the genus *Staphylococcus* should not be divided into two species and the inability to produce coagulase should not be used to classify a staphylococcus as S. *epidermidis*.[16] In another study of 504 clinical isolates, it was found that the production of coagulase and deoxyribonuclease was not necessarily indicative of the potential pathogenicity of staphylococci.[17]

CLINICAL SIGNIFICANCE

S. *epidermidis* should be considered an emerging pathogen and its isolation from a patient either alone or in combination with S. *aureus* should not be regarded lightly. To the contrary, its greater resistance to antibiotics in addition to its capacity to produce some virulence factors makes it imperative that cultures of S. *epidermidis* be tested carefully in the laboratory prior to administration of an antibiotic. Although an antibiotic may be effective in inhibiting S. *aureus*, it may be of little value in inhibiting S. *epidermidis*. Furthermore, as patients undergoing surgery are being subjected to more complicated procedures and the use of more prosthetic devices, it is essential that contamination by S. *epidermidis* be strictly avoided.

Psychopharmacology of the Depressive Neurosis

A Guide for the Family Practitioner

With attentive and judicious therapeutic planning in the treatment of depression, a good prognosis can be expected. This paper presents guidelines and principles to assist the physician in interpreting the results of clinical pharmacological studies,, understanding the current classification of depressions and planning a comprehensive treatment plan which stresses a supportive psychotherapeutic relationship between physician and patient. Dr. Fried is Assistant Professor and Dr. Malek-Ahmadi is a Resident in the Department of Psychiatry, University of Missouri Medical Center.

OSLER ONCE SAID that man distinguishes himself from animals by his propensity for taking drugs. The family physician knows that the giving of drugs is a symbolic act and, as such, is an important part of the doctor-patient relationship. The wise doctor recognizes the patient's need to ventilate problems and to receive reassurance.

The psychotherapeutic management of the depressed patient begins with a diagnostic assessment of the degree and severity of the impairment. The depressive neurosis is distinguished from the depressions of psychotic proportions in that the patient does not grossly misinterpret reality. The depressive neurosis also has been referred to as a reactive depression in which the patient is reacting to a currently unfavorable environmental circumstance such as the loss of a loved one or a professional failure.

From a psychodynamic point of view, depression is considered a defense against anxiety relating to conflicts over the presumed loss. Psychoanalytic theories of depression stress such concepts as the loss of self-esteem, excessive dependency needs, fear of rejection and hostility toward the loved object.

Working from a psychopharmacological point of view, some investigators have developed a hypothesis which relates changes in catecholamine metabolism to states of depression or elation. Agents which potentiate the action of CNS catecholamines function as antidepressants, while those which inactivate or deplete catecholamines centrally predispose of depression. It has been suggested, then, that some depressions and, perhaps, all are associated with a deficiency of catecholamines, especially norepinephrine, at the adrenergic synapse in the CNS, while an excess of these amines exists with behavioral states of elation.

Norepinephrine and serotonin, two monoamines which are stored and metabolized in a very similar fashion, show the same distribution in the CNS except in the limbic lobe, where a relatively higher concentration of serotonin but little norepinephrine is to be found. Norepinephrine is stored in reserve and mobile pools at the site of the synaptosome (Fig. 1). Monoamine oxidase, an enzyme, deaminates any free norepinephrine within the cytoplasm.

Free norepinephrine within the synaptic cleft is inactivated by re-uptake into the vesicle and the remainder is metabolized and converted to normetanephrine by catechol-o-methyltransferase (COMT).

Most of the normetanephrine is deaminated by MAO and converted to vanillylmandelic acid (VMA) while a portion of it is reduced to 3-methoxy, 4-hydroxyphenylglycol (MHPG). The sulfate conjugate of MHPG has been identified in cerebrospinal fluid in human subjects. It is of interest that lowered urinary MHPG excretion has been reported in depressed patients as compared to normal subjects. MHPG excretion appears to increase with clinical improvement from depression under some treatment conditions (Fig. 2).[1]

If we adhere to the catecholamine hypothesis that depression is related to low levels of norepinephrine at the receptor site, we would

expect that drugs could be effective antidepressants via the following mechanisms:

1) *Stimulation of monoamine synthesis:* Enhancing monoamine synthesis by administration of its precursor theoretically results in increased free monoamine. Since monoamines themselves do not cross the blood-brain barrier, appropriate amino acid precursors must be used. For serotonin, the precursor is L-tryptophan, while for norepinephrine, it is L-dopa which has been used effectively in Parkinson's disease.[2]

2) *Inhibition of MAO and COMT:* As mentioned above, there is a balance between two pools of norepinephrine at the synaptosome. MAO is mainly responsible for maintaining this equilibrium. Therefore, inhibition of this enzyme increases the content of the mobile pool and, consequently, increases the level of monoamine at the synaptic cleft.

Monoamine oxidase inhibitors have limited clinical use mainly because of their hepatotoxicity and the need for dietary restriction and close observation. To the authors' knowledge, no COMT inhibitor that can be used clinically has been discovered.

3) *Stimulation of monoamine release:* Those agents which promote the process of monoamine release lead to an increased level of free monoamine at the synaptic cleft. These are amphetamine and amphetamine-like compounds. Two major problems have restricted the clinical usefulness of these drugs. One is drug dependence after long-term administration and the other is rebound depression after discontinuation.

4) *Inhibition of monoamine re-uptake:* The prevention of re-uptake by any means is highly effective in increasing the synaptic monoamine. Tricyclic antidepressants which have become popular in psychiatry are thought to operate by inhibition of the process of re-uptake. However, this type of action is not limited to these agents. In fact, amphetamines and cocaine act in the same way.

TABLE 1

CLASSIFICATION OF THE DEPRESSIONS

- **I. Depressive neuroses**
- **II. Psychotic depressive reactions**
- **III. Schizo-affective disorders**
- **IV. Major affective disorders**
  - **A. Manic-depressive illnesses**
  - **B. Involutional melancholias**

If a clinician is to interpret the results of clinical pharmacological studies or plan an appropriate course of treatment, it would be helpful if he were familiar with the current classification of the depressions (Table 1). We would agree with Schildkraut[3] that "the classifications of the depressions devised thus far are, at best, preliminary and limited solutions to a major problem in psychiatry."

Systematic investigations into the symptomatology of the depressive disorders have highlighted what Beck[4] refers to as the core signs and symptoms of depression (Table 2). The reader will note that the core signs and symptoms of depression are conceptualized as (1) physical, (2) cognitive, (3) emotional and (4) motivational. No attempt is made to distinguish between neurotic and psychotic depressions on phenomenological or psychodynamic grounds.

TABLE 2

CORE SIGNS AND SYMPTOMS OF DEPRESSION

- **I. Physical and Vegetative**
  - **1. Anorexia**
  - **2. Sleep disturbance**
  - **3. Autonomic symptoms**
  - **4. Constipation**
  - **5. Shift of sexual desires (decrease or increase)**
  - **6. Fatigability**
- **II. Cognitive**
  - **1. Poor concentration**
  - **2. Suicidal thoughts**
  - **3. Delusions**
  - **4. Distorted self-image**
- **III. Emotional**
  - **1. Dejected mood**
  - **2. Crying spells**
  - **3. Self-abasement**
  - **4. Loss of gratification**
  - **5. Detachment from friends and family**
  - **6. Feelings of inadequacy**
- **IV. Motivational**
  - **1. Loss of interest in professional and personal activities**
  - **2. Negative expectations**
  - **3. Loss of positive motivation**
  - **4. Increased dependency needs**

Depressed patients seen in medical practice frequently present with symptoms suggestive of physical illness. A careful anamnesis may reveal a change in mood which patients attribute to their physical problems. Severe localized or generalized pain may be the focus of the patients' concern. However, physical examination may fail to account for the symptom or if there are positive findings, they may be discordant with the magnitude of the patients' complaints.

Depressed patients do not always report a subjective change in mood. In Beck's series, only 53% of patients suffering from mild depression acknowledged feeling unhappy or sad in spite of core signs and symptoms of depression. Kennedy and Wiesel[5] coined the term "depressive equivalents" in their description of patients with somatic complaints typical of those seen in depressive disorders, yet who did not present with the characteristic alteration of mood. Such patients who present with depressive equivalents are said to suffer from "masked depression." Although the majority of complaints are of a psychological nature, many are medical. Typical complaints are: "headaches," "upset stomach," "breathing difficulty," and "pain all over."

It is important that the clinician guards against dismissing the physical complaints of depressed persons as neurotic symptoms. As a general principle in every case in which a patient presents with core signs and symptoms suggestive of a depressive disorder, contributing physical factors should be kept in mind. A careful examination is in order to rule out a depression secondary to medical problems, e.g., endocrine disturbances, neoplasms, vascular disease, Parkinsonism and many others.

We would agree with Appleton[6] that it is imperative that the clinician distinguish between fact and fancy when formulating a rational plan for the psychotherapeutic management of the depressed patient. We stress that although drugs can be valuable in the treatment of the major affective disorders, the treatment of choice for the neurotically depressed patient is a supportive psychotherapeutic relationship between the physician and the patient. Persons suffering from depressive neuroses are often refractory to antidepressant drugs. Klein[7] states that although most patients suffering from depressive neuroses are refractory to the major antidepressants, an occasional patient shows marked benefit when placed on a tricyclic drug or a MAO inhibitor. Grosser and Freeman,[8] in their studies of the differential recovery patterns of depressed patients, indicate a high placebo response rate in the depressive neuroses.

The drug industry reifies Paul Ehrlich's concept of the "magic bullet" and perpetuates a myth in which a particular drug acts selectively on a specific target symptom. Thus, "specific psychotropic drugs are described as directly altering specific emotional states and effecting specific psychological processes. . . . Hence Librium is claimed to 'reduce anxiety'; Compoz to 'calm the nerves'; and Elavil to 'lift depression.' "[9]

The physician who succumbs to such advertising may contribute to the contemporary trend of dealing with problems of living by an escape through the ingestion of drugs. In this regard, Lennard cautions that "the pharmaceutical industry, in its communication with physicians, all too often practices mystification in relabeling an increasing number of human and personal problems as medical problems." They cite Pillard's testimony before Congress in which he testified that drug advertisements often imply "that antidepressant therapy is indicated in the griefs of everyday life" and are "part of a trend to suggest the use, both of antidepressants and tranquilizers, not only for specific mental illness but to soothe life's ordinary woes."

The physician who treats the patient suffering from a depressive neurosis with amphetamines in the morning and barbiturates at night runs the risk of fostering an iatrogenic intoxication, provides his patient with a suicidal weapon and may expose the patient to a possible amphetamine psychosis.[10] Target symptoms such as insomnia or anxiety may be judiciously treated with sedatives or "minor" tranquilizers. It should be recognized, however, that the temporary relief that they afford may be tempered by their side effects, for all drugs act not only on multiple behavioral levels but on various biochemical systems.

Antidepressant drug therapy should be considered a valuable adjunct to a comprehensive treatment plan which stresses a supportive psychotherapeutic relationship between physician and patient. To the depressed patient, an attitude of confidence and optimism on the part of the physician is comforting and reassuring. Since improvement is the rule rather than the exception in the treatment of depression, with attentive and judicious therapeutic planning, there is every reason to expect a good prognosis.

Chronic Lymphocytic Leukemia, Disseminated Histoplasmosis and Pneumococcal Septicemia

Case Report

PATIENTS with chronic lymphocytic leukemia frequently manifest defects in both cellular and humoral immunity.[1] Consequently, they may acquire infections characteristic of both types of defect. Coexistent fungal and bacterial infections in the immunologically defective patient may pose diagnostic pitfalls.

In the following case report, the presenting complaint was fever of unknown origin. The dramatic demonstration of fungi in peripheral blood neutrophiles allayed enthusiasm for continuing search for other etiologic agents. After brief improvement with antifungal therapy the patient succumbed to a bacterial septicemia.

CASE REPORT

A 71-year-old farmer's wife was transferred to the University of Missouri-Columbia Medical Center because of chills and fever. Four years previously, a diagnosis of chronic lymphocytic leukemia had been made on the basis of a white blood cell count of 78,400 that was 90% lymphocytes. The patient was asymptomatic until seven months prior to admission when she noted malaise and lymphadenopathy. Three weeks before admission, nightly fever, chills and sweats began. The patient had been hospitalized and treated with 60 mg of prednisone for five days and a seven-day course of cephalothin without effect on her fever before being transferred to the Medical Center.

On admission, her temperature was 103.4 F; pulse rate was 96; and respiration rate was 16. Physical findings included ecchymoses over the left lower leg and at venipuncture sites, three ulcerations of the palate measuring 0.5 cm in diameter and covered by green-gray exudate, cervical and axillary lymphadenopathy and a palpable splenic tip but no hepatomegaly.

Histoplasma capsulatum yeast forms were identified within the cytoplasm of neutrophiles in the peripheral blood (Fig. 1). Significant laboratory studies included a white blood cell count of 131,000, 99% of which were small lymphocytes. Platelet count was 40,000/cu mm and the hematocrit reading was 33%. Serum total protein was 6.8 gm%; albumin was 2.3 gm%. Quantitative immunoglobulins were IgG 2.2 gm% (normal: 0.9-1.5 gm%); IgA 0.3 gm% (normal: 0.17-0.41 gm%); IgM .09 gm% (normal: 0.05-0.11 gm%). Spinal fluid showed no organisms on India ink examination. Chest X-ray was within normal limits. The bone marrow contained sheets of lymphocytes compatible with the diagnosis of chronic lymphocytic leukemia. *H. capsulatum* yeast forms were present in marrow histiocytes. Cultures of blood, spinal fluid and bone marrow all produced growth of *H. capsulatum*. No other organisms were cultured.

The patient was treated with increasing daily intravenous doses of Amphotericin B, beginning with 1 mg, proceeding to 5 mg, then to 10 mg, 20 mg and, on the day of her death, 30 mg. Prednisone, 60 mg daily, was continued. On the second hospital day, oozing occurred at venipuncture sites. Fundoscopic examination revealed multiple fresh fundal hemorrhages. The platelet count was 32,000/cu mm; fibrinogen 200 mg%; partial thromboplastin time 37/30 (patient/control expressed in seconds); prothrombin time 14/12; thrombin time 22/17; and fibrin split products were not detected. The patient received 6 units of platelet concentrates; 15,000 units of heparin intravenously every six hours

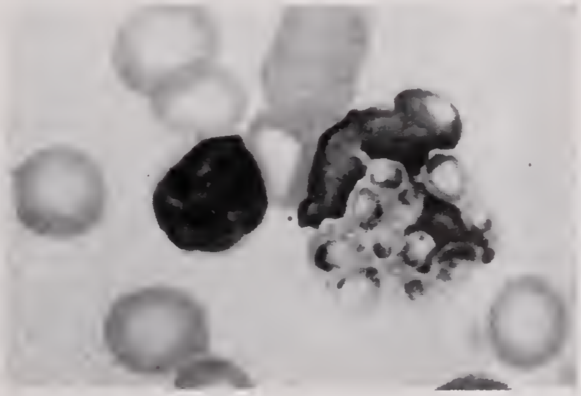

Fig. 1 ***Histoplasma capsulatum*** **organisms in a peripheral blood neutrophil (Wright's stain × 1200).**

Both cellular and humoral immunity may be defective in patients with chronic lymphocytic leukemia. The patient discussed in this paper had *Histoplasma capsulatum* demonstrated in peripheral blood neutrophiles. After brief improvement on antifungal therapy, she rapidly succumbed to *Pneumococcal* septicemia. Continual evaluation of these patients is crucial because of the possibility of coexistent fungal and bacterial infections. Drs. Hahn, Barnes and Sandberg are from the Department of Pathology and Dr. Lerner is from the Department of Medicine, University of Missouri School of Medicine.

were initiated for presumed disseminated intervascular coagulation. There was no further bleeding.

Her hospital course over the first four days was characterized by gradual reduction of fever, improvement of her mental status and good urine output. *H. capsulatum* continued to be present in her peripheral blood neutrophiles. On the fifth hospital day, a 105 F fever spike occurred. She rapidly became hypotensive with a marked decrease in urinary output. Cyanosis ensued and the patient died.

Postmortem examination revealed extensive lymphocytic infiltration of the spleen (510 gm), liver (1,710 gm), kidneys (right 200 gm, left 210 gm), lymph nodes and bone marrow. There also was heavy infiltration of the subendocardium, lungs and gastrointestinal tract. The spleen and lymph nodes were massively infiltrated by lymphocytes. Germinal centers had been obliterated, but there were occasional small foci of necrosis associated with localized plasma cell infiltrates. *H. capsulatum* organisms were numerous in swollen reticuloendothelial cells in the lungs, spleen, liver, lymph nodes and bone marrow. The lungs showed bilateral fibrinous pneumonitis. *Diplococcus pneumoniae* organisms were present in large number within vessels of all sizes in all of the tissue examined. Disseminated intravascular coagulation was manifested by small fibrin thrombi in many pulmonary arterioles, multiple recent, small infarcts of kidneys, liver and spleen and thrombosis of the left radical of the portal vein. Cultures of pericardial pleural and ascitic fluid, heart blood, lung, spleen and brain were obtained at postmortem. All of these grew *D. pneumoniae. H. capsulatum* did not grow from the postmortem specimens.

COMMENT

Patients with lymphoreticular diseases, such as chronic lymphocytic leukemia, have poor immunologic defenses.[2] They may have reduced primary and secondary antibody responses, qualitatively defective antibodies and some loss of delayed hypersensitivity. Anergic response to agents normally stimulating delayed hypersensitivity has been reported.[1] Infections occurring in patients with these defects of both cellular and humoral immunity may be caused by bacteria, fungi, viruses and protozoa.[2] Disseminated histoplasmosis occurs in patients with the leukemia-lymphoma group of diseases and those undergoing steroid therapy.[3–5] Rapid diagnosis is essential in these debilitated patients with compromised host defenses. Amphotericin B, the effective agent for therapy, has marked toxicity necessitating diagnosis before treatment is begun. Culture or histologic study of bone marrow, liver, sputum or buccal mucosa are the usual methods of proving the diagnosis.[6] Only rarely is the diagnosis of disseminated histoplasmosis made by identifying the yeast forms in the peripheral blood.[7–9]

The continual evaluation of these patients is crucial. Sudden deterioration may mean a worsening of the underlying disease, ineffective treatment of histoplasmosis or the presence of yet another microorganism. This patient illustrates and emphasizes the last category, coexisting fungal and bacterial infections in patients with chronic lymphocytic leukemia.

Triaminic
For your patient with a spring cold or allergy...
Triaminic Tablets relieve a stuffy, runny nose and get him out in the sun.

Triaminic®

phenylpropanolamine hydrochloride, pyrilamine maleate, pheniramine maleate

"the Sunshine Tablet"

Formula: Each timed-release tablet contains phenylpropanolamine hydrochloride, 50 mg.; pyrilamine maleate, 25 mg.; pheniramine maleate, 25 mg. **Indications:** Relief from such symptoms as nasal congestion, profuse nasal discharge and postnasal drip associated with colds, nasal allergies, sinusitis and rhinitis. **Precautions:** Patients should not drive a car or operate dangerous machinery if drowsiness occurs. Use with caution in the presence of hypertension, hyperthyroidism, cardiovascular disease, or diabetes. **Side Effects:** Occasional drowsiness, blurred vision, cardiac palpitations, flushing, dizziness, nervousness or gastrointestinal upsets. **Dosage:** Adults—one tablet swallowed whole, in morning, midafternoon and before retiring. **Availability:** In bottles of 100, 250.

optional therapy

THE mudranes®

All Mudranes are bronchodilator-mucolytic in action, and are indicated for symptomatic relief of bronchial asthma, emphysema, bronchiectasis and chronic bronchitis. **MUDRANE tablets** contain 195 mg. potassium iodide; 130 mg. aminophylline; 21 mg. phenobarbital (Warning: may be habit-forming); 16 mg. ephedrine HCl. **Dosage** is one tablet with full glass of water, 3 or 4 times a day. **Precautions** are those for aminophylline-phenobarbital-ephedrine combinations. **Iodide side-effects:** May cause nausea. Very long use may cause goiter. Discontinue if symptoms of iodism develop. **Iodide contraindications:** Tuberculosis; pregnancy (to protect the fetus against possible depression of thyroid activity). **MUDRANE-2 tablets** contain 195 mg. potassium iodide; 130 mg. aminophylline. **Dosage** is one tablet with full glass of water, 3 or 4 times a day. **Precautions** are those for aminophylline. **Iodide side-effects and contraindications are listed above. MUDRANE GG tablets** contain 100 mg. glyceryl guaiacolate; 130 mg. aminophylline; 21 mg. phenobarbital (Warning: may be habit-forming); 16 mg. ephedrine HCl. **Dosage** is one tablet with full glass of water, 3 or 4 times a day. **Precautions** are those for aminophylline-phenobarbital-ephedrine combinations. **MUDRANE GG-2 tablets** contain 100 mg. glyceryl guaiacolate; 130 mg. aminophylline. **Dosage** is one tablet with full glass of water, 3 or 4 times a day. **Precautions:** Those for aminophylline. **MUDRANE GG Elixir.** Each teaspoonful (5 cc) contains 26 mg. glyceryl guaiacolate; 20 mg. theophylline; 5.4 mg. phenobarbital (Warning: may be habit-forming); 4 mg. ephedrine HCl. **Dosage:** Children, 1 cc for each 10 lbs. of body weight; one teaspoonful (5 cc) for a 50 lb. child. Dose may be repeated 3 or 4 times a day. Adult, one tablespoonful, 4 times daily. All doses should be followed with ½ to full glass of water. **Precautions:** See those listed above for Mudrane GG tablets.

MUDRANE—original formula
First choice

MUDRANE-2
When ephedrine is too exciting or is contraindicated

MUDRANE GG
During pregnancy or when K.I. is contraindicated or not tolerated

MUDRANE GG-2
A counterpart for Mudrane-2

MUDRANE GG ELIXIR
For pediatric use or where liquids are preferred

Clinical specimens available to physicians.

Yeshiva University

I think that there can be a very great distinction between generic drugs and brand name drugs. And that applies to products of original research that have outlived their patent protection as well as to drugs that have long been in the public domain. Let me explain why.

The Importance of the Manufacturing Environment

In terms of formulation, quality control, and the ability to reproduce an essentially identical product, batch after batch, I doubt that many firms are properly equipped to put out a product that is as carefully controlled as the product marketed by a pharmaceutical company with sophisticated research and high quality manufacturing facilities. For example, when a company comes out with its own preparation of a drug that has just lost its patent protection, there is no assurance that the drug it produces will be a therapeutic equivalent. The raw material could be identical and yet bioavailability might vary from complete unavailability to that which is equivalent to the original.

It Isn't Enough to Meet USP and NF Standards

Meeting USP and NF standards is not enough to guarantee therapeutic equivalence. In certain instances, stricter standards must be applied. Right now, the New York Heart Association has a committee that is studying the problem of digoxin equivalency. I am certain that they are going to recommend a bioavailability assay of a particular digoxin. Unless this is done, they will not recommend it for purchase or use in New York City hospitals. It represents too much of a hazard. They have gone so far as to recommend a batch-by-batch certification of bioavailability even though the company has been reproducing and marketing a digoxin product through the years.

The Problem of Controlling Bioavailability of Generics

The FDA does not have the manpower to inspect the quality control capabilities of hundreds of houses specializing in generic products. And I don't think that the average pharmacist is knowledgeable or aware of the quality and bioavailability of the infinite numbers of generic preparations. A recommendation has been made that every time a generic house (or for that matter a large pharmaceutical company) markets an already existing drug for the first time, a modified new drug application should be submitted. The manufacturer would have to show that his compound is the therapeutic equivalent of the standard compound in use, assuming that the standard compound is one that has been available for an extended period—say 15 years. This would be one indication that the control of bioavailability is beginning to get the attention that it deserves.

Clinical Predictabilit
More Important Than P

Growing Awareness of Potential for Nonequivalence

s experience increases
h drug substances de-
ed from different sources
under different condi-
ns, it should be possible
stablish specifications in
ficient detail to minimize
potential for their non-
uivalence. However,
re is general agreement
at product therapeutic
uivalence would still not
assured even if one could
minimize nonequivalence of drug components produced by different manufacturers. Arguments relate largely to the extent of product inequivalences. Experience over the past six years has uncovered a greater incidence of nonequivalence of products prepared by different manufacturers from generically equivalent substances than many had previously surmised.

Newer Bioavailability Studies Reveal Differences

Bioavailability may be defined as a measure of the rate and amount of absorption of a drug substance from its administered dosage form. For several years pharmaceutical scientists have proposed that bioavailability data on presumably equivalent dosage forms provide the best measure of product equivalence—short of adequate clinical trial. In their continued search for shortcuts to the evaluation of product equivalence, medical and pharmaceutical scientists have increasingly relied upon bioavailability characteristics as reflected by blood levels of a drug after its administration to human subjects.

Leading manufacturers now conduct comparative bioavailability studies on their own product dosage forms after production process changes that would have been considered inconsequential a few years ago. This isn't surprising, since there are so many possible differences in production operations that the opportunities for inequivalent generic and brand name products are numerous—even when the production process begins with identical chemical substances. Moreover, reputable manufacturers are striving to improve *in vitro* control measures, such as dissolution characteristics, which are being related more meaningfully to bioavailability reference data.

As a result of advances in scientific instrumentation and analytical methodology which permit measurements of small quantities of drug substances in the body, our abilities to detect differences in bioavailability and possible therapeutic nonequivalance have appreciably improved.

Product Selection Based on Patient Response

Improved specifications and standards can better assure the equivalence of *drug substances*. Manufacturers, compendia and regulatory agencies can all play a part. However, it is the *drug product*, not the *drug substance*, that the physician, pharmacist, nurse and patient-customer utilize. How can these individuals make or influence specific product selections to minimize variations in therapeutic equivalence of multisource drugs? Patients' responses to a drug product provide a basis of experience to aid the physician in his selection of a particular product. The nurse and pharmacist can also help detect patient responses, but ultimate responsibility must remain with the physician.

Reputation of Manufacturer as Basis for Product Selection

The physician, to assure that his patients receive quality health care, must rely upon the capabilities of the reputable pharmaceutical manufacturer who is equipped to develop, prepare and control a quality product of uniform, reliable therapeutic performance. Substitution with purportedly equivalent generic products that are only superficially evaluated by an imitator manufacturer can place the health of the patient secondary to factors of price or convenience for the provider.

Opinion & Dialogue

What is your opinion, doctor?
We would welcome your comments.

Integument!

Our skin—the human integument—covers us, defines us, protects us. But skin is subject to cuts, burns, abrasions. And infections. Neosporin Ointment fights infection by providing broad antibacterial action against susceptible skin invaders. It contains antibiotics that are rarely used systemically, reducing the risk of sensitization.

INDICATIONS: *Therapeutically*, used as an adjunct to appropriate systemic therapy for topical infections, primary or secondary, due to susceptible organisms, as in: • infected burns, skin grafts, surgical incisions, otitis externa • primary pyodermas (impetigo, ecthyma, sycosis vulgaris, paronychia) • secondarily infected dermatoses (eczema, herpes, and seborrheic dermatitis) • traumatic lesions, inflamed or suppurating as a result of bacterial infection.

Prophylactically, the ointment may be used to prevent bacterial contamination in burns, skin grafts, incisions, and other clean lesions. For abrasions, minor cuts and wounds accidentally incurred, its use may prevent the development of infection and permit wound healing.

CONTRAINDICATIONS: Not for use in the external ear canal if the eardrum is perforated. This product is contraindicated in those individuals who have shown hypersensitivity to any of the components.

PRECAUTION: As with other antibiotic preparations, prolonged use may result in overgrowth of nonsusceptible organisms and/or fungi. Appropriate measures should be taken if this occurs. Articles in the current medical literature indicate an increase in the prevalence of persons allergic to neomycin. The possibility of such a reaction should be borne in mind.

Complete literature available on request from Professional Services Dept. PML.

NEOSPORIN® Ointment

(POLYMYXIN B-BACITRACIN-NEOMYCIN)

Each gram contains: Aerosporin® brand Polymyxin B Sulfat 5,000 units; zinc bacitracin 400 units; neomycin sulfate 5 m (equivalent to 3.5 mg. neomycin base); special white petrolatu q.s. In tubes of 1 oz. and ½ oz. and $\frac{1}{32}$ oz. (approx.) foil packet

President's Message

What do the MSMA and the AMA do for ME? I would gladly trade in my Keogh Plan money for $1 for each time I have been asked that question in the past year.

On March 8-11, 25 Missourians attended the AMA Political Action meeting in Washington, D. C. As is customary, we were briefed for three hours on Friday morning, March 9, by eight members of the AMA office in Washington. Out of this session came the following facts and predictions: (1) There is a PSRO task force implemented by the AMA and complemented by the American Hospital Association and the American Nursing Home Association. Dr. Hector W. Benoit, Jr. of Kansas City is a member. (2) Dr. John R. Kernodle testified before a congressional committee on January 15. He pointed out that all doctors had stayed beneath the 2.5% Phase II deadline. (3) The AMA's present goal is to obtain more signers for the Medicredit Bill than all the other programs together. At the present time there are 171 Congressional sponsors of Medicredit out of a possible 400.

Walter T. Gunn, M.D.

At noon, we sponsored a luncheon for the Senators and Congressmen from Missouri. Of the total of 12, five attended personally and six, who were out of town, sent staff representatives. We were greatly encouraged by their comments. All agreed that the doctor is more knowledgeable in health affairs than anyone else. They opined that there will be some health legislation in 1974. Any HHI bill will be a compromise between the Kennedy Bill and Medicredit. As one AMA speaker warned, "Don't forget. A compromise between one inch and one mile is one-half mile which is a long way from one inch." Also, enactment of the Kennedy Bill would mean the death of "The Blues" and the Health and Hospitalization Industry.

The big question regarding HMO legislation is "If HMO's provide such a better and more economic manner of practicing medicine, why do they require a $5 billion subsidy?" The Physicians Placement Service reported more than 4,500 registrations with 3,100 placements. Nobody is surprised that the largest physician surplus was in surgery; the largest opportunity surplus was in family practice.

A NHI will be consummated in 1974. How often have I been told "I'm too busy." Your livelihood and existence are at stake in the next 18 months. They will be determined in the Congress of the United States. KNOW AND SUPPORT YOUR CONGRESSMEN. HEW is in the throes of reorganization. Contact your Representative and express your feelings.

Woman's Auxiliary

It has been said that our days are all the same size, like identical suitcases. It's just that some people can pack more into them than others.

If this idea is applied to years, as well as days, I believe you'll agree that the members of our county medical society auxiliaries and your MSMA Woman's Auxiliary should be congratulated for being the greatest "year packers" of them all.

Mrs. Keith D. Jones
President

Here is a partial review of their accomplishments in 1972-1973:

- First *Legislative Day*—Members of the Auxiliary from all parts of the state gathered in Jefferson City to visit the Missouri House of Representatives and Senate, entertain members of the House and Senate Public Health committees at luncheon, visit with representatives of their individual districts and tour the historic Governor's Mansion.
- First *Health Education Day*—The MSMA Woman's Auxiliary was the first state auxiliary to sponsor a Health Education Day. This event was held in conjunction with our annual Fall Conference in Columbia and was co-sponsored by the MSMA Council. Representatives from 70 other state organizations were invited to participate. The program is now being offered by the AMA Auxiliary as a pattern for other state auxiliaries.
- First *Public Affairs and MMPAC Chairmanship*—Mrs. James A. (Pat) Reid of Marshall served in this first chairmanship in the Woman's Auxiliary. We report more than a 1,000% increase in our AMPAC-MMPAC memberships for the year. The Auxiliary also held a mid-winter board meeting and participated in the MSMA Public Affairs Conference in Jefferson City.
- *Cooperation*—Better working relationships and communications with the MSMA Council were established. Appointed members of the Woman's Auxiliary will attend meetings of the MSMA Council and certain MSMA commissions and committees.

Actually, there are too many Auxiliary activities and projects to report on this page. Among them are the Auxiliary's participation in AMA Auxiliary programs, participation in the organization of the Missouri Uterine Task Force and continuation of work on behalf of health careers and drug education.

It has been an inspiring and rewarding year. As President of the Woman's Auxiliary, I extend my deep appreciation to the MSMA Officers and Council, the staff in Jefferson City and the members of the Auxiliary for their interest and invaluable cooperation and salute the auxiliary members for accomplishing so much in one year.

EDITORIALS

CHANGE IS ETERNAL!

While most of us would agree with the above, the majority of physicians tend to be passive rather than active in what is going on in the world around them. During the past year, the St. Louis County Medical Society has shown change in that the meeting pattern reverted to monthly gatherings, most of which were well attended, especially where the personal interests of the physicians were concerned.

In hospital corridors, social gatherings and wherever physicians meet, there is talk of "socialized medicine, the changing order of things, take over by universities, HMOs and now HR-1." My personal experience in such gatherings has been only to hear various mutterings from physicians, sometimes regretful and sometimes angry. "It is easy to criticize Senator Kennedy and others seeking social change, but mere disagreement is in no way constructive or helpful."

It is a rare experience for doctors to get together and help make the wheel go in the direction it should, namely, in such a way that it will benefit not only the practice of medicine but directly benefit the community.

Many doctors have become too busy to attend to the matters above and to a large degree have abdicated these functions to social scientists and politicians. Texas Congressman Burleson recently observed that doctors do not write their congressmen. The legislators ARE interested! In addition to writing congressmen, much more would be accomplished by active participation in your medical society so that knowledgeable forces could guide and assist those concerned with health care problems.

It is true that the American physician is held in high esteem by the community. This status must be preserved and we physicians can help preserve it by moving in a positive direction. We must not ignore the problems that exist in the practice of medicine. It will only antagonize the consumer rather than help the cause of the physician if we are obstructive rather than constructive.

Let us, as physicians, unite and use the already present and potentially powerful frameworks of the medical societies, both local and national, to express our views. Since change IS eternal, let us, as interested and dedicated physicians, be forces in change for the better, not only for our profession, but for all people.

JACK R. EIDELMAN, M.D., St. Louis
St. Louis County Medical Society Bulletin

AMA LEGISLATIVE DEPARTMENT—A VITAL SERVICE

The American Medical Association's Legislative Department provides a vital service to member physicians all across the country. At the same time, it is regarded by many as one of the most substantial of the intangible benefits which the AMA offers to its membership.

The Legislative Department staffs the AMA Council on Legislation and specializes in all phases of national legislation. After studying, analyzing and interpreting all Congressional legislation pertaining to medical and health care, the department makes available this information to state, county and specialty medical societies, members of the public and other organizations. This usually totals about 2,300 bills of medical interest per Congress. An increased responsibility of this department is the critical review of government regulations which often seriously affect application of law. There are few physicians who could devote the time necessary to accomplish this on their own and, yet, this information is vital because it affects the way medicine is practiced in this country.

To keep key medical leadership aware of legislative developments when Congress is in session, the department writes, publishes and distributes *Legislative Round-Up* weekly to approximately 5,000 key state, county and specialty medical society officers.

Another vital activity is the assistance given to AMA Officers in the preparation of testimony and presentations for Congressional hearings. The Legislative Department works with the appropriate AMA scientific personnel to gain the benefit of their expertise before assembling any presentation. The Council on Legislation can then use this resource material to formulate a sound recommendation as to the best policy position for the AMA. Many people do not realize the AMA is often requested to testify because its views are valued not only by Congress but by the various governmental agencies.

The department also assists in the development, writing and presentation of draft legislation for consideration by members of Congress, such as the AMA's own national health insurance bill, MEDI-

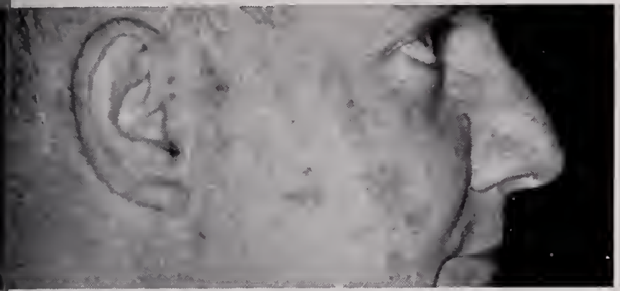
What's
on your
patient's
face...

may be more important than
his chief complaint

e lesions on his face may
solar/actinic—so-called
nile" keratoses...and
ey may be premalignant.

lar, actinic or senile keratoses

ese lesions may be called by several names, but they
ally can be identified by the following character-
cs: the typical lesion is flat or slightly elevated, of a
wnish or reddish color, papular, dry, rough, adherent,
sharply defined. They commonly occur as multiple
ons, chiefly on the exposed portions of the skin.



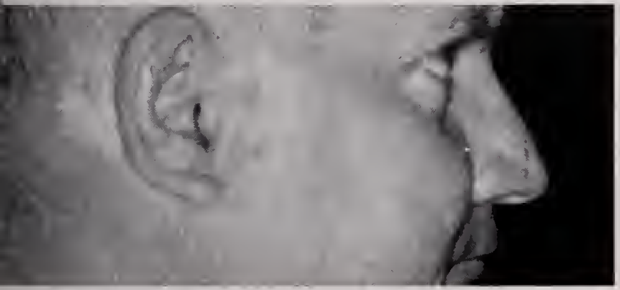
tient P.T. seen on 3/29/67 shows typical lesions of
derately severe keratoses. Note residual scarring on
ge of nose from previous cryosurgical and electro-
gical procedures.*

equence of therapy/ lectivity of response

er several days of therapy with Efudex® (fluorouracil),
thema may begin to appear in the area of the lesions;
reaction usually reaches its height of unsightliness
d discomfort within two weeks, declining after dis-
ntinuation of therapy. This reaction occurs in affected
as. Since the response is so predictable, lesions that
not respond should be biopsied.

cceptable results

eatment with Efudex provides highly favorable cos-
tic results. Incidence of scarring is low. This is
rticularly important with multiple facial lesions.
udex should be applied with care near the eyes, nose
d mouth.



atient P.T. seen on 6/12/67, seven weeks after discon-
uation of 5%-FU cream. Reaction has subsided.
esidual scarring not seen except for that due to prior
rgery. Inflammation has cleared and face is clear of
ratotic lesions.*

ata on file, Hoffmann-La Roche Inc., Nutley, N.J.

Before prescribing, please consult complete product information, a summary of which follows:

Indications: Multiple actinic or solar keratoses.
Contraindications: Patients with known hypersensitivity to any of its components.
Warnings: If occlusive dressing used, may increase inflammatory reactions in adjacent normal skin. Avoid prolonged exposure to ultraviolet rays. Safe use in pregnancy not established.
Precautions: If applied with fingers, wash hands immediately. Apply with care near eyes, nose and mouth. Lesions failing to respond or recurring should be biopsied.
Adverse Reactions: Local—pain, pruritus, hyperpigmentation and burning at application site most frequent; also dermatitis, scarring, soreness and tenderness. Also reported—insomnia, stomatitis, suppuration, scaling, swelling, irritability, medicinal taste, photosensitivity, lacrimation, leukocytosis, thrombocytopenia, toxic granulation and eosinophilia.
Dosage and Administration: Apply sufficient quantity to cover lesion twice daily with nonmetal applicator or suitable glove. Usual duration of therapy is 2 to 4 weeks.
How Supplied: Solution, 10-ml drop dispensers—containing 2% or 5% fluorouracil on a weight/weight basis, compounded with propylene glycol, tris(hydroxymethyl)aminomethane, hydroxypropyl cellulose, parabens (methyl and propyl) and disodium edetate.
Cream, 25-Gm tubes—containing 5% fluorouracil in a vanishing cream base consisting of white petrolatum, stearyl alcohol, propylene glycol, polysorbate 60 and parabens (methyl and propyl).

This patient's lesions were resolved with

CREDIT. They also assist in the development of presentations to the regulatory agencies.

The staff participates in providing legislative orientation to the AMA's Councils and Committees as well as to members of the profession who are in Washington, D. C. to visit members of Congress.

Finally, the department has undertaken the monitoring of state legislation with a view towards eventually assisting the profession to attain its legislative goals on a state as well as on a national level.

From Medicaid and Medicare regulations to chiropractic issues, national health insurance and appropriations for HEW programs, federal and state medical and health care legislation affects all physicians in some way. The AMA's Legislative Department maintains constant surveillance and provides AMA physician policy makers with accurate and up-to-date information. The leadership of organized medicine can make their judgments and represent AMA's membership with a sound base of resources.

Ninth Councilor District Holds Annual Meeting

Physicians and their wives from 14 South Central Missouri counties attended the annual meeting of the MSMA Ninth Councilor District on February 28 at Holiday Inn in West Plains.

Dr. Claude W. Cooper of Thayer, Ninth District Councilor, presided at the dinner and meeting. Special guests were Walter T. Gunn, M.D., St. Louis, President of the Missouri State Medical Association; E. A. Stricker, St. James, President-Elect; and Mrs. Keith D. Jones, Warrensburg, President of the Woman's Auxiliary to the MSMA.

Guest speakers from the University of Missouri-Columbia were Paul R. Young, M.D., Medical Director of Continuing Education for Health Professions; Daniel Winship, M.D., Professor of Medicine and Chief of the Department of Gastroenterology; and Guilio J. Barbero, M.D., Professor and Chairman of the Department of Pediatrics. Each discussed subjects related to his respective department.

Dr. Gunn spoke to the group and discussed medical information on the state level.

Counties in the Ninth District of the MSMA are Carter, Crawford, Dent, Douglas, Howell, Laclede, Maries, Oregon, Ozark, Phelps, Pulaski, Shannon, Texas and Wright.

Five National Otolaryngology Societies Meet in St. Louis

Five national otolaryngology societies will hold their annual scientific meetings on April 1-7 at the Chase-Park Plaza Hotel in St. Louis.

The American Broncho-Esophagological Association; American Laryngological Association, Inc.; American Academy of Facial Plastic and Reconstructive Surgery, Inc.; American Laryngological, Rhinological and Otological Society, Inc. (The Triological Society); and American Otological Society, Inc. will participate in this series of meetings which will constitute the largest national congress this year devoted exclusively to scientific advances in otolaryngology.

More than 1,000 otolaryngologists have been attending the sessions held consecutively to avoid schedule overlap.

FIRST DISTRICT

COUNCILOR
JOHN N. MARTIN, M.D., ST. JOSEPH

Buchanan County Medical Society

The annual "Heart" meeting of the Buchanan County Medical Society was held in the Empire Room of Hotel Robidoux in St. Joseph on February 7.

Following the dinner, Dr. Bernard S. Lipman, Atlanta, Ga., spoke on "Controversies in the Management of Heart Attacks—1973." A native of St. Joseph who is now practicing cardiology in Atlanta, Dr. Lipman has written texts on cardiology which are now in use in various medical schools. A graduate of Washington University School of Medicine, he has served as associate professor of clinical medicine at Emory University School of Medicine; director of the Heart Station of St. Joseph Hospital; codirector of Glenville Giddings Heart Clinic; visiting physician and consultant in cardiology at the Grady Memorial Hospital; area consultant in cardiology to the Veterans Administration; and consultant in cardiology to the U. S. Department of Health, Education and Welfare in Atlanta.

Dr. Lipman was introduced by Dr. Wallace McDonald, who recently began practicing in St. Joseph following a residency in internal medicine at Emory University Medical School in Atlanta.

G. Tyson Carpenter, M.D., *Secretary*

Clay County Medical Society

Dr. Daniel C. Boone was installed as President and Dr. Felix A. Pileggi was installed as President-Elect of Clay County Medical Society at the Annual Presidents' Dinner at Rodeway Inn in North Kansas City on January 30.

Immediate Past-President Paul Revare presided at the annual event which was attended by 56 members and guests.

Other officers installed for the new year are Drs. Richard C. Hedges, Vice-President; Emmet K. Burke, Secretary-Treasurer; Donald A. Fakhoury, Robert J. Gauer and Carl R. Slaughter, Executive Committee; Philip E. King, Van M. Robinson and Lawrence L. Hayes, Board of Censors.

Delegates to the MSMA Annual Session are Drs. Richard P. Bowles, Chris K. Fotopoulos and Donald E. Kuenzi. Alternate Delegates are Drs. Truman B. Schertz, Richard C. Hedges and Charles I. Fowler.

MSMA Assistant Executive Secretary Royal O. Cooper *(center)* with Retiring President Paul Revare *(left)* who installed President Daniel Boone *(right)* at the Clay County Medical Society Annual Presidents' Dinner.

Guest speaker for the evening was MSMA Assistant Executive Secretary Royal O. Cooper who reviewed bills now before the Missouri House of Representatives and Senate.

Dr. Schertz reported on HB 314 concerning the use of nonlicensed technicians in the doctor's office. Mrs. William McPhee discussed "Meals on Wheels," a hospital auxiliary program which delivers one meal a day to handicapped and housebound residents.

Emmet K. Burke, M.D., *Secretary*

COUNCILOR
LYSLE M. BACH, M.D., HANNIBAL

Chariton-Macon-Monroe-Randolph County Medical Society

The regular monthly meeting of the Chariton-Macon-Monroe-Randolph County Medical Society was held on February 8 in the library of Woodland Hospital in Moberly.

Dr. Robert H. Young, President, presided. Guests at the meeting were Dr. Walter T. Gunn, St. Louis, President of the Missouri State Medical Association; Dr. Lachance, Centralia; MSMA Executive Secretary Raymond McIntyre and Mrs. McIntyre; and Assistant Executive Secretary Royal O. Cooper of Jefferson City.

Dr. Robert V. Tompson, Secretary, notified members of correspondence relative to proposed constitutional changes of the MSMA Council Report and a request from Dr. E. D. Imes, Speaker of the House of Delegates, for resolutions.

President Young then introduced Dr. Gunn who spoke on activities of the MSMA. He pointed out many recent activities in which the Association has been engaged.

Mr. Cooper then presented an update of current legislative proposals now before the Missouri Legislature and Senate.

Mr. McIntyre discussed various recent changes in the MSMA Journal and referred to the up-to-the-minute news supplement which is now inserted in each copy.

Members present were Drs. F. L. Harms and D. D. Stuart, Chariton County; James Campbell and Don Eggleston, Macon County; F. A. Barnett, Monroe County; Josephine Baker, W. D. Chute, C. C. Cohrs, L. E. Huber, R. V. Tompson and R. H. Young, Randolph County.

Robert V. Tompson, M.D., *Secretary*

Missouri Surgeons' Meeting Scheduled for June 1-2

The Missouri Chapter of the American College of Surgeons will hold its annual professional meeting on June 1-2 at the Crown Center Hotel in Kansas City.

Papers will be presented by some of Missouri's outstanding physicians. A tour of Children's Mercy Hospital in Kansas City will be a feature of the program this year.

The Missouri Chapter's professional meeting is open to all members of the medical profession. To be in attendance, reservations should be made for the nights of May 31 and June 1. Reservations for both family and guests of members of the Chapter will be welcomed.

Missouri Medicine in Review

FORTY YEARS AGO

Dr. Rudolph V. Powell, St. Louis, was one of 24 physicians elected to membership in the American College of Physicians on February 6 during the annual clinical session in Montreal.

The 76th Annual Session of the MSMA will convene in Kansas City on May 1-4. Eminent men who have contributed much to the advancement of medical science in their respective fields will be guests of the Association. They are Dr. Charles A. Elliott, Chicago, professor of medicine at Northwestern University School of Medicine; Dr. Arnold S. Jackson, Madison, Wis.; Dr. Peter C. Kronfeld, Chicago, associate professor of ophthalmology at the Graduate School of Medicine, Division of the Biological Sciences, University of Chicago; and Dr. J. Gordon Wilson, Chicago, professor of otology and laryngology at Northwestern University School of Medicine.

The April clinic of the Kansas City Southwest Clinical Society will be held on April 11 at St. Joseph's Hospital in Kansas City. The morning program will consist of presentations of case reports of colon disease. The distinguished guest will be Dr. Joseph W. Larimore, St. Louis, assistant professor of clinical medicine, Washington University School of Medicine.

TWENTY-FIVE YEARS AGO

The National Health Service Act in Great Britain is scheduled to become effective on July 5. On February 28, the *Journal of the American Medical Association* carried the following editorial concerning the situation:

"The British Medical Association opposes the National Health Service Act as the first and irrevocable step toward a whole time state medical service. In Great Britain, as in this country, the national medical care plan is offered as a health service instead of what it actually is—a system which would eventually bring every physician into government employment. The *British Medical Journal* has inspired British physicians to stand firm in their opposition to such enslavement."

The top leaders in county society memberships in the Missouri State Medical Association for 1947 are St. Louis Medical Society, 1,275; Jackson County, 634; St. Louis County, 243; Greene County, 112; Buchanan County, 103; Jasper County, 65; Boone County, 47; Ozark Medical Society (Barry, Christian, Lawrence, Stone, Taney), 42.

Garrett Pipkin, M.D., Kansas City, received a certificate of merit at the meeting of the American Academy of Orthopedic Surgery held on January 21-27 in Chicago.

The South Central Counties Medical Society met for dinner on February 20 at the Antlers Cafe in Mountain Grove with the following members and visitors present: Drs. J. R. Mott, Hartville; J. A. Fuson, Mansfield; L. T. Van Noy, Norwood; R. W. Denney, H. G. Frame and A. C. Ames, Mountain Grove; Garrett Hogg, Jr., Cabool; T. J. Burns, Houston; Leslie Randall, Licking; C. F. Callihan, Willow Springs; E. C. Bohrer and Rollin H. Smith, West Plains; and Guy D. Callaway and G. S. Pierce, Springfield.

TEN YEARS AGO

Federico Adler, M.D., Kansas City, has become a member of Jackson County Medical Society. Dr. Adler is a native of Austria, received his preliminary education at Colegio, Mejia, Quito, Ecuador, and his M.D. degree at Central Universidad, Quito, in 1954.

At a recent meeting, Rollin H. Smith, M.D., West Plains, was elected chief-of-staff of the medical board of the West Plains Memorial Hospital. Jack Wiles, M.D., was elected secretary.

The staff of Sisters Hospital in St. Joseph recently elected Dr. John L. Mothershead as President and Dr. Irwin Rosenthal as Secretary-Treasurer.

At a recent meeting of the American College of Radiology, Dr. Kenneth C. Hollweg, Kansas City, was one of 60 radiologists to be a Fellow of the organization.

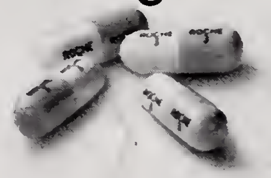
How strong must a tranquilizer be for severe anxiety?

As strong as Librium® 25 mg
(chlordiazepoxide HCl)

The achievement of desired therapeutic results is often a function of the dosage *strength* as well as the drug's intrinsic action. Thus, when anxiety is *severe*, the 25-mg strength of Librium frequently provides the necessary antianxiety action with a minimum of unwanted adverse reactions. Librium 25 mg is a convenient dosage form for the relief of severe, incapacitating anxiety, specifically formulated to supplement your counsel and reassurance.

Benefits-to-risks ratio permits higher dosage



For over 13 years, Librium has been recognized for its excellent benefits-to-risks ratio, an asset in the *higher* dosage ranges as in more common clinical applications. Thus, the frequency of dosage with Librium 25 mg can be flexibly adjusted to the needs and response of the individual patient, up to 100 mg daily if required. Total daily dosage for the elderly and debilitated should not exceed 20 mg. When severe anxiety has been reduced, Librium dosage should be correspondingly reduced or discontinued entirely.

basic support in severe anxiety
Librium® 25 mg
(chlordiazepoxide HCl)
1 capsule t.i.d./q.i.d.

ROCHE

Roche Laboratories
Division of Hoffmann-La Roche Inc
Nutley, N J 07110

Before prescribing, please c
plete product information, a sum
which follows:

Indications: Relief of anxiety
occurring alone or accompanying v
states.

Contraindications: Patients
hypersensitivity to the drug.

Warnings: Caution patients a
combined effects with alcohol and o
depressants. As with all CNS-acting
patients against hazardous occupati
complete mental alertness (*e.g.*, ope
ery, driving). Though physical and
dependence have rarely been report
mended doses, use caution in admir
addiction-prone individuals or thos
increase dosage; withdrawal sympt
convulsions), following discontinu
drug and similar to those seen with
have been reported. Use of any drug
lactation, or in women of childbearing age requ
that its potential benefits be weighed against it
possible hazards.

Precautions: In the elderly and debilitat
and in children over six, limit to smallest effec-
tive dosage (initially 10 mg or less per day) to
preclude ataxia or oversedation, increasing gra
ally as needed and tolerated. Not recommende
in children under six. Though generally not re
ommended, if combination therapy with other
psychotropics seems indicated, carefully consic
individual pharmacologic effects, particularly
use of potentiating drugs such as MAO inhibi
and phenothiazines. Observe usual precaution
presence of impaired renal or hepatic functior
Paradoxical reactions (*e.g.*, excitement, stimula
and acute rage) have been reported in psychiat
patients and hyperactive aggressive children.
Employ usual precautions in treatment of anx
states with evidence of impending depression
suicidal tendencies may be present and protect
measures necessary. Variable effects on blood
coagulation have been reported very rarely i
patients receiving the drug and oral anticoagu
lants; causal relationship has not been establis
clinically.

Adverse Reactions: Drowsiness, ataxia
confusion may occur, especially in the elderly
debilitated. These are reversible in most insta
by proper dosage adjustment, but are also occa
sionally observed at the lower dosage ranges.
few instances syncope has been reported. Also
countered are isolated instances of skin erupti
edema, minor menstrual irregularities, nau
constipation, extrapyramidal symptoms, incr
and decreased libido—all infrequent and gene
controlled with dosage reduction; changes in
patterns (low-voltage fast activity) may appe
during and after treatment; blood dyscrasias (
cluding agranulocytosis), jaundice and hepati
dysfunction have been reported occasionally,
ing periodic blood counts and liver function
advisable during protracted therapy.

Supplied: Librium® Capsules containi
5 mg, 10 mg or 25 mg chlordiazepoxide HCl
Libritabs® Tablets containing 5 mg, 10 mg or
25 mg chlordiazepoxide.

116th MSMA Annual Session
April 4-7, 1974 Kansas City

Everybody experiences psychic tension.

Most people can handle this tension.

Some people develop excessive psychic tension and need your counselin

and a few may need counseling
and the psychotropic action of Valium® (diazepam).

Before deciding to make Valium
zepam) part of your treatment
n, check on whether or not the
ient is presently taking drugs
l, if so, what his response has
en. Along with the medical and
ial history, this information can
p you determine initial dosage,
possibility of side effects and
ultimate prospects of success
failure.

While Valium can be a most
pful adjunct to your counseling,
hould be prescribed only as long
excessive psychic tension per-
s and should be discontinued
en you decide it has accom-
shed its therapeutic task. In
neral, when dosage guidelines
followed, Valium is well
erated (see Dosage). For con-
nience it is available in 2-mg, 5-mg
d 10-mg tablets.

Drowsiness, fatigue and ataxia
ve been the most commonly re-
rted side effects.

Until response is determined,
tients receiving Valium should
cautioned against engaging in
zardous occupations requiring
mplete mental alertness, such
driving or operating machinery.

ROCHE
Roche Laboratories
Division of Hoffmann-La Roche Inc.
Nutley, N.J. 07110

Before prescribing, please consult complete product information, a summary of which follows:

Indications: Tension and anxiety states; somatic complaints which are concomitants of emotional factors; psychoneurotic states manifested by tension, anxiety, apprehension, fatigue, depressive symptoms or agitation; symptomatic relief of acute agitation, tremor, delirium tremens and hallucinosis due to acute alcohol withdrawal; adjunctively in skeletal muscle spasm due to reflex spasm to local pathology, spasticity caused by upper motor neuron disorders, athetosis, stiff-man syndrome, convulsive disorders (not for sole therapy).

Contraindicated: Known hypersensitivity to the drug. Children under 6 months of age. Acute narrow angle glaucoma; may be used in patients with open angle glaucoma who are receiving appropriate therapy.

Warnings: Not of value in psychotic patients. Caution against hazardous occupations requiring complete mental alertness. When used adjunctively in convulsive disorders, possibility of increase in frequency and/or severity of grand mal seizures may require increased dosage of standard anticonvulsant medication; abrupt withdrawal may be associated with temporary increase in frequency and/or severity of seizures. Advise against simultaneous ingestion of alcohol and other CNS depressants. Withdrawal symptoms (similar to those with barbiturates and alcohol) have occurred following abrupt discontinuance (convulsions, tremor, abdominal and muscle cramps, vomiting and sweating). Keep addiction-prone individuals under careful surveillance because of their predisposition to habituation and dependence. In pregnancy, lactation or women of childbearing age, weigh potential benefit against possible hazard.

Precautions: If combined with other psychotropics or anticonvulsants, consider carefully pharmacology of agents employed; drugs such as phenothiazines, narcotics, barbiturates, MAO inhibitors and other antidepressants may potentiate its action. Usual precautions indicated in patients severely depressed, or with latent depression, or with suicidal tendencies. Observe usual precautions in impaired renal or hepatic function. Limit dosage to smallest effective amount in elderly and debilitated to preclude ataxia or oversedation.

Side Effects: Drowsiness, confusion, diplopia, hypotension, changes in libido, nausea, fatigue, depression, dysarthria, jaundice, skin rash, ataxia, constipation, headache, incontinence, changes in salivation, slurred speech, tremor, vertigo, urinary retention, blurred vision. Paradoxical reactions such as acute hyperexcited states, anxiety, hallucinations, increased muscle spasticity, insomnia, rage, sleep disturbances, stimulation have been reported; should these occur, discontinue drug. Isolated reports of neutropenia, jaundice; periodic blood counts and liver function tests advisable during long-term therapy.

Dosage: Individualize for maximum beneficial effect. *Adults:* Tension, anxiety and psychoneurotic states, 2 to 10 mg b.i.d. to q.i.d.; alcoholism, 10 mg t.i.d. or q.i.d. in first 24 hours, then 5 mg t.i.d. or q.i.d. as needed; adjunctively in skeletal muscle spasm, 2 to 10 mg t.i.d. or q.i.d.; adjunctively in convulsive disorders, 2 to 10 mg b.i.d. to q.i.d. *Geriatric or debilitated patients:* 2 to 2½ mg, 1 or 2 times daily initially, increasing as needed and tolerated. (See Precautions.) *Children:* 1 to 2½ mg t.i.d. or q.i.d. initially, increasing as needed and tolerated (not for use under 6 months).

Supplied: Valium® (diazepam) Tablets, 2 mg, 5 mg and 10 mg; bottles of 100 and 500. All strengths also available in Tel-E-Dose® packages of 1000.

Valium®
(diazepam)

To help you manage excessive psychic tension

Sally's back in sew biz! After an arthritic flare-up.

t Note. This drug is not a simple analgesic. Do
nister casually. Carefully evaluate patients be-
ting treatment and keep them under close su-
). Obtain a detailed history, and complete
and laboratory examination (complete hemo-
inalysis, etc.) before prescribing and at fre-
ervals thereafter. Carefully select patients,
those responsive to routine measures, contra-
l patients or those who cannot be observed fre-
Warn patients not to exceed recommended
Short-term relief of severe symptoms with the
possible dosage is the goal of therapy. Dosage
e taken with meals or a full glass of milk. Sub-
ka capsules for tablets if dyspeptic symptoms
atients should discontinue the drug and report
tely any sign of: fever, sore throat, oral lesions
ms of blood dyscrasia); dyspepsia, epigastric
nptoms of anemia, black or tarry stools or other
e of intestinal ulceration or hemorrhage, skin re-
significant weight gain or edema. A one-week
iod is adequate. Discontinue in the absence of a
le response. Restrict treatment periods to one
patients over sixty.
ons: Acute gouty arthritis, rheumatoid arthritis,
toid spondylitis.
ndications: Children 14 years or less; senile pa-
istory or symptoms of G.I. inflammation or ul-
including severc, recurrent or persistent dys-
history or presence of drug allergy; blood
ias; renal, hepatic or cardiac dysfunction; hy-
ion; thyroid disease; systemic edema,
tis and salivary gland enlargement due to the
olymyalgia rheumatica and temporal arteritis;
receiving other potent chemotherapeutic
or long-term anticoagulant therapy.
gs. Age, weight, dosage, duration of therapy, ex-
of concomitant diseases, and concurrent potent
herapy affect incidence of toxic reactions. Care-
struct and observe the individual patient, espe-
e aging (forty years and over) who have
ed susceptibility to the toxicity of the drug. Use
effective dosage. Weigh initially unpredictable
against potential risk of severe, even fatal, re-
The disease condition itself is unaltered by the

ursing mothers. Drug may appear in cord blood
ast milk. Serious, even fatal, blood dyscrasias,

Butazolidin® alka Geigy

Each capsule contains:
100 mg. phenylbutazone USP
100 mg. dried aluminum hydroxide gel USP
150 mg. magnesium trisilicate USP

If it doesn't work in a week, forget it.

including aplastic anemia, may occur suddenly despite regular hemograms, and may become manifest days or weeks after cessation of drug. Any significant change in total white count, relative decrease in granulocytes, appearance of immature forms, or fall in hematocrit should signal immediate cessation of therapy and complete hematologic investigation. Unexplained bleeding involving CNS, adrenals, and G.I. tract has occurred. The drug may potentiate action of insulin, sulfonylurea, and sulfonamide-type agents. Carefully observe patients taking these agents. Nontoxic and toxic goiters and myxedema have been reported (the drug reduces iodine uptake by the thyroid). Blurred vision can be a significant toxic symptom worthy of a complete ophthalmological examination. Swelling of ankles or face in patients under sixty may be prevented by reducing dosage. If edema occurs in patients over sixty, discontinue drug.
Precautions: The following should be accomplished at regular intervals: Careful detailed history for disease being treated and detection of earliest signs of adverse reactions; complete physical examination including check of patient's weight; complete weekly (especially for the aging) or an every two week blood check; pertinent laboratory studies. Caution patients about participating in activity requiring alertness and coordination, as driving a car, etc. Cases of leukemia have been reported in patients with a history of short- and long-term therapy. The majority of these patients were over forty. Remember that arthritic-type pains can be the presenting symptom of leukemia.
Adverse Reactions: This is a potent drug, its misuse can lead to serious results. Review detailed information before beginning therapy. Ulcerative esophagitis, acute and reactivated gastric and duodenal ulcer with perforation and hemorrhage, ulceration and perforation of large bowel, occult G.I. bleeding with anemia, gastritis, epigastric pain, hematemesis, dyspepsia, nausea, vomiting and diarrhea, abdominal distention, agranulocytosis, aplastic anemia, hemolytic anemia, anemia due to blood loss including occult G.I. bleeding, thrombocytopenia, pancytopenia, leukemia, leukopenia, bone marrow depression, sodium and chloride retention, water retention and edema, plasma dilution, respiratory alkalosis, metabolic acidosis, fatal and nonfatal hepatitis (cholestasis may or may not be prominent), petechiae, purpura without thrombocytopenia, toxic pruritus, erythema nodosum, erythema multiforme, Stevens-Johnson syndrome, Lyell's syndrome (toxic necrotizing epidermolysis), exfoliative dermatitis, serum sickness, hypersensitivity angiitis (polyarteritis), anaphylactic shock, urticaria, arthralgia, fever, rashes (all allergic reactions require prompt and permanent withdrawal of the drug), proteinuria, hematuria, oliguria, anuria, renal failure with azotemia, glomerulonephritis, acute tubular necrosis, nephrotic syndrome, bilateral renal cortical necrosis, renal stones, ureteral obstruction with uric acid crystals due to uricosuric action of drug, impaired renal function, cardiac decompensation, hypertension, pericarditis, diffuse interstitial myocarditis with muscle necrosis, perivascular granulomata, aggravation of temporal arteritis in patients with polymyalgia rheumatica, optic neuritis, blurred vision, retinal hemorrhage, toxic amblyopia, retinal detachment, hearing loss, hyperglycemia, thyroid hyperplasia, toxic goiter, association of hyperthyroidism and hypothyroidism (causal relationship not established), agitation, confusional states, lethargy; CNS reactions associated with overdosage, including convulsions, euphoria, psychosis, depression, headaches, hallucinations, giddiness, vertigo, coma, hyperventilation, insomnia, ulcerative stomatitis, salivary gland enlargement. (B)98-146-070-G

Serious side effects do occur. Select patients carefully (particularly the elderly) and follow them closely in line with the drug's precautions, warnings, contraindications and adverse reactions.

For complete details, including dosage, please see full prescribing information.

What should a medication for sleep be expected to provide?

Before prescribing Dalmane (flurazepam HCl), please consult Complete Product Information, a summary of which follows:

Indications: Effective in all types of insomnia characterized by difficulty in falling asleep, frequent nocturnal awakenings and/or early morning awakening; in patients with recurring insomnia or poor sleeping habits; and in acute or chronic medical situations requiring restful sleep. Since insomnia is often transient and intermittent, prolonged administration is generally not necessary or recommended.

Contraindications: Known hypersensitivity to flurazepam HCl.

Warnings: Caution patients about possible combined effects with alcohol and other CNS depressants. Caution against hazardous occupations requiring complete mental alertness (*e.g.*, operating machinery, driving). Use in women who are or may become pregnant only when potential benefits have been weighed against possible hazards. Not recommended for use in persons under 15 years of age. Though physical and psycholog
dependence have not been reported o
recommended doses, use caution in ad
ministering to addiction-prone individ
or those who might increase dosage.

Precautions: In elderly and debilitated
initial dosage should be limited to 15 m
to preclude oversedation, dizziness an
or ataxia. If combined with other drugs
having hypnotic or CNS-depressant
effects, consider potential additive effe
Employ usual precautions in patients
who are severely depressed, or with

Sleep for 7 to 8 hours without need to repeat dosage during the night

No sleep medication has been as rigorously evaluated in the sleep research laboratory as Dalmane. Insomnia patients given one 30-mg capsule of Dalmane at bedtime, on average: fell asleep within 17 minutes, had fewer nighttime awakenings, spent less time awake after sleep onset, and slept for 7 to 8 hours with no need to repeat dosage during the night.

Sleep with consistency

Dalmane (flurazepam HCl) has been shown to be consistently effective even during consecutive nights of administration. Thus there is little likelihood for the need to increase dosage to maintain therapeutic effect.

Dalmane is in a class by itself. Not a narcotic, barbiturate or methaqualone, Dalmane is the only available benzodiazepine specifically indicated for insomnia.

Sleep with relative safety

Chronic tolerance studies have confirmed the relative safety of Dalmane (flurazepam HCl); no depression of cardiac or respiratory function was noted in patients administered recommended or higher doses for as long as 90 consecutive nights. In most instances when adverse reactions were reported they were mild, infrequent and seldom required discontinuance of therapy. Morning "hang-over" with Dalmane has been relatively infrequent. Dizziness, drowsiness, lightheadedness and the like have been the side effects noted most frequently, particularly in the elderly and debilitated. (An initial dose of Dalmane 15 mg should be prescribed for these patients.)

When your evaluation of insomnia indicates the need for a sleep medication, consider Dalmane—a single entity agent proved effective and relatively safe for relief of insomnia.

DALMANE®
(flurazepam HCl)
When restful sleep is indicated

One 30-mg capsule *h.s.*—usual adult dosage
(15 mg may suffice in some patients).
One 15-mg capsule *h.s.*—initial dosage for elderly or debilitated patients.

depression or suicidal tendencies. ic blood counts and liver and kid- nction tests are advised during ed therapy. Observe usual precau- n presence of impaired renal or c function.

se Reactions: Dizziness, drowsi- ightheadedness, staggering, ataxia ling have occurred, particularly rly or debilitated patients. Severe on, lethargy, disorientation and probably indicative of drug intoler- r overdosage, have been reported. Also reported were headache, heartburn, upset stomach, nausea, vomiting, diarrhea, constipation, GI pain, nervousness, talkativeness, apprehension, irritability, weakness, palpitations, chest pains, body and joint pains and GU complaints. There have also been rare occurrences of sweating, flushes, difficulty in focusing, blurred vision, burning eyes, faintness, hypotension, shortness of breath, pruritus, skin rash, dry mouth, bitter taste, excessive salivation, anorexia, euphoria, depression, slurred speech, confusion, restlessness, hallucinations, and elevated SGOT, SGPT, total and direct bilirubins and alkaline phosphatase. Paradoxical reactions, *e.g.*, excitement, stimulation and hyperactivity, have also been reported in rare instances.

Dosage: Individualize for maximum beneficial effect. *Adults:* 30 mg usual dosage; 15 mg may suffice in some patients. *Elderly or debilitated patients:* 15 mg initially until response is determined.

Supplied: Capsules containing 15 mg or 30 mg flurazepam HCl.

of Drugs

Insurance rates and hospital ges are only two factors in health care costs. The cost of drugs—both prescription and nonprescription—is another.

And when it comes to drug costs, the nation's pharmacists *are concerned*. Through their national professional society, the American Pharmaceutical Association, pharmacists are advising the public to use nonprescription medication cautiously and conservatively, and to seek the advice of their pharmacist before selecting or purchasing such drugs.

Outdated Laws

The pharmacist also is aware that when it comes to prescription drugs, often he has an even greater opportunity to reduce the cost to the patient—with no sacrifice in the quality of the medication dispensed. But in many states, outdated and antiquated laws prevent the pharmacist from engaging in drug product selection. "Drug product selection" simply means that the pharmacist functions in the patient's interest by consciously choosing, from the multiple brands available, a low-cost quality brand of the specific drug to be dispensed in response to the physician's prescription order.

Much *misinformation* has been purposely spread by those who stand to gain financially by maintaining high drug costs to the public. An endless stream of propaganda has emanated from the drug industry in an effort to persuade the medical profession that these so-called anti-substitution laws should be retained. And as long as these laws are retained, the drug industry will continue its current marketing practices which contribute unnecessarily to high drug costs to patients. These practices also are inviting government agencies to expand their restrictive controls on physicians and pharmacists.

APhA Efforts

As pharmacists, we are concerned about health care costs. We hope that every physician shares our concern on this vital issue, and will give his personal support to the constructive efforts APhA has undertaken in the interest of all patients.

(For a complete discussion of drug product selection, you are invited to request a free copy of the "White Paper on the Pharmacist's Role in Product Selection" from: American Pharmaceutical Association, 2215 Constitution Avenue, N.W., Washington, D.C. 20037.)

---

drugs that he selects to treat the rity of conditions encountered in ractice. Moreover, the physi- 's choice of a specific brand is d on his knowledge of the pa- 's medical history and current ition, and his experiences with articular manufacturer's luct.

Some substitution proponents argued that the dispensing of a cription is a simple two-party saction between the pharmacist the patient, and that a substitut- harmacist may avoid even a nical breach of contract by simply fying the patient that he is making substitution. I would judge that courts would be sympathetic ard a pharmacist who substituted out physician approval and who ertook a legal defense that seeks ake the patient responsible for pharmacist's actions.

uced Prescription Prices?

Substitution advocates are gesting to the consumer, and par- larly the consumer activist, that uced prescription prices could w legalization of substitution. have seen absolutely no evidence stify this claim. To the contrary, erience in Alberta, Canada, where stitution is authorized, suggests the opposite.

Many pharmacists understandably are concerned about the cost of maintaining multiple stocks of similar products. While there is no doubt that inventory costs rise when additional brands are stocked, it would be interesting to know how much they rise, and how many pharmacists actually stock *all* brands—of, say, ampicillin or tetracycline—or how long they keep "slow moving" products on their shelves before they are returned for credit. To ask that the industry eliminate multiple sources is to ask competitors to stop competing.

Drug Substitution—A License for the Unethical

Anti-substitution repeal would favor "corner cutting" pharmacists and manufacturers. For them, free substitution would be not a right, but a license. As an aftermath, it is quite likely that the confidence of both physicians and patients in the profession of Pharmacy would be eroded, as revelations about the unconscionable behavior of an undisciplined few were magnified in the press or in professional circles.

Summary

In short, what the American Pharmaceutical Association advocates as a broad-spectrum panacea looks to us to be not only a minority view (advocacy of substitution is by no means a uniform policy in Pharmacy), but also an extraordinarily costly and ineffective remedy, whose side effects are odious. We believe (1) that an impressive majority of pharmacists prefer to work with Medicine and with industry, for the consumer, and for the general good, (2) that they seek the privilege to substitute when the patient might gain and when the patient's doctor agrees, and (3) that they seek to work for the resolution of genuine grievances openly and professionally.

(For amplification of PMA views, please write for our booklet, "The Medications Physicians Prescribe: Who Shall Determine the Source?" It is available from: Pharmaceutical Manufacturers Association, 1155 Fifteenth Street, N.W., Washington, D.C. 20005.)

MSMA

NEWS

ROUND - UP

MAY, 1973

Summary of House actions

udent delegates seated at Session

ight medical students took seats as delegates full voting rights during the 115th Annual sion of the Missouri State Medical Association, rch 29 — April 1, in St. Louis.

long with voting to seat student delegates, the ise approved By-Law changes affecting the nner in which Resolutions are introduced and ignating the Speaker and Vice-Speaker as delees-at-large.

However, the House declined to take a definite ition on physicians' guilds, Professional Standls Review Organizations and abortions.

The MSMA became the seventh state in the U.S. seat medical students with its action at the sion. The students, two from each of Missouri's r medical schools, are to be certified by the n of the school. The first students voting in the MA House were: University of Missouri-Conbia, Arlin Lockard and John Brandt; University Missouri-Kansas City, Ms. Pat Hubble and rlin Brown; St. Louis University, R. M. Rutkow d John P. Jones; Washington University, James rton and Barry Farber.

The By-Law change concerning Resolutions uires that Resolutions must be received at the sociation office 45 days prior to the opening sion of the House for publication in the Handok. Resolutions to be introduced after that time ist be made available to the House 24 hours fore the session in which it will be introduced d 200 copies, or funding for such, must be supied by the sponsor.

The Speaker and Vice-Speaker were made legates-at-large because under previous Byaws it would have been possible that the two ficers would not have been elected as Delegates their local societies.

Discussion of a recommendation that the MSMA prove the formation of the Missouri Physicians' uild was one of the dominating features of the ssion.

The Commission on Medical Economics, Third arty Medicine and Governmental Relations and Ad Hoc Committee on Negotiation of Profesonal Fees both submitted reports recommending pproval of the Guild.

Robert E. Bregant, M.D.
Fifth District Councilor

E. A. Stricker, M.D.
President of MSMA

Members of these two groups were requested by the House of Delegates and the MSMA Council in prior Sessions to investigate a mechanism for negotiation of professional fees and regulations and procedures that establish the conditions under which physicians render their services. The Ad Hoc Committee and the Commission concluded that it is not legally possible for the MSMA to be a mechanism for bargining of fees and working conditions and, therefore, recommended the establishment of a separate Guild.

(Please see next page)

House supports emergency services, RMP, Medicre

(Continued from page 1)

Following hearings at the Annual Session, the Reference Committee on Resolutions recommended to the House that the Guild was not the most desirable mechanism at this time for dealing with the socio-economic problems of medicine today. The Reference Committee felt that a more aggressive approach through the AMA is needed.

After lengthy debate, the matter was tabled.

A resolution which called for local control over PSROs was tabled for further study and the House directed the MSMA to follow developments of court suits in Oklahoma and Indiana which challenge the PSRO concept.

Three Resolutions which expressed opposition to the U.S. Supreme Court's recent decision on abortions were also tabled. Similarly, a Resolution on "Definition of Beginning of Life" was tabled.

A Constitutional Amendment concerning the methods of referendums was passed by the House and will lay on the table until the 1974 Annual Session. The Amendment reads: "Petition signed by 10 percent of the active members of the Association, including petitioners representing at least one-half of the component medical societies, will initiate a referendum regarding changes in the Constitution or By-Laws, or questions before the House of Delegates. A two-thirds vote of all active members of the Association responding will determine the question."

The House also adopted two Council recommendations. The first gave MSMA endorsement to the Health Care Foundation of Missouri in its efforts to become the responsible agency for PSRO activities in Missouri. The second stated that, as a general rule, the MSMA opposes the granting of a license to practice medicine to any physician who has been convicted of a felony.

The official minutes of the Annual Session will be published in the July issue of MISSOURI MEDICINE. A summary of action taken on several Resolutions included:

ADOPTED

EMERGENCY MEDICAL SERVICES — A MSMA Ad Hoc Committee will be named to work with other interested groups to prepare a detailed description of all aspects of a statewide Emergency Medical Service System. The plan should serve as a guide for a grant application for launching a system as has been done in Illinois and other states.

"MEDICREDIT LEGISLATION" — The MSMA endorses U.S. Senate Bill 444 and House Bill 2222 (Medicredit), as proposed by the AMA. AMA Trustees and Missouri Senators and Congressmen were informed of the endorsement.

INSURANCE FOR NEWBORN — Urges passage of legislation that provides for the right to health and hospital coverage from the moment of birth. Also states that any health insurance policy issued in the state shall provide such coverage whether issued to an individual or a group.

INSURANCE CLAIMS FORMS — Encourages physicians to charge insurance carriers for completion of insurance forms which are not Health Insurance Council approved. The physician shoul also feel free to charge for obtaining a duplica copy unless the form provides for a duplicate for the additional service of filing more than or insurance claim form. Asks HIC to design an implement, after approval by MSMA, a simplifie form.

MIDWIFERY — Authorizes appointment of committee to study midwifery and determine Missouri has a need for such services.

MMPAC — Authorizes the MSMA Council designate funds for use by the Missouri Medic Political Action Committee board to aid in pr motion of educational processes. None of the funds is to be used for candidate or politic party support.

REGIONAL MEDICAL PROGRAMS — Deplor exclusion of RMP from Administration's 19 budget and requests Congress to extend RMP le islation and funding. Missouri Congressional de gation was informed of action.

ST. LOUIS BLUE SHIELD — Opposes enactme of all legislation affecting St. Louis Blue Shie now pending in the Missouri General Assemb and instructs MSMA officers to inform Legislat of opposition. Other Blues Plans in state request not to be included in the Resolution.

NOT ADOPTED

LEGISLATED MEDICAL CARE — Would ha formed committee to study ways to deal wi trend of legislated medical care. (This is n handled by Ad Hoc Committee on Negotiation Professional Fees.)

IMMUNIZATION — Would have required rube vaccination before issuance of a marriage licen unless the female was pregnant.

REVISION OF FEDERAL NARCOTICS LAW Would have allowed legal dispensing of narcot to drug addicts in effort to eliminate necessity addits to commit crimes to maintain habit.

CONTROLLED SUBSTANCE LAW — Would sought repeal of Missouri Controlled Substan Law.

CONTINUED MEDICAL EDUCATION — Wo d have recommended that the Missouri Board f Healing Arts require 150 hours of continued me cal education every three years as prerequisite continued licensure.

ALLERGY RESIDENCY TRAINING — Wou have had MSMA not approve the residency traini program as prescribed by the AMA Council Medical Education until all fields of allergy represented.

NURSING HOME VISITS — Would have petiti Legislature to revoke present requirements monthly visitation by physician to all residents f nursing homes and simply require nursing ho e supervisors to consult with physicians as deem medically necessary.

OFFICE LIMITATION — Would have limi d MSMA Councilors and AMA Delegates from M souri to not more than three terms of two ye s each.

President-Elect James C. Cope, M.D. **Treasurer Donald Judd, M.D.**

w officers of MSMA elected to posts for 1973-74

James C. Cope, M.D., a Columbia urologist, s unanimously selected President-Elect of the ssouri State Medical Association at the Annual ssion, March 29-April 1, 1973, in St. Louis.

Dr. Cope is Past Chairman of the MSMA Council d has served as Councilor from the Fifth Dis- t since 1965. He is a former President of the one County Medical Society.

Dr. Cope succeeds E. A. Stricker, M.D., of James, who took over the reigns as President the MSMA from Walter T. Gunn, M.D., of St. uis, at the Session.

Six new MSMA officers were elected during e Convention. They are Donald Judd, M.D., St. uis, Treasurer; Robert A. Slickman, M.D., nsas City, Speaker; James T. Brown, M.D., ringfield, Vice-Speaker; Rae W. Froelich, M.D., banon, Vice-President; R. Lee Cooper, M.D., arrensburg, Vice-President; and Robert W. lley, M.D., St. Louis, Vice-President. John I. atthews, M.D., Jefferson City, was re-elected cretary.

Five Councilors were re-elected and Robert E. egant, M.D., Jefferson City, was elected to suc- d Dr. Cope as Fifth District Councilor. Those elected are Lysle M. Bach, M.D., Hannibal, cond District; Louis P. Hetlage, M.D., Troy, urth District; William D. Bradshaw, M.D., inton, Sixth District; Howard J. McAlhany, M.D., ringfield, Eighth District; and Eugene T. Hans- ough, M.D., Poplar Bluff, Tenth District.

Hector W. Benoit, Jr., M.D., Kansas City, and bert A. Ritter, M.D., St. Louis were elected legates to the AMA and Hugh E. Stephenson, ., M.D., Columbia, and Lawrence W. O'Neal, D., St. Louis, were elected as Alternates. Drs. tter and O'Neal will begin their terms Jan. 1, 74.

Completing the MSMA delegation to the AMA are Stanley S. Peterson, M.D., Springfield, and J. Loren Washburn, M.D., Versailles, Delegates; and James C. Sisk, M.D., Clayton, and Rae W. Froelich, M.D., Lebanon, Alternates.

In the organization session of the MSMA Council held immediately following the third meeting of the House of Delegates, R. Allen Chandler, M.D., Kansas City, was elected Chairman and Max S. Franklin, M.D., St. Louis, was elected Vice-Chairman.

R. Allen Chandler, M.D.
Chairman

Max S. Franklin, M.D.
Vice-Chairman

House of Delegates honors Dr. Neal, Mrs. Thomas

While there was plenty of discussion and several close votes on issues at the Annual Session, three Resolutions were passed with unanimous consent.

Dr. N. Pinson Neal, Emeritus Professor of Pathology at the University of Missouri-Columbia, due to an injured hip, was unable to attend the 115th Annual Session. It was the first Annual Session in over 50 years that Dr. Neal had not attended. A Resolution expressing wishes for a speedy recovery was adopted by acclamation.

It was also noted that Dr. Neal's son, Dr. M. Pinson Neal, Jr., had recently been named Provost of the University of Virginia Commonwealth and congratulations were included in the Resolution.

A Resolution expressing the appreciation of the Missouri State Medical Association to Mrs. Bertha A. (Bert) Thomas, who had been employed in the Association Headquarters for 30 years, was also unanimously adopted.

Mrs. Thomas retired effective April 1, 1973. The Resolution commended her for her service to the doctors of Missouri and extended the best wishes of the profession for health and happiness in the years to come.

Also passed unanimously was a Resolution urging the Postmaster General of the U.S. to issue a commemorative postage stamp honoring William Beaumont, M.D., on the 75th anniversary of the Publication of the Journal of Physiology. Dr. Beaumont is hailed as the first great American physiologist for his pioneering experiments in the physiology of digestion.

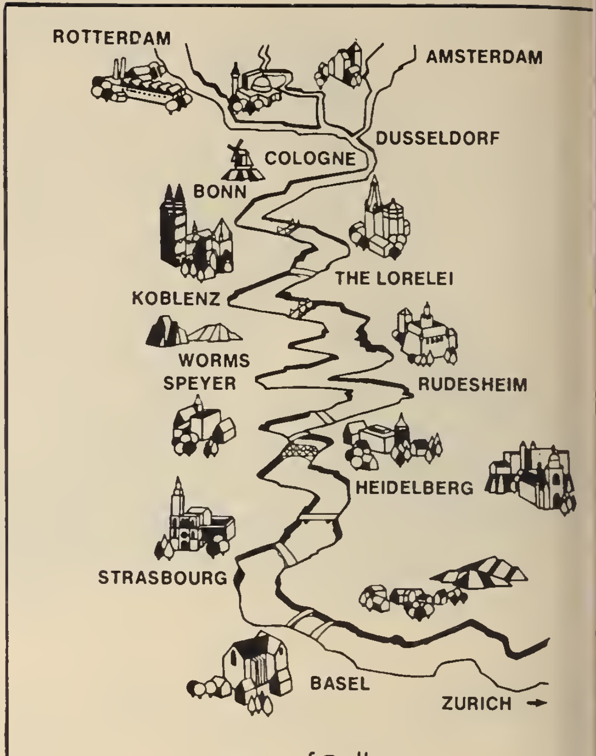
Press award winners named

Two newspaper reporters and a television station were winners in the Second Annual MSMA Medical Journalism Competition. The winners were presented plaques and checks for $150 at the Annual Session by outgoing President Walter T. Gunn, M.D.

Charles J. Oswald, reporter for the St. Louis Globe-Democrat, won the Medical News Reporting category with a series of stories on conditions at Homer G. Phillips Hospital in St. Louis.

John R. Stanard, reporter for the Poplar Bluff Daily American Republic, placed first in the Medical News Feature division with a four-part series on heart attacks.

WDAF-TV of Kansas City captured the Television News Award for an indepth report on the University of Missouri-Kansas City Medical School. Jim Pritchett was the writer and producer of the program.



Route of Fall tour

Medical seminar offered during 'Rhine Escape'

A medical seminar will be offered in conjur tion with the Missouri State Medical Associatior "Rhine Escape," scheduled this Fall.

The seminar will be conducted by the MSM in cooperation with the University of Heidelbe and the Tiefenauspital Der Stadt Bern of Bas Switzerland.

The 11-day "Rhine Escape" is highlighted a five-day cruise through Holland, Germar France and Switzerland. The tour departs Louis on October 7 and returns October 17 for inclusive cost of $569.

Trip features include:

- *Round trip air transportation via charter jet.*
- *One night at Amsterdam Hilton; five nigl aboard luxurious KD Rhine Steamer; thr nights at new Zurich Hotel.*
- *Continental breakfast while in hotels.*
- *All meals aboard ship.*
- *Complete optional sightseeing program.*

For additional information, write to Misso State Medical Association, Rhine Escape, P. Box 1028, Jefferson City, Missouri 65101.

Physicians win clock-radios

Four physicians were winners in the Regist tion Drawing at the Annual Session in St. Loui

Taking home Westinghouse AM-FM Digi Clock-Radios were Drs. Warren C. Baker, vannah; James W. Crain, Branson; Joseph Werth, Jefferson City; and George H. Wo, Carthage.

Information for Contributors

Articles are accepted for publication on condition that they are contributed solely to this journal. Material appearing in Missouri Medicine is protected by copyright. Permission will be granted on request for reproduction in reputable publications provided proper credit is given and author gives permission.

Manuscripts should be typewritten, double spaced, and the original with one carbon copy submitted. Retain another carbon copy for proofreading. Used manuscripts are not returned. School and hospital appointments of the author should accompany the manuscript. It is desirable that a synopsis-abstract of approximately 135 words accompany the manuscript. References should be arranged at the end of the article in the order in which the references are cited in the text. The reference should give name of author, title of article, name of periodical, volume number, initial page number and year. Authors are responsible for reference accuracy.

Illustrations should be glossy prints or drawings in India ink on white paper. They should not be mounted and name of author and figure number should be penciled lightly on the backs. Legends should appear on a separate sheet. Colored illustrations will be used when suitable if author assumes the actual cost.

Legal difficulties may arise from unauthorized use of names, initials or photographs in which individuals can be identified. Permission should be secured from patient or legal guardian and signed duplicate or photostat submitted with such photographs or identification. The Editor and Editorial Board assume no responsibility for the opinions and claims expressed in articles contributed by authors. If citation of an institution related to the article is made, approval of the chief of service should be given in a letter accompanying the article.

Reprint order blanks will accompany proof, which will be sent to authors prior to publication.

All material other than scientific should be received prior to the first of the month preceding month of publication.

Please give notice of change of address at least one month in advance of the change, giving old and new addresses.

Missouri State Medical Association presents for its members and their families

Rhine Escape

11 Days in the Heart of Europe Featuring a Luxurious 5 Day Cruise Through Holland, Germany, France and Switzerland.

$569 inclusive

The Great Escape! Imagine an exciting four-country cruise through Holland, Germany, France and Switzerland along the Mighty Rhine. It's individualized service all the way from your chartered jet to your deluxe hotel accommodations in Amsterdam and Zurich for a fun-filled holiday of shopping, sightseeing and nightlife.

Your Rhine cruise ship takes you through the most beautiful and romantic parts of Europe. See fairytale castles! Explore medieval towns that haven't changed in thousands of years! Sample the great Rhine wines from lush mountain vineyards!

You'll travel in a spacious deluxe outside cabin with private bath; enjoy cuisine from all of Europe as well as American specialties. The continental service meets the most demanding standards. There will be fresh flowers in your cabin every day and a hospitality desk throughout your stay for individual and group sightseeing arrangements.

It's an unforgettable experience!

There will be many times when you'll forget that you made this investment for sound financial reasons

A Wildlife Unlimited private shooting preserve is a new investment idea that offers more satisfaction *because its return is delivered in several different ways.* First, a Wildlife Unlimited investment affords the chance for substantial appreciation and/or preservation of capital. It offers major financial inducements, such as tax and depreciation advantages. But perhaps its most attractive feature is that it provides enormous personal satisfaction . . . a way to escape professional pressures . . . and the means for you, your family, and friends to share in outdoor activities which otherwise would not be available.

A turn-key facility— with follow-up management

Your Wildlife Unlimited operation is individually planned according to your exact specifications, and delivered to you as a ready-to-enjoy facility. Danforth Agri-Resources locates the land and arranges for purchase of livestock, equipment, and construction of required buildings. We plan it all: water and fish management, crops and cover, and the livestock activity. We also recruit the help, set up a record keeping system identifying the cash flow needs.

If you are a man with money to invest or shelter, Wildlife Unlimited is a unique venture that merits an immediate and thorough examination. Let Danforth Agri-Resources help you invest in a sector of the economy that has shown excellent growth year after year. Let us help you invest where your equity will be secure . . . as secure as the land itself. And, most important of all, where some of your biggest dividends will be those that are far too valuable to be measured in terms of money.

DUCKS AND UPLAND GAME BIRDS . . . choose the type of shooting. Birds, pens, flyway, pond, blinds, cover—everything is furnished.

A HANDSOME LODGE . . . build living and entertainment quarters according to your design . . . or from over 150 floor plan options we offer.

LIVESTOCK AND CROPS . . . working farms or ranches are stocked with your choice of animals . . . crops are planned to work perfectly with both sides of your Wildlife Unlimited operation.

Physician Manpower for Missouri: 1971

HERBERT R. DOMKE, M.D., Dr. P.H., Director

and

BARBARA HOSKINS, Systems Analyst

Missouri Division of Health

This report provides answers for four of the most frequently asked questions concerning Missouri's physicians:

1. How many doctors does Missouri have?
2. How many are in active practice?
3. Where are they located?
4. What are their specialties or type of practice?

We believe that this report contains the best available information for answering these questions for Missouri in 1971.

Does Missouri have enough doctors? This is, perhaps, the most important question, but it cannot be completely answered by the information in this report. Certainly, it is clear that there are great differences in areas within the state in the number of physicians available. There is no doctor, for example, in De Kalb County, which lies just northeast of St. Joseph. On the other hand, nearly half of the approximately 5,000 practicing physicians in Missouri are in the four counties and one city in the Missouri portion of the St. Louis metropolitan region. There are more than 12 physicians for every 10,000 population in the St. Louis area, but there are approximately only four physicians for each 10,000 persons living in the seven counties making up the South Central Ozark region of Missouri.

Newspaper and magazine articles, public officials and private citizens speak of the "crisis" in health care and frequently refer to a "doctor shortage." Among the many federal programs designed to improve the American health care system is the new (1972) program to provide funds for schools of medicine and osteopathy to increase the number of students. Under another program, financial incentives are provided for physicians and some other health personnel to encourage them to practice in shortage areas. Yet another new program, the National Health Service Corps, places physicians and other health personnel in areas of need. Many other federal programs attempt to provide health service where they either do not exist or are inadequate.

In the discussions about health programs however, while most people say there is an absolute shortage and claim that 50,000 additiona physicians are needed nationwide to meet immediate needs, others disagree and maintai that the problem is one of maldistribution Some contend that even if 50,000 physician could be added immediately, there still woul be the same shortages in the inner cities an rural areas.

Another important aspect of the problem i that of specialty practice; neurosurgeons an general practitioners are not interchangeabl Some are questioning whether or not the distribution of physicians within specialties is optimal; one recent editorial in the *Journal of th American Medical Association* suggests that residency programs are training too many genera surgeons.[1] It is pertinent to note also that th American Medical Association reports that as o September, 1970, the percentage of filled hospital residency programs ranged from a low o 48% for family practice to a high of 98% fo ophthalmology.[2]

There is no agreement in the United States today as to what optimum distribution by specialty is just as there is no agreement on how man doctors are needed to provide "adequate" care Also, of course, the number of physicians i only one aspect of health care availability. Factors of transportation, educational and economic backgrounds of the population to be serve affect both the demand for and use of healt personnel.

Certainly, the above questions are applicabl to Missouri. This report provides statistical information which relates to these general questions, but it cannot finally answer them. W know, however, that this report does provide detailed information of a kind currently neede by many agencies and interested individuals. Fo ample, the Division of Health has been asked identify counties which have a "shortage" of hysicians for the Health Professions Student oan Program administered by the National Initutes of Health. The legislation establishing at program provides that a county has a shortge of physicians if its ratio of physicians to opulation is less than 1:1,500. The State Comrehensive Health Planning agency has been ked by the Health Service and Mental Health dministration to identify "health service scarty areas" for use in several programs. Alough arbitrary ratios are not to be used in the lentification process, the agency is requested to dicate the number and type of health reources in the area. Thus, even within the fedal government, there is no single guideline for hat constitutes a "shortage" or "scarcity" of ealth resources.

The State Board of Health and the Goveror's Advisory Council for Comprehensive ealth Planning recognized these needs for reable information and gave priority to this tudy of physicians as the first project of the issouri Center for Health Statistics. Thus, this roject is the first new major data collection and nalysis effort of the Center. The Missouri Ciner for Health Statistics was established to proide improved health statistics to meet the rapidy increasing demands for accurate statistical ata by governmental and voluntary health gencies, professional associations and the comnunity comprehensive health agencies now beng developed in most areas of the state.

The Center is jointly sponsored by the State oard of Health and the Governor's Advisory ouncil for Comprehensive Health Planning. The origin, early development and general polcies of the Center are described in "Missouri enter for Health Statistics: The First Year, 1970-1971." This document is available on request from the Missouri Division of Health, Broadway State Office Building, Jefferson City, Mo. 65101.

Future questionnaires and reports are planned. We will appreciate comments and criticism concerning this report and the data contained in it. We especially would like to know what kind of data would be most helpful to others.

MISSOURI PHYSICIANS: THE BACKGROUND

The data for this study are derived from the State Board of Registration for the Healing Arts. There were nearly 14,000 physicians registered to practice in Missouri in July, 1971, as shown in Table 1. This does not mean that Missouri has 14,000 doctors, because many physicians maintain licensure in Missouri but do not practice in Missouri. (Both licensure and annual registration are required for a physician to practice medicine legally in Missouri. The terms are used interchangeably in this report to refer to physicians who meet both conditions.)

This study represents the first new major data collection and analysis effort of the Missouri Center for Health Statistics, which is jointly sponsored by the State Board of Health and the Governor's Advisory Council for Comprehensive Health Planning.

The content and conclusions of this report have been reviewed and approved by the Physician Manpower Committee of the Missouri Center for Health Statistics Task Force. The members of the Physician Manpower Committee are the following:

Edward W. Hassinger, Ph.D.
Raymond R. McIntyre
Edward Borman, Jr.
John A. Hailey
Edward Cross, M.D.
George E. Gantner, Jr., M.D.
H. Denny Donnell, Jr., M.D.
Willis W. Marshall, Jr.

O. F. Anderhalter, Ph.D., was Chairman of the Physician Manpower Committee, but press of other business required his resignation from the Committee. Special thanks are due him for his contribution in the formative stages of development of the Physician Manpower Study reported here. The authors also wish to express special appreciation to Willis W. Marshall, Jr., who directed the assembly of data for this study.

Reprints of this report may be obtained from the Missouri Division of Health, Broadway State Office Bldg., Jefferson City, Mo. 65101.

In July of 1971, 7,553 or well over half of the 13,987 physicians licensed by the State Board of Registration for the Healing Arts were located in other states. Of the 6,434 licensed physicians residing or practicing in Missouri, 721 were still in training. (There are additional numbers of physicians in training who either are not licensed or who function with temporary licenses.) Also licensed were 471 physicians who reported that they are retired or partially

TABLE 1

NUMBER OF PHYSICIANS REGISTERED TO PRACTICE IN MISSOURI—JULY, 1971

All Physicians (M.D. and D.O.)

Location	*Active*	*In Training*	*Retired*	*Total*
Missouri	5,242	721	471	6,434
Non-Missouri	6,348	956	249	7,553
Total Registered	11,590	1,677	720	13,987

retired. And, of course, many retired physicians have discontinued the annual registration process and have allowed their licenses to lapse. After these exclusions, there were 5,242 licensed physicians *in active practice;* a rate of 11.0 practicing physicians for each 10,000 population.

As mentioned above, many physicians in training hold only temporary licenses. According to the Missouri licensing laws, a physician may be issued a temporary license, but he then can practice only in "state maintained hospitals or other hospitals approved by the Board [of Registration for the Healing Arts] under the supervision of the superintendent or chief-of-staff of such institution."[3] Interpretation of the law has held that these physicians are not licensed practitioners in Missouri.

This report focuses on fully licensed physicians in active practice, and it excludes certain physician groups included in national physician manpower reports. Both the American Medical Association and the American Osteopathic Association include physicians in training and retired physicians, whether or not they are currently licensed to practice medicine. State and local community physician services are more accurately seen when fully licensed physicians in active practice are considered, but it is a disadvantage that a direct comparison with other reports cannot be made.

Two fairly recent Missouri physician manpower studies are those by Hassinger and Hobbs,[4] published in 1967, and Olson,[5] published in 1968. Both are based on American Medical Association and American Osteopathic Association data. These reports have shown Missouri's ratio of physicians to population to be slightly higher than that for the United States as a whole.

Hassinger and Hobbs used the 1965 American Medical Association directory and the 1966 American Osteopathic Association directory for their study of Missouri physicians. They reported 12.0 M.D.'s per 10,000 population for Missouri. This was nearly 10% below the 13.2 rate for the United States. In their study, they also noted that "the osteopath/population ratio is higher in Missouri than in any other state." The rate for all physicians in Missouri (M.D. and D.O. combined) was found to be 14.5 per 10,000 population. They noted in their report that this was the highest rate for physicians in the 12-state North Central region.

Olson found a similar relationship between the Missouri and United States rates. His information on medical doctors was from computer tapes maintained by the American Medical Association and current to December, 1966. The 1967 American Osteopathic Association directory was used for compiling information on osteopathic physicians. He found a total rate of 14.9 physicians per 10,000 population for Missouri compared to 14.5 for the United States.

The exclusion from this report of almost 1,200 licensed physicians who are in training or retired and the exclusion of the unknown number who have let their licenses lapse or hold temporary licenses obviously means that a lower ratio of physicians to population will be found in this report compared to reports based on American Medical Association and American Osteopathic Association sources which do not exclude them. The report by Hassinger and Hobbs shows a Missouri rate of 14.5 physicians per 10,000 population and Olson's report shows 14.9 compared to the 11.0 reported here. Does this mean that Missouri's physician situation has worsened? We believe not. Best evidence indicates that ratios of physicians to population are relatively stable and that changes occur slowly.

It also should be noted that United States citizenship was required for Missouri licensure until 1970. In that year, the State Attorney General ruled the citizenship requirement unconstitutional. According to the State Board of Registration for the Healing Arts, Missouri has since licensed 502 graduates of foreign medica schools. Although it has been estimated by the State Board that at least half of the foreign physicians obtaining Missouri licenses have no remained in the state to practice, the legal deterrent to a foreign physician establishing a medical practice in Missouri has been removed.

In the judgment of the authors and the Physician Manpower Committee, it seems safe to assume that (1) Missouri's rate of practicing physicians to population has not changed significantly since these previous studies and (2) that

As a general conclusion, Missouri's ratio of physicians to population is approximately the same as that for the United States.

DISTRIBUTION OF PHYSICIANS WITHIN MISSOURI

All studies of physician manpower distribution in the United States have agreed that physician services are less available in rural areas and urban ghettos. The past several decades also have seen an increase in the number of physicians on faculties of medical and osteopathic schools. These findings from other studies indicate that the number of physicians in relation to population in Missouri would be expected to be higher in urban areas than in rural, and it also would be expected that areas with training centers would have more physicians per population than comparable urban or rural areas without medical or osteopathic schools.

Table 2 shows the total number of registered physicians for counties grouped by Regional Planning Commission Areas (Fig. 1). The geographical distribution of physicians in this report focuses on these areas. Counties have been assigned into Regional Planning Commission areas by the Governor in accord with state legislation and federal guidelines. For purposes of this report, the regional groupings show the important relationships regarding physician distribution in a generally uniform and consistent pattern. As well, they have the practical advantage of permitting comparison between 20 regions rather than 114 counties.

For this study, the primary office address of the physician was used. In a number of cases, of course, the physician may reside in one county and have his office in another county. In very few instances would this affect the location of the physician in terms of the region. No changes of consequence in the ratio of physicians to population would be effected by assignment of physicians to county of residence rather than to office address.

Urban and Teaching Centers

Of Missouri's 5,242 active physicians, 3,489 are located in the two major metropolitan portions of the state. The Missouri portion of the St. Louis metropolitan region, consisting of St. Louis, St. Charles, Jefferson and Franklin counties and the independent city of St. Louis, contains 2,345 physicians or 44.7% of all Missouri practicing physicians. On the western side of the state, the Missouri portion of the Kansas City metropolitan region contains 1,144 physicians (21.8% of actively practicing physicians). This region consists of Jackson, Clay, Platte, Ray and Cass counties.

The nine counties and one independent city of these Kansas City and St. Louis regions contain 57.9% of the state's population (and only 7.9% of its land area), yet they account for 66.6% of Missouri's physicians. The Lakes Country, Mid-Missouri and Mo-Kan Bi-State regions contain an additional 13.4% of Missouri's population and have 801 physicians or 15.3%. The regions of the state which include the Census Bureau-designated Standard Metropolitan Statistical Areas, therefore, have 81.8% of Missouri physicians for 71.3% of the state's population—a larger share of physicians in comparison to their population than do the nonmetropolitan regions. The figures for all regions are shown in Table 3.

The meaning in terms of availability of physicians to population between metropolitan and nonmetropolitan Missouri is more apparent when rates of physicians per 10,000 population are considered. The metropolitan rate is 12.7 physicians for each 10,000 population, but the more rural areas of the state have only 7.0. This means that residents of the metropolitan regions have more than one and one half times the number of physicians available to them in the same region in relationship to their population than do residents of nonmetropolitan regions.

The general pattern of metropolitan rates being higher than nonmetropolitan rates has two exceptions. The major exception is nonmetropolitan Northeast Missouri with the highest regional rate in the state (18.6). This high rate is due to the presence of Kirksville College of Osteopathic Medicine with a substantial number of faculty in the Northeast Missouri region. The other exception is the Ozark Gateway region. This region includes the large city of Joplin and has a rate of 9.5. This is similar to the other urban areas and is slightly in excess of the 9.2 rate for the Mo-Kan Bi-State (St. Joseph) region. With these two exceptions, metropolitan regions have substantially higher rates of physicians per population than do nonmetropolitan regions.

Rural Regions

The 13 remaining Regional Planning Commission areas are more rural and all have lower physician rates per population than any of the seven regions discussed above.

Patterns of physician distribution in these more rural regions show considerable differ-

ences. The two rural regions with the highest physician rate per 10,000 population are in the southeast portion of the state, and the rate in these two regions is almost double that of the two areas with the fewest physicians per population that are in the Central Ozark plateau in the center of the southern portion of the state. But comparing the 13 rural regions, the pattern of distribution of physicians is not as clear as for urban and teaching centers. The northwest corner of the state has 4.6 physicians per 10,000 population (very nearly like that in the Ozark plateau), but the Green Hills region adjoining Northwest has 6.2 and the Missouri Valley region has 7.2. The other rural regions on the western side of the state, Kaysinger Basin and Show-Me, have 6.7 and 7.3 physicians per 10,000 population and, thus, are intermediate. Hassinger and Hobbs also have noted that the rural areas have fewer physicians (and fewer dentists and general hospital beds as well). Olson, too, found the lowest ratio of physicians to population in the Central Ozarks region in his study, although it was a somewhat different group of counties.

Clearly, there are fewer physicians practicing in rural areas in Missouri than in urbanized regions. In fact, only one county of the more than 70 counties in the remaining rural regions has a rate above that for the average of the metropolitan regions. Butler County in the Ozark Foothills region has 12.8 physicians per 10,000 population, but contains the city of Poplar Bluff as an urban center and is the location of three private hospitals and one veterans' hospital.

Counties

The data reported above, as has been noted, are on the basis of the Regional Planning Commission areas as assigned by the Governor. Referring again to Table 2, variation in the number of physicians per 10,000 population is even more pronounced when individual counties within the same region are considered. In those regions containing metropolitan areas, for example, St. Louis City has a rate of 19.5 physicians per 10,000 population and St. Louis County has 10.5. Significantly different are the rates for Jefferson (3.2), St. Charles (5.6) and Franklin (4.4) counties in that same region. Obviously, even within the St. Louis metropolitan area, one sees the same tendency for physicians to concentrate in the heavily urbanized portions. In fact, there is a tendency for those counties with the lowest ratio of physicians to popula-

Fig. 1 REGIONAL PLANNING COMMISSION AREAS. The Regional Planning Commission areas, to the maximum extent possible, are based on similar functions, shopping and commercial patterns and similar geographic features. Most regions have an urban center with major business concentrations. More important for this study, as also shown in the report by Hassinger and Hobbs, the urban center of the region also usually includes the major medical facilities of the region.

In Missouri, the establishment of the 20 Regional Planning Commission areas began in 1966 and continued through 1969, when the present boundaries were fixed. Each of Missouri's 114 counties and the independent city of St. Louis were assigned as noted to one of the 20 regions. Most regions contain five or more counties, but some have as few as three (Missouri Valley, Show-Me and Boonslick), and one has as many as ten (Lakes Country). For the two largest metropolitan areas, St. Louis (East-West Gateway Coordinating Council) and Kansas City (Mid-America Regional Council), the Regional Council), the Regional Planning Commission boundaries are identical with the Missouri portion of the corresponding Standard Metropolitan Statistical Areas defined by the Census Bureau with the exception of Ray County in the Kansas City region. Three other Missouri regions contain metropolitan areas, as defined by the Bureau of the Census. The Lakes Country (Springfield), Mid-Missouri (Columbia), and Mo-Kan Bi-State (St. Joseph) regions are called "metropolitan" for this report, even though they contain rural counties as well as the densely urbanized counties.

tion to adjoin the large urban concentrations. In the Kansas City region, Jackson County's rate of 15.0 is five times the 3.0 rate for adjacent Platte County. In Mid-Missouri, the same pattern is evident, but with a slight difference. The Boone County (Columbia) rate is 28.5. Two contiguous counties have the next highest rates. They are Cole (15.1), which contains Jefferson City (the state capital), and Callaway (11.4), which contains two colleges and a large state mental hospital. Osage County, which is adjacent to Cole and Callaway counties, has the lowest rate of the eight counties in the Mid-Missouri region (3.6). As a final example, De Kalb County has no physicians and adjoins Buchanan County (St. Joseph), which has a rate of 10.8 per 10,000.

Variations in regions predominately rural tend to be less marked than between counties in the metropolitan regions. Of the nine counties in the Green Hills area, Livingston County with 7.8 has the highest rate per 10,000 population and Sullivan County with the lowest rate is half with 4.0. Kaysinger Basin, another predominately rural area, contains Vernon County with 8.9 as the highest and Benton County with 4.1 as the lowest.

Although there is variation among counties of the same region, rates within regions tend to follow the same pattern. The South Central Ozark region has the lowest rate of physicians to population of all regions in Missouri. Within that region, Wright County has the highest rate of 5.1 physicians per 10,000 population. Although the highest within the region, this is below the average of all the nonmetropolitan regions in the state. Furthermore, three counties in that region, Douglas, Oregon and Texas, have rates below 3.0 and are among the counties having the lowest rate of physicians to population in the entire state.

DISTRIBUTION OF PHYSICIANS BY SPECIALTY

The trend to physician specialization began many years ago. Today, only a minority of physicians enter general practice. Many hope that the recent development of family practice as a specialty will lead to a larger number of physicians in general or family practice. In any event, it is important in evaluating physician availability to distinguish between those physicians who deal with a broad range of illnesses as do general or family practitioners and specialists, who restrict their practice and typically see patients referred by the general or family practitioner.

The difference between the primary care physician and the specialist is basic and involves much more than whether the patient is cared for by the family practitioner or is referred to a specialist. The general public usually expresses its concern in the demand that a physician be available when needed and within a reasonable time and distance. On the other hand, health professionals, while recognizing that problem, are additionally concerned that there may not be available the specialists and the needed facilities to care for the rare or unusual or life-threatening illnesses.

This report is based upon information obtained from physicians as to the percentage of time given to general practice or specialty practice if the physician functioned in more than one capacity and in which specialties. The numbers in this section of the report, therefore, are based on percentages of time in different kinds of practice and are not a direct count of individual physicians. Board certification is not reflected in our figures. A noncertified physician who limits his practice to a particular specialty is as unavailable for primary care as one who is board certified. The importance of the distinction between general or family practitioners and specialists is clearly demonstrated, for it is seen that there are sharp differences in the distribution throughout Missouri of these different kinds of physician services.

This report has shown in its previous sections that physicians tend to be concentrated in urban areas. It is obvious that this overall tendency is much more marked for physician specialists. Indeed, it is the concentration of specialists in urban areas that results in the ratio of 12.7 physicians per 10,000 population in metropolitan regions contrasted with the 7.0 in nonmetropolitan regions.

It may surprise many to learn that if one looks only at the family or general practitioner, there are more in rural regions (4.0 per 10,000 population) than in metropolitan regions where the rate is half that number (2.3). If one includes the group in internal medicine among primary physicians, as some internists recommend,[6] the degree of difference is reduced, but a slight advantage still is found; the nonmetropolitan regions have 4.3 compared to the metropolitan regions' 4.0. The distribution of general and family practitioners, therefore, is a reversal of the pattern evidenced by physicians as a whole.

In this report, the finding that there is a higher rate of general or family practitioners in rural regions than in metropolitan areas is different than in some other reports which show the rates to be about the same. Some of the differences between this report and others may again be due to the methods of the report. As noted above, this report is based on percent of time in different kinds of practice in contrast to other studies in which a physician was counted only within one category of practice.

Metropolitan St. Louis has the lowest supply of family practitioners in the state, 1.8 per 10,000 population. Nonmetropolitan Missouri Valley, just northeast of Kansas City, has 6.2 general practitioners for each 10,000 people, which is the highest rate in Missouri. That region of Missouri which has the least physicians of any area of the state, South Central Ozark, has a rate of general or family practitioners of 3.3, which is almost double the rate of family practitioners in the St. Louis region and higher than the rate in all but one of the metropolitan regions. However, the 3.3 rate of the South Central Ozark region, although higher than most metropolitan regions, is the second lowest of the 13 rural regions. The Lake of the Ozarks region, adjoining South Central Ozark to the northwest, has the lowest rate (3.0 family practitioners per 10,000 population).

Physicians in internal medicine and its subspecialties are heavily concentrated in the metropolitan regions and in the Northeast Missouri region. The metropolitan rate is 2.4 per 10,000 population. This is six times the nonmetropolitan rate of 0.4. The St. Louis region has the highest rate with 2.6. Mid-America (Kansas City) and Mid-Missouri (Columbia) are slightly less with rates of 2.3. Lakes Country (Springfield) and Mo-Kan Bi-State (St. Joseph) have rates of 1.8 and 1.4, respectively. Here, again, it must be kept in mind that these figures represent a summation based on percentages and are not based on physicians who are board certified or otherwise categorized as specialists or family practitioners.

None of the nonmetropolitan Missouri regions, with the exception of Northeast Missouri with 2.0, have rates in excess of 1.0. The northwest portion of Missouri, consisting of the Northwest Missouri, Green Hills and Missouri Valley regions, have the lowest rates of internal medicine services in the state. No medical specialists have their primary offices in the Northwest Missouri region. Green Hills' rate is 0.1 and Missouri Valley's rate is only 0.2.

Surgery, obstetrics and pediatrics, the other "direct care" specialties (Table 4), show similar relationships between metropolitan and nonmetropolitan rates. With only three exceptions, every region contains physicians providing care in these specialties. The exceptions are Missouri Valley with no obstetrician and Green Hills and Boonslick with no psychiatrist. (In these tables, a rate of 0.0 indicates that some care is available, but the rate per 10,000 is less than 0.05.)

Table 4 summarizes the other clinical specialties, such as radiology and anesthesiology. Here the same rate differential between metropolitan and nonmetropolitan Missouri is apparent. More regions, however, appear to completely lack these services. Four regions—Missouri Valley, Boonslick, South Central Ozark and Meramec—have no radiologist based in the region. Seven regions have no anesthesiologists; another seven have no pathologists.

It must not be assumed, however, that the services of radiology or pathology specialists are not available. What this report shows is that they do not live in or have their principal offices in the region. All hospitals provide for radiology and pathology services, but these may be provided by specialists who give only a portion of their time to that hospital. In effect, some physicians "ride circuit" and provide services to many hospitals. It would be inaccurate, therefore, to assume that the service was not available, but it is probably valid to infer that the

services of these specialists are not as readily available as they would be in the regions where they are concentrated.

Table 4 permits a comparison of regions in terms of those categories of physicians directly involved with "clinical care." Physicians in nonclinical fields of medicine, such as administrators, are shown separately as are those whose specialties are unknown. Physicians in administrative positions should be excluded if one is trying to assess availability of medical services.

From this and the preceding tables, it is evident that the "doctor shortage" is not merely one of numbers. Even for those physicians in clinical care, specialties should be examined. One area may have pediatricians but no anesthesiologists; in another area, the reverse may be true.

DISTRIBUTION OF MEDICAL DOCTORS AND OSTEOPATHIC PHYSICIANS

Licensed physicians in Missouri may have received either the M.D. degree following medical school training or the D.O. degree from a school of osteopathy. Of Missouri's 5,242 physicians in active practice, 4,405 (approximately 85%) have the M.D. degree and 837 (approximately 15%) have the D.O. degree. Distribution by region is shown in Table 5.

Missouri has a high proportion of osteopathic physicians compared with the United States as a whole. As mentioned previously, exact comparison with United States figures cannot be made because of the lack of similar data. Best available national figures that permit exclusion of physicians in training, however, show 259,617 active M.D.'s and 10,606 active D.O.'s[7] for rates of 12.6 and 0.5, respectively. Missouri's rate of 1.8 osteopathic physicians per 10,000 population is nearly four times the 0.5 rate for the United States. The relatively high proportion of osteopathic physicians in Missouri is undoubtedly influenced by the presence of two schools of osteopathic medicine—one at Kirksville and the other in Kansas City.

On the other hand, Missouri has only 9.3 licensed M.D.'s in active practice per 10,000 population in comparison to the 12.6 for the United

States. After taking into account the different methods, it is reasonable to assume that the Missouri rate of M.D.'s to population is lower than that for the United States. It is evident that it is the substantial number of practicing osteopathic physicians that brings Missouri's total physician rate close to the average rate for the United States.

There are substantial differences between M.D.'s and D.O.'s in terms of both their location and the percent who are specialized. In general, physicians with the M.D. degree are more likely to be located in urban areas and be specialists. Conversely, osteopathic physicians are more likely to be located in rural areas and be engaged in general or family practice.

In the five metropolitan regions, there are 3,820 M.D.'s and 470 D.O.'s. That is, of all the physicians in metropolitan regions, almost 90% are M.D.'s and 11% are D.O.'s. In rural Missouri, however, nearly 40% of the physicians are D.O.'s. Of the 952 physicians in active practice in nonmetropolitan Missouri, 585 have the M.D. degree and 367 have the D.O. degree. This is in sharp contrast to the distribution in metropolitan regions.

Looking at specialization of physician services provided by M.D.'s, approximately only 20% are in general or family practice; that is, more than four fifths are in specialized care. In an earlier section, it was shown that physicians in metropolitan areas were more specialized than those in rural areas. This is especially true for M.D.'s. In metropolitan regions, only 13% of M.D. physicians' service is in general or family practice. The tendency for M.D.'s as a group to be highly specialized is exemplified by the fact that even in the rural areas, half of M.D. physicians' service is given in specialized care. In contrast, the majority of the care provided by D.O.'s is in general or family practice; only one third is specialized.

The comparison of osteopathic physician distribution between urban and rural Missouri is markedly influenced by the location of the two schools of osteopathic medicine. The Kirksville

School of Osteopathic Medicine is located in rural northeast Missouri. There are some osteopathic physician specialists in the other rural regions of Missouri, but the main group of osteopathic specialists in rural Missouri is concentrated in Kirksville (Northeast Missouri region), where there are more than ten D.O. specialists per 10,000 population. In the remaining 14 nonmetropolitan regions, there is less than one osteopathic specialist per 10,000 population.

The location in Kansas City of another school of osteopathy influences the higher concentration of D.O. specialists in that area as compared to St. Louis. In Kansas City, there is one osteopathic specialist per 10,000 people. The St. Louis region, which does not have an osteopathic school, has a rate only one third that of Kansas City. Detailed information regarding the rates for M.D.'s and D.O.'s is given in Tables 6 and 7.

The location of the two schools of osteopathic medicine thus tends to distort somewhat the general comparisons between urban and rural areas for osteopathic physicians, but it is apparent that doctors of osteopathy tend to locate in the more rural areas where they provide general or family practice services and, thus, contribute substantially to primary care in rural Missouri.

However, differences in the proportion of M.D./D.O. physicians also are seen between different rural areas of the state. Northeast Missouri with the Kirksville school and its surrounding regions (Green Hills, Mark Twain and Boonslick) have the highest percentages of osteopathic physicians of the total physicians in active practice in these regions. For this group of regions, almost four out of every five physicians in practice are doctors of osteopathy. In sharp contrast to the northeast rural regions are the two southeast regions of Missouri (Bootheel and Southeast Missouri), where more than four of every five physicians in active practice have an M.D. degree. In the St. Louis metropolitan region, on the other hand, almost 19 of every 20

physicians are M.D.'s and in Kansas City, four out of every five physicians are M.D.'s. Obviously, the geographic location of the schools of osteopathy have a marked influence on the location of D.O. physicians.

Conclusion

This report provides information regarding the location and type of practice of all physicians in fully licensed, active practice in Missouri. It again demonstrates the previously observed concentration of physicians in urban centers and in communities with medical or osteopathic schools. The greater ratio of physicians to population in urban and training centers is shown to be due entirely to the special concentration of physician specialists in those communities. The rural regions of Missouri have more general or family practitioners in relation to population than the urban regions. Missouri has approximately 15% of its physician population trained in osteopathic medicine. Osteopathic physicians, in contrast to M.D.'s, are more likely to be engaged in general or family practice and, also, are more likely to practice in the rural regions in Missouri.

Other studies have demonstrated that urban ghetto areas also are relatively lacking in physician services. The data of this study did not permit direct analysis of this problem.

The Doc's Paradox

By

CHRISTOPHER Y. THOMAS, JR., M.D.

President, Jackson County Medical Society

The following is a transcript of the address which Dr. Thomas delivered as the incoming President of Jackson County Medical Society at the Society's Annual President's Dinner held on Jan. 19, 1971.

FOR ABOUT ONE DECADE now, we Americans, providers and consumers alike, have heard that there is a crisis in national health care. Public and private programs have spent millions of dollars trying to define the problem and offer solutions. In spite of these efforts, it would appear that the basic death rate, which held steady for over one-half century, now appears to be worsening. Mortality rates have risen for all ages between 15 and 74, and improvement has been registered in only the very young and the very old. If a massive transfusion of billions of dollars has not materially altered the health of the American people, as measured by the death rate, how can additional dollars be expected to improve the situation?

The primary reasons for the initial decrease and the recent uptrend in mortality rates are (1) the near-conquest of diseases of infectious origin and (2) the recent upward trend in death rates from major chronic disease, including heart disease, cancer and diabetes, and from accidents and other violence. For young men ages 15 to 24, motor vehicle accidents accounted for most of the upturn; suicide and homicide came next.[1] More money provided for more people to see more doctors who are better trained has not yielded better results.

Let us try to examine the background of what would appear to be a paradox. The first essential might be to examine the present-day-physician—the man, his training, his methods. Early in life, this young man became motivated by a strong desire to help people and decided to become a physician. The road ahead was severely competitive and he knew that only one third of the premedical students would ultimately be admitted to medical school. He was well aware that his grade point average would have to be in the A– to B+ area and that doing poorly in any one of the many subjects would, in all likelihood, eliminate him from consideration.

There is little reason to question the motivation of a student who has successfully completed a premedical education with a grade point average that qualifies him for admission to medical school. It remains now only to conduct personal interviews to eliminate those who for other personal or financial reasons might not survive the rigors of medical school itself. The competitive aspect has frequently be criticized, but those who believe in it feel that competition sharpens the wit, whets the appetite and gives a greater sense of fulfillment once the objective is achieved.

Our young man now proceeds through his medical school curriculum and emerges as a health professional. I will not belabor the details of the medical school curriculum, but I will examine the end product. Whether he now chooses to serve an internship and enter general practice or whether he chooses to pursue a three-to-five year residency in a specialty, he emerges as a professional who stands as the ultimate source of technical knowledge and authority in his field. The bulk of his education has been scientific—not only from learning a massive amount of scientific facts, but also being indoctrinated in the use of the scientific method of thinking.

Much of the medical man's activity can be represented by the process of differential diagnosis, whereby a succession of diagnoses in the form of hypotheses is tested against the available signs and symptoms. Rationality is as significant an attribute of the physician now as it was in the days of Hippocrates. The rationality is particularized and technical—a method of sorting the enormous mass of concrete detail perceived as so overwhelming in medical school. Clinical rationality is not a tool for the exploration or discovery of general principles, as rationality is in science, but a tool for sorting the interconnection of perceived and hypothesized facts. "Principles" are generated in the course of clinical practice, but they are generalizations from personal and, therefore, systematically-biased experience.[2]

The physician is both scientist and practitioner. The practitioner side may have a different view of his work from the scientist; in fact, perhaps a different way of thinking about the world.

First, the aim of the practitioner is not *only* knowledge but action. Successful action is to be preferred, but even action with very little chance of success is to be preferred to no action at all. There may even be a tendency to take action for its own sake on the assumption that doing something is better than doing nothing. He acts to correct lethal shock while simultaneously attempting to determine the cause. Toxicity with fever is attacked vigorously even though the source and type or organism is yet to be discovered. Pain is relieved while its underlying cause is being studied.

Second, the practitioner must believe in what he is doing in order to practice, to believe in what he does results in good rather than harm and that what he does makes the difference between success and failure rather than no difference at all. He will tend to believe that practical action is preferred to skeptical detachment—the old quote of "don't just stand there, do something."

Third, being a pragmatist, the practitioner is prone to rely upon apparent "results" for his guide rather than on theory, and he is prone to "tinker" if he does not seem to be getting results by conventional means.

Fourth, the clinician is prone to trust his *own* accumulation of personal, firsthand experience more than abstract principles or "book knowledge" of the classroom variety.

Finally, the practitioner is more likely to emphasize the idea of relativity and probability than the idea of regularity and lawful behavior. This is part of the art of medicine, since disease seldom follows precise and absolute patterns.

In his commitment to action, his faith, his pragmatism, his subjectivism and his emphasis on relativity, the practitioner side is quite different from the scientist side. In emergencies, the practitioner cannot wait for all of the evidence. In any point of historical time, he cannot wait for the scientific discoveries of the future. Dealing with individual cases, he cannot rely entirely on general concepts or principles; he must also rely on his own senses.

In assuming responsibility for the practical action he takes, he also assumes a degree of vulnerability, for while he may gain the gratitude due the miracle worker, he also may gain the reproach due the man who fails to work expected miracles. Professional authority, like political or economic power, teeters between glory and ruin and claims its glory because of its risk of ruin.[3]

The nature of the work of this professional practitioner is the attempted solution of concrete problems of individual patients. He is characteristically oriented to applying science rather than creating or contributing to it. Medical practice is oriented toward intervention, irrespective of the existence of adequate and reliable knowledge. He must predict with the facts at hand what the anticipated flow of disease will be and proceed in an attempt to interrupt it. The characteristics of a physician's training tend to encourage emphasis on personal rather than communal responsibility. This tends to support individual, but not collective, efforts at regulation and places emphasis on the primacy of firsthand clinical experience rather than scientific laws or general rules.

While he must act to protect his own individual patients from harm, the practitioner's emphasis on variability and probability makes him despair at the thought of trying to protect all of society.

With this background view of the practitioner, we must view the consequences of thrusting him into the whirlwind of recent social changes. Here, now, is a man who has been given the tools for scientific problem-solving and whose profession has indoctrinated him in the values of competence, dedication to his work and professional integrity. He now has thrust upon him a new phrase, "comprehensive medical care," which speaks of a continuous spectrum of needs and services from health education to long term care of the incurable. A man who has been trained in the treatment of the acute illness and whose expertise includes radiation, antitumor drugs, heart-lung machines, mechanical respirators, elaborate diagnostic tests and techniques, incubators and a multitude of mon-

SYNTHROID
T4

T_4 IS THE PREDICTABLE HORMONE BECAUSE IT LOVES PROTEIN.

SYNTHROID® (sodium levothyroxine) is pure synthetic T_4, the major circulating thyroid hormone. It is reliable to use because of its affinity for protein-binding sites in the blood. T_3 is more fickle. Sometimes it binds. Sometimes it doesn't. T_4 more *predictably* binds to protein.

RADAR
AHEAD

ALL THYROID-FUNCTION TESTS ARE USEFUL IN MONITORING SYNTHROID THERAPY

No calculations are needed, test interpretation is simple.

Any of the commonly used T_4 thyroid function tests (P.B.I., T_4 By Column, Murphy-Pattee, Free Thyroxine) are useful in monitoring patients on T_4 because they *all* measure T_4. Patients on SYNTHROID are thereby easy to monitor because their results will fall within predictable, elevated test ranges. Of course, clinical assessment is the best criterion of the thyroid status of the drug-treated patient.

TEST	HYPOTHYROID	SYNTHROID THERAPEUTIC NORMAL
P.B.I.	Less than 4 mcg %	6-10 mcg %
T_4 By Column	Less than 3 mcg %	7-9 mcg %
T_3 (Resin)	Less than 25%	27-35%
T_3 (Red Cell)	Less than 11%	11.5-18%
Free Thyroxine	Less than 0.7 nanograms %	0.7-2.5 nanograms %
Murphy-Pattee	Less than 2.9 mcg %	4-11 mcg %

HISTORICAL
MARKER

TWO GOOD REASONS WHY THE ROAD TO NORMALIZED THYROID STATUS IS SO SMOOTH FOR THE SYNTHROID PATIENT.

(1) The onset of action of T_4 is gradual. It has a long in vivo "half-life" of over six days. (Occasional missed doses or accidental double-doses are of les concern because of this factor)[1]; (2) since SYNTHROID contains on T_4, the potential for metabolic surges traceable to more potent iodides (T_3) is eliminated.

AS WITH ANY THYROID PREPARATION, CAUTIOUS OBSERVATION OF THE PATIENT DURING THE BEGINNING OF THERAPY WILL ALER THE PHYSICIAN TO ANY UNTOWARD EFFECTS.

Side effects, when they do occur are related to excessive dosage. Caution should be exercised in administering the drug to patient with cardiovascular disease. Rea the accompanying prescribing information for additional data o write Flint Laboratories.

WHY DOES SYNTHROID COST LESS THAN SYNTHETIC DRUGS CONTAINING T_3?

Very simple. T_3 costs more to make synthetically than does T_4. So it is economically necessary for a synthetic thyroid medication containing T_3 to cost more than one containing T_4 alone. Synthetic combinations cost patients nearly 50% more than SYNTHROID[3] because the T_3 costs more to start with; also there is the additional expense of formulating a tablet containing two active ingredients.

Address ____________________

City ________ State ________ Zip ________

Indications: SYNTHROID (sodium levothyroxine) is specific replacement therapy for diminished or absent thyroid function resulting from primary or secondary atrophy of the gland, congenital defect, surgery, excessive radiation, or antithyroid drugs. Indications for SYNTHROID (sodium levothyroxine) **Tablets** include myxedema, hypothyroidism without myxedema, hypothyroidism in pregnancy, pediatric and geriatric hypothyroidism, hypopituitary hypothyroidism, simple (nontoxic) goiter, and reproductive disorders associated with hypothyroidism. SYNTHROID (sodium levothyroxine) **for Injection** is indicated for intravenous use in myxedematous coma and other thyroid dysfunctions where rapid replacement of the hormone is required. The injection is also indicated for intramuscular use in cases where the oral route is suspect or contraindicated due to existing conditions or to absorption defects, and when a rapid onset of effect is not desired.

Precautions: As with other thyroid preparations, an overdosage may cause diarrhea or cramps, nervousness, tremors, tachycardia, vomiting and continued weight loss. These effects may begin after four or five days or may not become apparent for one to three weeks. Patients receiving the drug should be observed closely for signs of thyrotoxicosis. If indications of overdosage appear, discontinue medication for 2-6 days, then resume at a lower dosage level. In patients with diabetes mellitus, careful observations should be made for changes in insulin or other antidiabetic drug dosage requirements. If hypothyroidism is accompanied by adrenal insufficiency, as Addison's Disease (chronic subcortical insufficiency), Simmonds's Disease (panhypopituitarism) or Cushing's syndrome (hyperadrenalism), these dysfunctions must be corrected prior to and during SYNTHROID (sodium levothyroxine) administration. The drug should be administered with caution to patients with cardiovascular disease; development of chest pains or other aggravations of cardiovascular disease requires a reduction in dosage.

Contraindications: Thyrotoxicosis, acute myocardial infarction. **Side effects:** The effects of SYNTHROID (sodium levothyroxine) therapy are slow in being manifested. Side effects, when they do occur, are secondary to increased rates of body metabolism; sweating, heart palpitations with or without pain, leg cramps, and weight loss. Diarrhea, vomiting, and nervousness have also been observed. Myxedematous patients with heart disease have died from abrupt increases in dosage of thyroid drugs. Careful observation of the patient during the beginning of any thyroid therapy will alert the physician to any untoward effects.

In most cases with side effects, a reduction of dosage followed by a more gradual adjustment upward will result in a more accurate indication of the patient's dosage requirements without the appearance of side effects.

Dosage and Administration: The activity of a 0.1 mg. SYNTHROID (sodium levothyroxine) TABLET is equivalent to approximately one grain thyroid, U.S.P. Administer SYNTHROID tablets as a single daily dose, preferably after breakfast. In hypothyroidism without myxedema, the usual initial adult dose is 0.1 mg. daily, and may be increased by 0.1 mg. every 30 days until proper metabolic balance is attained. Clinical evaluation should be made monthly and PBI measurements about every 90 days. Final maintenance dosage will usually range from 0.2-0.4 mg. daily. In adult myxedema, starting dose should be 0.025 mg. daily. The dose may be increased to 0.05 mg. after two weeks and to 0.1 mg. at the end of a second two weeks. The daily dose may be further increased at two-month intervals by 0.1 mg. until the optimum maintenance dose is reached (0.1-1.0 mg. daily).

Supplied: Tablets: 0.025 mg., 0.05 mg., 0.1 mg., 0.15 mg., 0.2 mg., 0.3 mg., 0.5 mg., scored and color-coded, in bottles of 100, 500, and 1000. Injection: 500 mcg. lyophilized active ingredient and 10 mg. of Mannitol, N.F., in 10 ml. single-dose vial, with 5 ml. vial of Sodium Chloride Injection, U.S.P., as a diluent. SYNTHROID (sodium levothyroxine) for Injection may be administered intravenously utilizing 200-400 mcg. of a solution containing 100 mcg. per ml. If significant improvement is not shown the following day, a repeat injection of 100-200 mcg. may be given.

itoring devices is suddenly being asked to consider the social aspects of disease and death. That health, like happiness, may be dependent upon the individual's morale, sense of purpose and maintenance of a consistent life-style is something the physician is just beginning to comprehend. It is a shattering experience.

Physicians, no less than lawyers and ministers, are prone to believe that their work experience equips them uniquely to understand life and human nature. He may well display this attitude when asked to participate on consumer-dominated health planning boards. The laymen on these boards respectfully receive the physician's opinion as fact, but the laymen cannot discriminate between those that are based on training, skill and experience and those that are not. After a few chases up blind alleys and following a general lack of progress, it suddenly dawns upon the entire group that no one has the necessary expertise and experience to define the problem. No one can ask the proper questions. No one man knows the answers. This may result in anger and frustration. The laymen tend to blame the physician while the physician considers it a waste of time. Why is it that the leaders of a community, laymen and physicians alike, seem to make little progress in health planning?

While many of the discoveries in medicine *permit* a social change, the average physician has never considered himself to be an active part of the change. He has been concerned with the prevention and therapy of the *consequences* of social change such as the relationship between diet and heart disease and the relationship between smoking and lung cancer. The physician has felt that an *active* role in trying to mold social change is distracting and destructive to his basic purpose.

While our whole social system must recognize the need for adaptation, private medicine should react to create a new man for the new times. The need might best be met by a new specialty—the specialty of community medicine.[4] In addition to the present medical school curriculum now offered, this man should have training in epidemiology, statistics, management, administration and medical sociology. He would be a scientist and a social worker ready to cooperate in team work with the people, a friend and leader directing all of his efforts toward prevention and becoming a therapist when prevention breaks down. His job would be identifying health needs, evaluating performance, advising the community of health needs and services and knitting together the multiple professional disciplines for effective performance.

He could be the head of a new health board comprised of a local health council, a local multidiscipline professional consultative committee and a medical school liaison committee. Perhaps only in this way can coordination of medical knowledge lead to effective and efficient application.

The specialist in community medicine would direct important educational programs aimed at the long-neglected, all-important enemy of health—consumer life-style. Society itself must be educated as to its own role in health maintenance. The health board should educate those who already have concern for their own health and, especially, the young before they have acquired any life-long, health-threatening habits.[5]

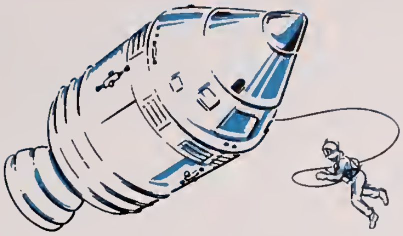
This is not *reform*, but adaptation to social change by our present system. Freedom is the recognition of necessity. Recognition and definition of present day health necessities would allow all of us the freedom to pursue other goals. I believe that private medicine can act responsibly in this regard. Much thought should be given to finding the best method, and I have suggested the above as one possibility.

Yet, there are those who are bent upon reform of the entire system. Both the action of maintaining the status quo or the reaction of reform movement can produce evils. Or to put it another way, there is no guarantee in reform.

If in recognizing the need for adaptation or change we are made to feel guilty by those who are preaching reform, then we are trapped. We have bitten on a hidden hook. This is the "double-bind," as described by Bateson. The "double-bind" is an overt or social message with a covert or hidden meaning. Examples are (1) If you *don't* do what we ask, we will openly condemn you as irresponsible (If you *do* act as we suggest, we will secretly condemn you as a simpleton.); (2) If you *don't* set up peer review organizations, we will suspect that you are hiding something (If you *do* set up peer review organizations, it will confirm our suspicions.).[6] This method of conjuring up a guilty conscience can be used by skillful politicians and ambitious leaders to extend their control—often beyond legal limits. The problem lies only in not recognizing it.

I have tried to sketch in the background of what would appear to be, in the eyes of most laymen, a professional paradox. A paradox that becomes intelligible not as a deep conspiracy

(*Continued on page 294*)



Man in space, now fait accompli, re-emphasizes the importance of Uro-Phosphate therapy. Research into the effect of space travel on the astronaut reveals that weightlessness causes loss of bone calcium. As the bones are required to bear less and less of the weight of the body they lose calcium, increasing the calcium content of the urine. When physical activity is reduced, the acidity of the urine should be adjusted to keep increased calcium in solution . . . . a prophylaxis to prevent kidney or bladder calculi.

Uro-Phosphate®

NOW A SUGAR-COATED TABLET

Each tablet contains: METHENAMINE, 300 mg.; SODIUM ACID PHOSPHATE, 500 mg.

Uro-Phosphate gives comfort and protection when inactivity causes discomfort in the urinary function. It keeps calcium in solution, preventing calculi; it maintains clear, acid, sterile urine; it encourages complete voiding and lessens frequency when residual urine is present.

Uro-Phosphate contains sodium acid phosphate, a natural urinary acidifier. This component is fortified with methenamine which is inert until it reaches the acid urinary bladder. In this environment it releases a mild antiseptic keeping the urine sterile.

Uro-Phosphate is safe for continuous use. There are no contra-indications other than acidosis. It can be given in sufficient amount to keep the urine clear, acid and sterile. A heavy sugar coating protects its potency.

Dosage:

For protection of the inactive patient 1 or 2 tablets every 4 to 6 hours is usually sufficient to keep the urine clear, acid and sterile.

2 tablets on retiring will keep residual urine acid and sterile, contributing to comfort and rest.

A clinical supply will be sent to physicians and hospitals on request.

optional therapy

THE mudranes®

All Mudranes are bronchodilator-mucolytic in action, and are indicated for symptomatic relief of bronchial asthma, emphysema, bronchiectasis and chronic bronchitis. **MUDRANE tablets** contain 195 mg. potassium iodide; 130 mg. aminophylline; 21 mg. phenobarbital (Warning: may be habit-forming); 16 mg. ephedrine HCl. **Dosage** is one tablet with full glass of water, 3 or 4 times a day. **Precautions** are those for aminophylline-phenobarbital-ephedrine combinations. **Iodide side-effects:** May cause nausea. Very long use may cause goiter. Discontinue if symptoms of iodism develop. **Iodide contraindications:** Tuberculosis; pregnancy (to protect the fetus against possible depression of thyroid activity). **MUDRANE-2 tablets** contain 195 mg. potassium iodide; 130 mg. aminophylline. **Dosage** is one tablet with full glass of water, 3 or 4 times a day. **Precautions** are those for aminophylline. **Iodide side-effects and contraindications are listed above. MUDRANE GG tablets** contain 100 mg. glyceryl guaiacolate; 130 mg. aminophylline; 21 mg. phenobarbital (Warning: may be habit-forming); 16 mg. ephedrine HCl. **Dosage** is one tablet with full glass of water, 3 or 4 times a day. **Precautions** are those for aminophylline-phenobarbital-ephedrine combinations. **MUDRANE GG-2 tablets** contain 100 mg. glyceryl guaiacolate; 130 mg. aminophylline. **Dosage** is one tablet with full glass of water, 3 or 4 times a day. **Precautions:** Those for aminophylline. **MUDRANE GG Elixir.** Each teaspoonful (5 cc) contains 26 mg. glyceryl guaiacolate; 20 mg. theophylline; 5.4 mg. phenobarbital (Warning: may be habit-forming); 4 mg. ephedrine HCl. **Dosage:** Children, 1 cc for each 10 lbs. of body weight; one teaspoonful (5 cc) for a 50 lb. child. Dose may be repeated 3 or 4 times a day. Adult, one tablespoonful, 4 times daily. All doses should be followed with ½ to full glass of water. **Precautions:** See those listed above for Mudrane GG tablets.

MUDRANE—original formula
First choice

MUDRANE-2
When ephedrine is too exciting
or is contraindicated

MUDRANE GG
During pregnancy or when K.I. is
contraindicated or not tolerated

WASHINGTON

The Administration has notified the American Medical Association that it is "prepared to review thoroughly the regulations governing the medical profession" in the Phase 3 controls that continue the limits on physicians' fee increases.

The Administration's letter avoided a direct reply to the AMA's petition of January 15 to President Nixon urging that physicians be exempted from the Phase 3 controls as has been most of the rest of the economy.

John Dunlop, director of the Cost of Living Council, said the President had asked him to respond to the AMA letter. Dunlop said, "Having assumed responsibility for the economic stabilization program last month, I am now prepared to review thoroughly the regulations governing the medical profession."

"As you know," wrote Dunlop to John R. Kernodle, M.D., Chairman of the AMA Board of Trustees, "the health field has been persistently among the most inflationary areas in our economy, and I am sure it is our goal to alter that trend."

The AMA had told the President that physicians' fees rose only 1.7% during the first 12 months of Phase 2. ". . . we have surpassed the original expectations," said Dr. Kernodle in the AMA letter to the President. "In view of our demonstrated success during the past year, you can imagine our dismay . . . that the medical profession has once again been singled out under special controls."

Dunlop's letter did not mention the AMA's request for a meeting with President Nixon and his top economic advisers to discuss the issue.

In his letter to Dr. Kernodle, Dunlop said: "We are presently in the process of appointing members to the new Health Industry Advisory Committee and I assure you that the views of physicians will be represented on that committee. As soon as an executive director for the committee is named, I will have him contact you for suggestions on how best to meet our goals for controlling health care costs under Phase 3.

"Meanwhile, I know the federal government can count on your cooperation in following the legal requirements now in effect, and I look forward to working with you to evaluate new alternatives."

* * *

It appears likely that Congress this year will pass legislation to improve emergency medical services throughout the nation. Both the Senate and the House have opened hearings on several bills that would provide federal funds to assist local governments in improving ambulance and emergency room services.

Among the major bills addressing themselves to emergency medical care is one developed by the AMA. Sponsored by Senator J. Glenn Beall (R.-Md.) and by Representative James Hastings (R.-N. Y.), the AMA bills (S. 654 and H. R. 4952) provide for the establishment of a comprehensive emergency medical system across the nation. Direction and financial assistance would be at the federal level, however the programs would be developed at the community level.

In outlining the AMA bill before a subcommittee of the House, Roy M. Baker, M.D., Jacksonville, Fla., summed up the extent of the problem by excerpting certain statistics from a recent report published by the National Research Council.

> "Accidental injury and acute illness generate a staggering demand on ambulance and rescue services, allied health personnel, physicians, and hospitals for the delivery of emergency medical services. Accidental injury is the leading cause of death among all persons aged 1 to 38. Each year more than 52 million U. S. citizens are injured, of whom more than 110,000 die, 11 million require bed care for a day or more, and 400,000 suffer lasting disability at a cost of nearly $3 billion in medical fees and hospital expenses and over $7 billion in lost wages. Those requiring hospitalization occupy an average of 65,000 beds for 22 million bed-days under the care of 88,000 hospital personnel. This hospital load is equivalent to 130 500-bed hospitals. Of the more than 700,000 deaths from heart disease each year, the majority are due to acute myocardial infarction and more than half of these deaths occur before reaching a hospital. Ap-

proximately 40 million persons seek care each year in hospital emergency departments as a result of accidents, heart disease, stroke, poisoning, diabetic coma, convulsive disorders, and many other illnesses."

In his testimony, Dr. Baker noted as a matter of interest for the Committee, there are currently seven two-year emergency residency programs in operation. Beginning on July 1, 1973, there will be an additional seven residency programs operational. In addition, there are three institutions conducting short-course training programs in the field of emergency medicine.

* * *

The use of human subjects in medical research is essential for the benefit of society despite the fact that it will place some participants at a calculated disadvantage, the American Medical Association told Congress.

The AMA comments were made to Senator Kennedy's Senate health subcommittee in hearings on the subject of human experimentation and if a need exists for federal legislation to forestall abuses.

William R. Barclay, M.D., Assistant Vice-President of the AMA, told the senators that "The practice of medicine is both an art and a science, and we are constantly seeking new means to improve the quality and length of life. The evolution of sound medical practice through the years has reduced the incidence of pain and has done much to advance the cause of human dignity. These procedures, however, today as always, require the weighing of risk against benefit at every level of professional discretion. It is evident that there is a certain degree of risk attendant to any medical procedure.

"But if we are to continue to improve our high standards of patient care, we must maintain our initiatives in biomedical research. The accomplishments of modern medical practice testify to the merits of continued research. Such advances are hard won, but the benefits are beyond question.

"Medicine as a science must conduct experimentation if it is to progress rather than stagnate. Experimentation is an essential principle of all sciences, be they biological or physical. Scientific experiments are conducted both to test new hypotheses and to reexamine the validity of accepted hypotheses.

"A medical experiment with human subjects is sometimes referred to as a clinical trial. As such, it should be a test of a reasonable hypothesis based on sound laboratory data. It should not be a random groping for information. A well designed clinical trial has elements in its design which assure that it will be a useful and a justifiable undertaking.

". . . A human experiment, by its very nature, establishes a set of circumstances which will place some of the participants at a calculated disadvantage. Generally a trial is established to answer the question, 'Is treatment A better than treatment B?' No definitive answer to this question can be obtained until the test is conducted over an adequate period of time and sufficient data has been gathered by which to measure the relative response of the subject.

". . . Through the process of clinical investigation, which we have described here, drugs and procedures become available for widespread usage in patient care.

". . . We note that it is the Committee's hope that these hearings will encourage continued support of an advancement of biomedical research. If we are to continue to increase our knowledge and continue to improve medical care for the benefit of society, medical research using human subjects is essential," Dr. Barclay concluded.

The Doc's Paradox

(Continued from page 292D)

against the public, but as a "natural" outcome of well-intentioned, highly-trained people with a special perspective on themselves, their patients and their profession. The fact that it involves good intentions rather than a conspiracy makes it a difficult problem for social policy to cope with. We have tried to explain conversely why it is difficult for the individual physician to cope with social policy. Insofar as many of the components of our profession—the assumption of personal responsibility, integrity and self-regulation, for example—are positively valued by our society, the problem for social policy is to avoid destroying what is valuable in the course of changing what is unsatisfactory.

Notes of interest from Here .... and There

Dr. John C. Murphy, University City, has been appointed acting Commissioner of Health of St. Louis County succeeding **Dr. C. Howe Eller**, who has retired. Dr. Murphy has been assistant health commissioner since 1959. Since joining the St. Louis County Health Department in 1950, he has served as director of tuberculosis control and director of chronic disease control. He previously served with the Veterans Administration and in the chest clinic of the County Health Department while he engaged part time in private practice. He is a member of the medical staff of St. Louis University and St. Mary's Health Center.

Clarence C. Cohrs, M.D., Moberly, was elected president of the **Missouri State Allergy Association** at the organization's annual meeting in St. Louis recently. Other officers elected were **Drs. Jean Chapman**, Cape Girardeau, president-elect, and **Donald V. Youll**, Kansas City, secretary-treasurer. **Drs. Stanley Goldman**, Kansas City; **Clement Sullivan**, St. Louis; and **Orval Withers**, Kansas City, were named to the Board of Directors.

William H. McAlister, M.D., St. Louis, was elected president-elect of the **Missouri Radiological Society** at a recent meeting in St. Louis. **Byron Watts**, M.D., Jefferson City, will serve as president for the coming year and **Ronald G. Evens**, M.D., will serve a second term as secretary-treasurer. A scientific meeting was held in conjunction with the business meeting.

The **Missouri State Surgical Society** held its election of officers in St. Louis in April. **Dr. Arthur Bane**, St. Louis, was elected incoming president and **Dr. Howard Linville**, Kansas City, was elected president-elect. **Dr. Hugh E. Stephenson, Jr.**, Columbia, is immediate past-president of the Society.

Dr. William M. Hart, chairman of the Department of Ophthalmology of the University of Missouri-Columbia, has been elected to fellowship in the Royal Society of Medicine in London. Dr. Hart founded the Eye Research Foundation of Bethesda, Md. and was a clinical professor of ophthalmology at the University of Maryland before he returned to the UMC School of Medicine to head the eye clinics and Ophthalmology Department at the Medical Center.

Dr. John Owens, Sedalia, was presented a plaque by the Sedalia-Pettis County United Way board of directors in recognition of his service as campaign chairman for the 1972-1973 United Fund campaign.

Dr. James C. Cope Named MSMA President-Elect

James C. Cope, M.D.

James C. Cope, M.D., Columbia, was elected President-Elect of the Missouri State Medical Association on April 1 at the final meeting of the House of Delegates during the 115th Annual Session in St. Louis.

Dr. E. A. Stricker, St. James, was installed as President of the Association at the session.

Dr. Cope is a Past-President of the Boone County Medical Society and has served several terms as MSMF Fifth District Councilor. He is the Immediate Past-Chairman of the Council.

He is active on the staff of the Boone County Hospital, is Associate Clinical Professor of Urological Surgery at the University of Missouri School of Medicine and is a urology consultant at the Ellis Fischel State Cancer Hospital.

Dr. Cope has long been involved in organized medicine and is a member of the Missouri Federation of Urologists, the American Urological Association and the American Medical Association. He has had scientific papers published in *The American Journal of Urology;* MISSOURI MEDICINE, the Journal of the Missouri State Medical Association; *Medical Economics;* and *The Rotarian.*

Dr. Cope received his undergraduate training at William Jewell College, his M.D. degree at New York University and his B.S. and M.A. degrees at the University of Missouri.

His hobbies include photography, woodworking and wine-making.

Dr. and Mrs. Cope reside in Rocheport and are the parents of three daughters.

**Gantrisin® (sulfisoxazole) Roche® provides
your patients with
many important advantages:**

- high urinary levels
- generally good tolerance
- high solubility at average urinary pH
- rapid absorption
- rapid renal clearance
- high plasma concentrations
- economy (average cost of therapy: less than 6½¢ per tablet)

**Before prescribing, please consult complete pr
information, a summary of which follows:**
Indications: Nonobstructed urinary tract infec
(mainly cystitis, pyelitis, pyelonephritis) due to
ceptible organisms. **Important Note:** ***In vitro***
**sitivity tests not always reliable; must be coordi
with bacteriological and clinical response.
aminobenzoic acid to follow-up culture medi
creasing frequency of resistant organisms limits
fulness of antibacterial agents, especially in ch
and recurrent urinary infections.** Maximum safe
sulfonamide blood level, 20 mg/100 ml; me
levels as variations may occur.
Contraindications: Hypersensitivity to sulfonam
infants less than 2 months of age; pregnancy at
and during the nursing period.
Warnings: Safety in pregnancy not establishe
not use for group A beta-hemolytic streptococc
fections, as sequelae (rheumatic fever, glomeru
phritis) are not prevented. Deaths reported
hypersensitivity reactions, agranulocytosis, ap
anemia and other blood dyscrasias. Sore throat,
pallor, purpura or jaundice may be early indica
of serious blood disorders. CBC and urinalysis
careful microscopic examination should be perfo
frequently.
Precautions: Use cautiously in patients with imp
renal or hepatic function, severe allergy or bron
asthma. Hemolysis, frequently dose-related, ma
cur in glucose-6-phosphate dehydrogenase-def
patients. Maintain adequate fluid intake to pr
crystalluria and stone formation.
Adverse Reactions: *Blood dyscrasias:* Agranu
tosis, aplastic anemia, thrombocytopenia, leukop
hemolytic anemia, purpura, hypoprothrombinemi
methemoglobinemia; *Allergic reactions:* Eryt
multiforme (Stevens-Johnson syndrome), genera
skin eruptions, epidermal necrolysis, urticaria, s
sickness, pruritus, exfoliative dermatitis, anaph
toid reactions, periorbital edema, conjunctival
scleral injection, photosensitization, arthralgia a
lergic myocarditis; *Gastrointestinal reactions:* Na
emesis, abdominal pains, hepatitis, diarrhea,

TWO BUILT-IN BENEFITS OF GANTRISIN®

sulfisoxazole/Roche®

1.

High urinary drug levels
Gantrisin quickly reaches peak antibacterial concentrations in the urine—usually in 2 to 3 hours. With the recommended dosage regimen, Gantrisin maintains these high urinary levels throughout therapy to combat such susceptible organisms as *E. coli, Klebsiella-Aerobacter, Staphylococcus aureus, Proteus mirabilis* and, less frequently, *Proteus vulgaris.*

2.

Generally good tolerance
Because of Gantrisin's high solubility and rapid excretion, therapy is relatively free of adverse reactions serious enough to require discontinuance of the drug (3.1% of 1002 patients in a recent study*). Even minor reactions are comparatively infrequent, but may include nausea, headache and vomiting. For other possible undesirable reactions, and precautions, please see summary of prescribing information on opposite page.

*Koch-Weser, J., *et al.*: *Arch. Intern. Med.*, *128* 399, 1971.

For nonobstructed cystitis

begin with

Gantrisin®
sulfisoxazole/Roche®

2 to 4 tablets *q.i.d.*

CHE

MSMA Woman's Auxiliary Elects Mrs. Charles R. Willman

Mrs. Charles R. Willman, St. Joseph, was elected President of the Woman's Auxiliary to the Missouri State Medical Association at the annual meeting at the Chase-Park Plaza Hotel in St. Louis on March 29-31.

Other Woman's Auxiliary officers elected for 1973-1974 are Mrs. George J. Lytton, Kansas City, President-Elect; Mrs. William R. McPhee, Kansas City, First Vice-President; Mrs. Ned B. Chase, Joplin, Second Vice-President; Mrs. George P. Wilson, Columbia, Third Vice-President; Mrs. Robert Stewart, Sedalia, Fourth Vice-President; Mrs. Thomas Thale, Ballwin, Recording Secretary; Mrs. Harry E. Raybuck, St. Louis, Treasurer; Mrs. L. O. Muench, Washington, Auditor; Mrs. Clem DuMont, St. Joseph, Corresponding Secretary; and Mrs. E. F. Butler, St. Joseph, Parliamentarian.

Mrs. Willman, whose monthly messages to members of the MSMA will appear regularly in Missouri Medicine, is a Past-President of the Buchanan County Medical Auxiliary. She served as President-Elect of the MSMA Woman's Auxiliary in 1972-1973 and as a Vice-President the previous year. She also has served as Recording Secretary (two years), Chairman of the Missouri Auxiliary's AMA-Educational Research Foundation (two years) and Radio-TV Chairman.

Mrs. Willman's participation in community affairs includes membership in the St. Joseph Hospital Guild and Methodist Hospital Association, for which she was treasurer for three years and is now serving as first vice-president. She also has served as president of the Women's Missionary League at St. Paul Lutheran Church and is on the Public Health Nursing Board, the Midland Empire Girl Scout Council Board and is a member of the Junior League.

Mrs. Willman is a graduate of Valparaiso University and Deaconess Hospital School of Nursing in St. Louis with a bachelor of science degree in nursing.

Dr. and Mrs. Willman have lived in St. Joseph since 1959. Dr. Willman, a surgeon, is a member of the Missouri Medicine Editorial Board. They are the parents of four daughters.

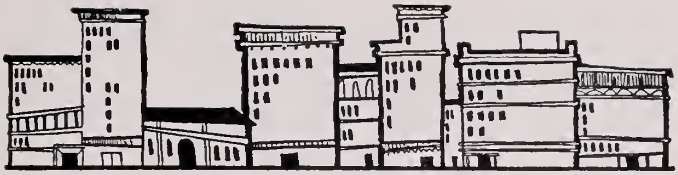
From the Medical Schools



WASHINGTON UNIVERSITY

Dr. David M. Kipnis, professor of medicine at the School of Medicine, spoke at a two-day symposium in Birmingham recently to dedicate the new Diabetes Research Institute at the University of Alabama-Birmingham Medical School. A well-known specialist in metabolic disorders, Dr. Kipnis pinpointed genetic engineering as a possible future cure for such medical problems as diabetes.

Dr. Kipnis said that much more research should go into the field of metabolic disorders, because "it holds a challenge for the future with exciting new ways to go." He said that genetic engineering is no longer science fiction and may hold the key to curing diabetes.

Dr. Herman N. Eisen has been appointed professor of immunology in the Department of Biology and a senior researcher at the newly-formed Center for Cancer Research at the Massachusetts Institute of Technology. Dr. Eisen has been professor and head of the Department of Microbiology at Washington University School of Medicine since 1961. Prior to 1961, he was professor of dermatology at Washington University, associate professor of industrial medicine at New York University and research associate in immunochemistry at the Sloan-Kettering Institute.

ST. LOUIS UNIVERSITY

Rev. Edward J. Drummond, S.J., vice-president for the St. Louis University Medical Center, joined administrators from DePaul Community Health Center and St. Vincent's Hospital Division of DePaul Community Health Center in the signing of contracts which established a joint medical education program in obstetrics between the institutions.

The affiliation was initiated last July when St. Louis University began sending its obstetrical patients to DePaul for hospitalization. *Anthony L. Bunker,* executive director of DePaul Community Health Center and one of the signers of the contract, said he believes the agreement "will be the first step in developing medical affiliation programs between the two facilities in other major services as well."

Father Drummond said the University and the hospital "through cooperative efforts, will be able to provide obstetrical service to more people in a more efficient manner." Under terms of the contract, the University provides a full-time faculty member as director of medical education for obstetrics at DePaul. He is *Dr. Ralph Woods,* associate professor of Gynecology and Obstetrics at the University's School of Medicine.

Joseph E. Lynch has been appointed assistant vice-president for Business and Fiscal Affairs at the St. Louis University Medical Center. He has been director of Business and Finance at the Medical Center since 1968. During this period, his main areas of responsibilities have been the formulation of budgetary and financial policies and plans for all operating units of the Medical Center. These have included the School of Medicine, School of Nursing, St. Louis University Hospitals and Departments of Orthodontics and Hospital and Health Care Administration. Mr. Lynch's offices are on the administrative floor of the School of Medicine.

Dr. Edward T. Auer, Samuel W. Fordyce Professor of psychiatry and chairman of the Department at the St. Louis University School of Medicine, has been named a Charter Fellow of the American College of Psychoanalysts. Fellowship in the College is awarded in recognition of contributions in psychiatry and psychoanalysis and national stature in the field and the great esteem of friends and colleagues.

Dr. Theodore A. Cooper, director of the National Heart and Lung Institute, will deliver a commencement address before the 1973 medical graduates at Senior Class Day Ceremonies to be held in Powell Symphony Hall on May 29. Dr. Cooper received both the M.D. and Ph.D. degrees from St. Louis University.

Dr. Rodney Coe, professor of community medicine, has been elected secretary of the Gerontological Society, a national organization of teachers, researchers and practitioners interested in the field of aging. His term is for a three-year period expiring in November, 1975.

UNIVERSITY OF MISSOURI-COLUMBIA

Dr. Ruby Potter, associate dean of the University School of Medicine in charge of the School of Nursing, was honored at an open house at the School of Nursing and at a reception banquet at the Memorial Union on March 31. She will retire in September.

A program entitled, "This Is Your Deanship," depicted various periods of Dr. Potter's life including her early life, her nursing education and her nursing career. Members of her family and friends from these periods participated in the program.

An oil painting of Dr. Potter, commissioned by alumni, faculty and friends, was presented to University Chancellor *Herbert Schooling* to be hung in the library of the School of Medicine.

J. Kenyon Taylor, Columbia, a second-year University medical student, received the Student Research Award at a meeting of the Southern Society for Clinical Research and the America Federation for Clinical Research in New Orleans. Kenyon's research was on experimenta kidney disease in the mouse.

Research on the venom of the poisonou brown recluse spider at the University of Missouri Medical Center under the direction o *Professor James T. Barrett* and *Professor Benedict J. Campbell* of the Departments of Microbiology and Biochemistry is the subject of tw reports at national meetings. In each instance local scientists will describe special aspects o the progress made on their portion of a larg scale program supported by a National Institutes of Health research grant.

At the first meeting on April 15-20, *Mr. Klau Elgert,* a Ph.D. candidate in the Department o Microbiology, described before an assembly o the American Association of Immunologist how he has produced a radioactive spider venom. Another Ph.D. candidate in the Departmen of Microbiology, *James Finke* of Joplin, wil present a research report to the American Society for Microbiologists at the annual meetin on May 6-11 in Miami Beach.

STUART PHARMACEUTICALS | Division of ICI America Inc. | Wilmington, Del. 19899 | Pasadena, Calif. 91109

"Antiacid" action for ulcer patients..

one of the many things you need in an anticholinergic.

Pro-Banthīne is provided in several different dosage forms and combinations which will meet virtually any clinical need. It is just as versatile in filling patient needs, among which are:

"**Antiacid**" **action**—Pro-Banthīne® (propantheline bromide) reduces gastric secretory volume and resting total and free acid.

"**Sustained**" **action**—Pro-Banthīne P.A.® (propantheline bromide) contains 30 mg. of the drug in the form of sustained-release or timed-release beads; on ingestion about half of the drug is released within an hour and the remainder continuously as earlier increments are metabolized.

High-level anticholinergic activity is maintained all day and all night in most patients with only two tablets every eight hours.

"**Analgesic**" **action**—Pro-Banthīne helps to control the acid-spasm-pain complex.

A "**diagnostic tool**"—Pro-Banthīne may be used parenterally to immobilize the duodenum for more revealing roentgenographic appraisal through hypotonic duodenography.

Pro-Banthīne is considered adjunctive in total peptic ulcer therapy that may include diet, conventional antacids, bed rest, and other supportive measures.

Vigorous anticholinergic action — Pro-Banthīne® Vials, 30 mg., are for intramuscular or intravenous use when prompt and vigorous anticholinergic action is required.

Mild anticholinergic action—Pro-Banthīne® Half Strength, 7.5-mg. tablets, for more exact adjustment of maintenance dosage in mild to moderate gastrointestinal disorders.

Indications: Pro-Banthīne is effective as adjunctive therapy in the treatment of peptic ulcer. Dosage must be adjusted to the individual.

Contraindications: Glaucoma, obstructive disease of the gastrointestinal tract, obstructive uropathy, intestinal atony, toxic megacolon, hiatal hernia associated with reflux esophagitis, or unstable cardiovascular adjustment in acute hemorrhage.

Warnings: Patients with severe cardiac disease should be given this medication with caution.

Fever and possibly heat stroke may occur due to anhidrosis.

In theory a curare-like action may occur, with loss of voluntary muscle control. For such patients prompt and continuing artificial respiration should be applied until the drug effect has been exhausted.

Diarrhea in an ileostomy patient may indicate obstruction, and this possibility should be considered before administering Pro-Banthīne.

Precautions: Since varying degrees of urinary hesitancy may be evidenced by elderly males with prostatic hypertrophy, such patients should be advised to micturate at the time of taking the medication.

Overdosage should be avoided in patients severely ill with ulcerative colitis.

Adverse Reactions: Varying degrees of drying of salivary secretions may occur as well as mydriasis and blurred vision. In addition the following adverse reactions have been reported: nervousness, drowsiness, dizziness, insomnia, headache, loss of the sense of taste, nausea, vomiting, constipation, impotence and allergic dermatitis.

Dosage and Administration: The recommended daily dosage for adult oral therapy is one 15-mg. tablet with meals and two at bedtime. Subsequent adjustment to the patient's requirements and tolerance must be made.

Pro-Banthīne P.A.—Each tablet of Pro-Banthīne P.A. (propantheline bromide) contains 30 mg. of the drug in the form of sustained-release or timed-release beads; on ingestion about half of the drug is released within an hour and the remainder continuously as earlier increments are metabolized. Thus the result is even, high-level anticholinergic activity maintained all day and all night in most patients with only two tablets daily. Some patients may require one tablet every eight hours.

The contraindications and precautions applicable to Pro-Banthīne 15 mg. should be observed.

How Supplied: Pro-Banthīne is supplied as tablets of 15 and 7.5 mg., as prolonged-acting tablets of 30 mg. and, for parenteral use, as serum-type vials of 30 mg.

in Brief

A summary of AMA, medical & health news

American Medical Association/535 North Dearborn Street/Chicago, Illinois 60610/Phone (312) 527-1500/TWX 910-221-0300

The AMA Annual Convention will have a new schedule this June in New York City. It will open Saturday, June 23, a day when most physicians are not in their offices and will be able to attend postgraduate courses and exhibits. The regular scientific sessions will open Sunday at 9 AM and end Wednesday, June 27, at 5 PM. On Thursday, June 28, all physicians will be free to attend the House of Delegates meeting without program conflict.

A **television series** titled "Today's Health" is now in production. The half-hour programs will be produced for syndication by Gittelman Film Associates in association with the AMA magazine *Today's Health*. Material from the magazine will be used on the programs. AMA President C. A. Hoffman, M.D., said, "Much of the health information directed at the public today is of questionable validity. *Today's Health* will present accurate information in an entertaining manner and we at the AMA are happy to be able to participate in such a venture."

Project USA, the AMA's program to provide volunteer physicians as short-term replacements for National Health Service Corps physicians in areas with critical medical shortages, has received 600 requests for information. Twenty-one physicians have been cleared through civil service and are ready for assignment, and 25 others are in the process of being cleared. Direct inquiries to Project USA, AMA Headquarters.

AMA specialty journals will continue as a benefit of membership, the Board of Trustees voted. The journals were scheduled to be distributed on a subscription basis beginning in July. The Board's action was taken in response to the views of the membership and as a result of a management reappraisal of the financial situation of the journals. Members will also receive *Prism*, the AMA's new socioeconomic journal.

Medicare investigative reports completed after Jan. 31 will be made public, the Social Security Administration announced. They include reports on deficiencies in institutions, home health agencies and independent laboratories, as well as evaluations of carriers, intermediaries, state agencies and providers. The names of physicians found to have furnished excessive services will be released only "after consultation with a professional medical association" or a state medical authority and after the physician has had an opportunity to offer evidence. These points on physicians were not contained in the regulation when it was proposed last September. They apparently were added in response to criticism from the AMA and others.

The AMA House of Delegates last November urged state medical society representatives to utilize the "guidance and assistance" of the AMA's Washington Office when visiting members of Congress. Services include a briefing on health-related bills, activities of the executive branch and AMA legislative proposals. The Washington Office was utilized by representatives from 31 state medical associations last year. Contact AMA Field Offices to arrange for services.

Available from AMA: A new edition of *Medicolegal Forms with Legal Analysis*. Write Order Dept., Reference No. OP-109, AMA Headquarters. For *AMA Guidelines for Physicians in Their Relations with the Communications Media*, write to Dept. of Medical Ethics, AMA Headquarters. For *Computers and Medicine*, a bimonthly newsletter, $5 a year, write to Subscription Services, AMA Headquarters.

Rocky Mountain Spotted Fever in Children

Case Reports

Rocky Mountain Spotted Fever (RMSF) is a tick-borne infection caused by Rickettsia rickettsii, an intracellular microorganism usually classified in an intermediate position between bacteria and viruses. After its identification in 1911, the number of reported cases in this country rose steadily from 1920 to the late 1940s and then began to decline coincident with, but not necessarily secondary to, the increased use of broad spectrum antibiotics.[1] Before 1940, most cases, as the name would indicate, were reported from the Rocky Mountain area. During the past ten years, the number of cases, which has again increased to 300 to 500 per year, were reported mostly from the southeast states and are predominantly in children.[2] There were only five reported cases in the state of Missouri in 1971.[3]

During the month of August, 1972, there were two cases of RMSF referred to the pediatric service of the University of Missouri Medical Center from South Central Missouri with the diagnosis of fever of unknown origin. This paper points out the classic as well as recently-recognized features of this illness with the hope that physicians can more readily identify this potentially fatal infectious disease.

Case Reports

Case # 1. A 16-month-old white boy was referred to our service on Aug. 20, 1972 with a generalized petechial rash and fever of unknown origin. The child's illness began two weeks prior to admission with onset of fever and an erythematous macular rash which the parents first observed on the cheeks and abdomen. It soon became more intense over the extremities.

After one week of intermittent temperature, the patient was taken to his personal physician. The diagnosis of "Strep infection" was made. The patient was given an intramuscular injection of penicillin and was continued on a regimen of ampicillin administered orally. Over the next few days, the child remained febrile and the rash became more discrete

Rocky Mountain spotted fever, a tick-borne rickettsial infection, is infrequently reported in the state of Missouri. This disease should be kept in mind when the physician is dealing with fever of unknown origin associated with a rash. To aid in the diagnosis, special attention should be paid to inquiring about the patient's exposure to ticks, evolution of the rash, the systems involved and laboratory tests. Dr. Laycob is Chief Resident and Dr. Eduardo Garin is a first-year Resident in the Department of Pediatrics at the University of Missouri Medical Center. Formerly Assistant Professor in the Department of Internal Medicine, Section of Immunology, Rheumatology and Infectious Disease at the Medical Center, Dr. Lerner is now on the staff of E. J. Meyer Memorial Hospital, Buffalo, N. Y.

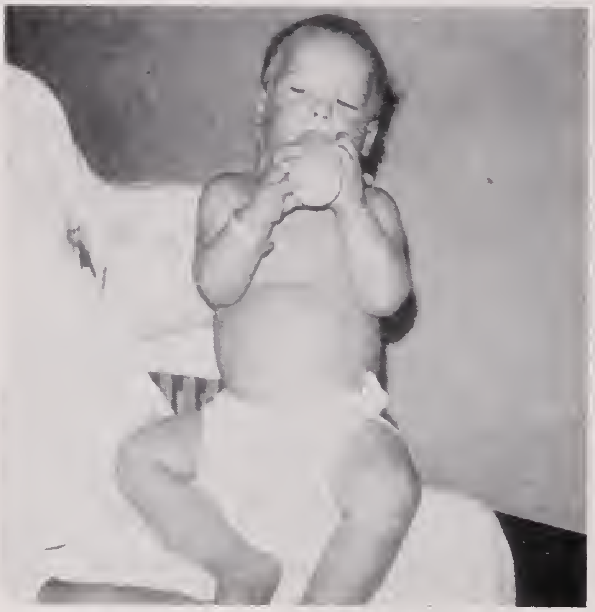

Fig. 1 Case Report # 1: Generalized petechial rash, more intense on the extremities. Note edema of the upper eyelids.

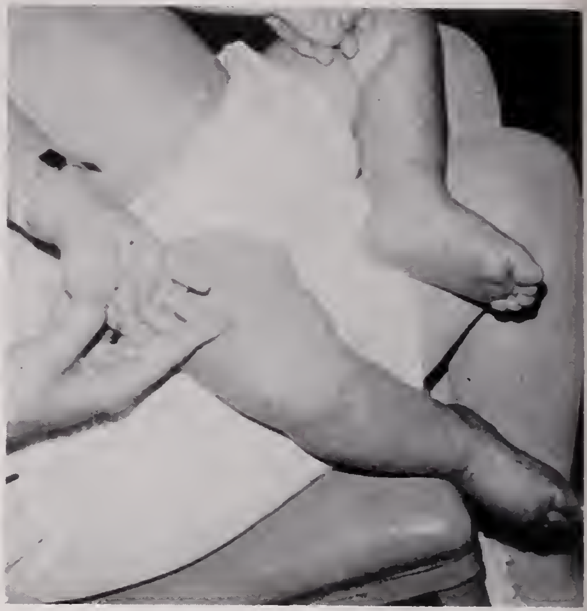

Fig. 2 Case Report # 1: Rash of palms and soles and edema of the feet.

and darker. The patient, with a temperature of 105 F, was seen again by a physician on August 20, given oral doses of erythromycin and referred to UMMC. In addition to the above information, it was noted in the admission history that the patient visited his aunt's house in Rolla two days before the onset of this illness. The aunt owned two dogs from whom ticks were periodically removed.

The patient had had no illnesses during infancy prior to the onset of the present illness. He had not received any immunizations. His growth and development were within normal limits (WNL).

Physical examination revealed a well nourished infant with a rectal temperature of 105 F; pulse rate, 148 beats per minute; respiration rate, 46 per minute; weight, 12 Kg. A generalized petechial rash was present (Figs. 1 & 2). It was more intense on the extremities, which involved the palms and soles, and did not blanch on pressure. There were ecchymoses over both elbows. The patient had facial edema, injected conjunctivae and a croupy cough. The chest was clear and there were no heart murmurs. The liver was palpable 3 cm below the right costal margin. The spleen was not enlarged. A neurologic examination was within normal limits and there were no meningeal signs on admission.

Laboratory studies revealed the following values: hemoglobin, 6.8 gm/100 ml; hematocrit reading, 19%, white blood cell count (WBC) 8,700/cu mm with 66% neutrophils, 30% lymphocytes, 3% monocytes, 1% eosinophils; platelet count, 36,000/cu mm; and reticulocyte count, 0.3%. Blood urea nitrogen and electrolytes were WNL. The urinalysis was negative except for occult blood. Chest x-ray was WNL. A bone marrow aspiration performed on the first hospital day showed normal morphology, including megakaryocytes. Direct Coombs test was negative. A mononucleosis spot test was negative. Prothrombin time and partial thromboplastin time were WNL. Fibrinogen level was quantitatively below normal. Fibrin split products were not found. On the second day, serology reported positive dilutions of Proteus OX-2 1:320 and OX-19 1:320.

On the basis of the clinical findings and the presumptive laboratory tests, the patient was felt to have Rocky Mountain spotted fever. After blood was drawn for an acute phase complement fixation test for RMSF, he was given 60 mg/Kg day of chloramphenicol in four divided oral doses.

On the third day, several observers felt that the patient had signs of meningeal irritation. A lumbar puncture was performed and showed a red blood cell count (RBC) of 1/cu mm and a WBC of 45/cu mm with 78% PMNS and 22% lymphocytes. The cerebrospinal fluid (CSF) protein was 56 mg/100 ml and CSF glucose was 59 mg/100 ml. A smear showed no pathogens and a culture grew no organisms.

Hospital Course: After the initiation of therapy, the patient's temperature returned slowly to the normal range over the next 48 hours. There also was an abrupt rise in hemoglobin, hematocrit reading, reticulocyte count and platelet count. The antibiotic was continued until the patient remained afebrile for seven days. By this time, the rash was clearing, the croupy cough had resolved and there was no longer any evidence of meningeal irritation. After discharge, a convalescent phase complement fixation titer was drawn by the referring doctor and reported by the State Division of Health in Jefferson City, Missouri as positive for RMSF at a 1:256 dilution. (The acute phase titer was less than 1:8.)

Case # 2. The patient was a 13-year-old white boy who, 12 days prior to admission at UMMC, developed fever to 105 F. This was followed four days later by a rash appearing first on extremities, with involvement of palms and soles, and then spreading to the face and trunk. The rash was initially maculopapular and erythematous, but it became petechial on extremities. As the fever continued, the patient was admitted to a local hospital for diagnostic evaluation. Hematology profile showed a hemoglobin level of 12 gm/100 ml; hematocrit reading, 37%, and WBC, 5,000/cu mm with 86% neutrophils.

Serology studies requested at the end of the first week for typhoid, brucella, tularemia and rickettsial (Proteus OX-19 only) were negative. Because a chest x-ray reportedly showed infiltrates, the patient was given ampicillin. After ten days, he was still febrile although the rash appeared to be fading. He was then transferred to the University of Missouri Medical Center for further evaluation.

On admission, history revealed (in addition) that four days before the onset of his fever, the patient had removed a tick from his groin when working on a farm in his community.

A physical examination revealed an alert, white boy in no acute distress but appearing weak, with an oral temperature of 101 F, pulse rate 94/min and regular; respiration rate of 14/min; blood pressure, 110/62; and weight, 42.3 Kg. There was a maculopapular rash on the trunk, face and extremities, including the palms and soles, which blanched with pressure except for some petechial areas on the extremities. The conjunctivae and the throat were injected. The chest was clear and there were no heart murmurs. The edge of the liver was tender and palpable 2 cm below the right costal margin. The spleen was not palpable. The patient was complaining of pain at the left elbow. There were no signs of arthritis, and he was able to slowly extend the elbow joint without pain.

Laboratory data studies revealed the following values: hematocrit reading, 34%; hemoglobin level, 9.1 gm/100 ml; WBC, 9000/cu mm; and platelet count, 260,000/cu mm. Prothrombin time and partial thromboplastin time were WNL. The urinalysis also was normal. Serology studies showed an OX-19 titer of only 1:20, but the OX-2 was positive in 1:2560 dilution.

Hospital Course: It was our clinical impression that the patient had RMSF and therapy with tetracycline at 50 mg/Kg/day in four divided oral doses was started before the OX-2 titer was reported. The patient became afebrile on the second day and his general condition slowly improved. The rash continued to fade during his hospital stay. On the fourth day, he was discharged to complete the ten-day course of tetracycline therapy at home. A convalescent stage complement fixation titer drawn by the referring doctor was reported by the State Division of Health in Jefferson City as positive for RMSF at greater than 1:1024 dilution.

DISCUSSION

Clinical Findings

RMSF in man is generally acquired from the bite of an infected tick. The most important vectors in the midwest and Atlantic states are the American dog tick (Dermacentor variabilis) and the wood tick (Dermacentor andersoni) in the Rocky Mountain area.[4] *The two case presentations point out that a common diagnostic pitfall in RMSF is the failure of the physician to inquire about exposure to ticks or tick bites.*

Infections occur most frequently from May to August, corresponding to the high prevalence of ticks at this time of the year.[4] Symptoms can appear from two to 14 days after the tick bite with a shorter incubation period in the more severe cases.[5]

The onset of clinical manifestation is usually abrupt with fever reaching 103 F to 104 F, accompanied by severe frontal headaches and generalized myalgia. A recent report has emphasized the presence of conjunctivitis in this prodromal period.[6] A cutaneous eruption usually appears on the second to fourth day of the illness. The rash is macular, red and flat and appears initially on ankles and wrists, spreading rapidly to involve the entire body, including palms and soles, over the next six to 12 hours. It becomes maculopapular after two to three days. By the fourth day, it is petechial and fails to fade with pressure. *The evolution of the rash in RMSF with its centripetal spread and transition to petechial appearance is the earliest dependable diagnostic sign.* During the eruptive stage, the fever remains high (104 F) with early morning remissions. In untreated cases, the fever may persist for two to three weeks before breaking. Recurrent fever is uncommon except in the presence of secondary pyogenic complications. In mild and moderate cases, the rash will begin to fade during the second week, but in more severe cases, it will be slowly replaced by brownish discolorations which may persist for several weeks during convalescence.

RMSF, like other rickettsiae, is a true infectious vasculitis. There are a variety of findings including the rash indicating vascular involvement of many organs.[7, 8] During the early stages, the patient's pulse is usually accelerated proportionally to the temperature and the blood pressure is well sustained. In severe cases, however, signs of congestive heart failure may be present because of myocardial involvement. In other patients, decreased blood pressure and increased pulse rate are the manifestations of peripheral collapse due to vasculitis, vasodilatation and hypovolemia.

Respiratory symptoms are not uncommon. There is usually a persistent, nonproductive, croupy cough. Localized pneumonitis can occur, whereas pulmonary consolidation is rare and usually indicates a secondary bacterial infection.

Splenomegaly can be found in about 50% of of the cases.[6] A nontender hepatomegaly is usually present, but jaundice as a manifestation of liver dysfunction is rare. The kidneys can be involved in the general vascular process, but renal failure occurs in the severe cases only.

Vasculitis is probably responsible for the periorbital and nonpitting edema which are important diagnostic signs.[8] The vasculitis in severe cases can progress to thrombosis of small blood vessels with resultant gangrene. Mengel[9] was one of the first to call attention to the manifestation of thrombocytopenia in RMSF. Others have since reported cases of RMSF with multiple coagulation defects including thrombocytopenia and hypofibrinogenemia, which we noted in our first case.[10–12]

Evidence of central nervous system (CNS) involvement is common. A recent report emphasizes that the presence of neurologic signs is "ominous" as this is often related to structural damage of the nervous system.[13] The patient can occasionally present with headache, altered sensorium and meningeal signs before the appearance of the rash and cloud the physician's recognition of RMSF. The cerebrospinal fluid frequently shows increased pressure, pleocytosis (usually less than 300 cells/cu mm) and elevated protein. These gradually return to normal as the patient recovers. As a rule, all the neurologic symptoms abate without any residual.

Before the advent of broad spectrum antibiotics, the mortality rate ranged from 13% to 41%, the rate rising with advancing age.[5] Recently, Haynes[6] reported only three deaths (about 4%) in a series of 78 children with RMSF. They succumbed early to the serious complications of RMSF, i.e., vascular collapse, myocarditis and interstitial pneumonitis which were seen frequently before specific antibiotic therapy was known.

Laboratory Diagnosis

There are two commonly employed serologic tests for RMSF. The Weil-Felix test involves agglutination of the patient's serum with strains of Proteus bacilli OX-19, OX-2 and OX-K and may be positive in several of the rickettsial diseases. *In RMSF, there is a great variation in degree and type of responses with the above agglutinations and titers for both OX-19 and OX-2 should be requested.* The typical responses are either a high OX-19 and low OX-2, elevation of both OX-19 and OX-2 or, occasionally, a low OX-19 and a high OX-2.[14] A titer of 1:320 is considered of diagnostic significance. As mentioned in the second case presentation, the local hospital laboratory performed only the OX-19 agglutination which was negative. This, no doubt, was misleading to the referring doctor.

The Weil-Felix agglutinins can appear as early as the fifth day of the illness and are almost always present by the 12th day.[15] They disappear within several months.

The complement fixation test utilizes specific rickettsial antigens and, therefore, is helpful in differentiating the rickettsial diseases. Many hospitals are not equipped to run this test, but acute and convalescent serum specimens can be sent to the State Division of Health in Jefferson City. Complement fixation antibodies usually appear two to three weeks after the onset of RMSF and may persist for years.[15]

Differential Diagnosis

The rash of rubeola, meningococcemia, typhoid fever, ECHO viruses, idiopathic thrombocytopenia purpura, endemic typhus and Henoch-Schönlein purpura can be confused with that of RMSF. The spread of the rash from distal portions of the extremities to the trunk with involvement of the palms and soles virtually rules out the others. With a history of a tick bite in the summer months followed by fever, rash, headache, myalgia, conjunctivitis and periorbital edema, a clinical diagnosis of RMSF can be made and therapy instituted without waiting for the Weil-Felix reaction to turn positive.

Treatment

The broad spectrum antibiotics tetracycline and chloramphenicol are considered equally effective in treatment of this disease. The recommended oral dose is 50 to 100 mg/Kg/day divided into four equal doses and not to exceed a maximum total daily dose of 4 gm in adults. If the intravenous route is used for a severely

Reversible Hearing Loss Due to Ethacrynic Acid in Occult Renal Failure

Case Report

The ototoxic effects of ethacrynic acid have received recent attention in the medical literature.[1-7] Pillay[1] has described three patients in whom the deafness was permanent, and a recent report describes ototoxicity with the combined use of ethacrynic acid and aminoglycoside antibiotics.[3] The purpose of this report is to describe a case in which, in the absence of antibiotics, ethacrynic acid alone was a causative factor and to show the temporal sequence of recovery from the ototoxic effect of this drug. In this patient, poor renal function was suspected only after the development of hearing loss.

Case Report

A 69-year-old Negro woman with known diabetes mellitus was admitted to the hospital because of the sudden onset of bilateral hearing loss which occurred two weeks prior to admission. The patient stated that she had had no hearing problem in her past history. She had experienced slight tinnitus prior to the onset of ENT symptoms, but there was no vertigo, nausea or vomiting. Her drug history revealed that for the previous ten months she had been receiving 250 mg of chlorpropamide (Diabinese) daily for diabetes; reserpine, 0.25 mg qid; and chlorthalidone (Hygroton), 100 mg od for hypertension. She was started on a regimen of ethacrynic acid, 50 mg od two months prior to admission for peripheral edema and she had taken this drug regularly, the total amounting to approximately 3 gm over this period of time.

Otolaryngology evaluation revealed bilateral neurosensory hearing loss (Fig. 1). The patient could hear only if words were shouted loudly into her ear. Laboratory investigations showed a blood urea nitrogen (BUN) value of 80 mg/100 ml and a hematocrit value of 28%. The serum electrolytes were Na-128 mEq/L, K-4.5 mEq/L, Cl-100 mEq/L and CO_2-17 mEq/L. Endogenous creatinine clearance was 26 L/24 hours. Physcial examination was unremarkable except for the hearing deficit. A complete evaluation for the patient's anemia and reduced renal function led to the tentative diagnosis

In this case report, poor renal function in the patient was suspected only after the development of hearing loss. Ethacrynic acid alone is believed to be the causative agent. This case emphasizes the importance of being aware of the toxic effects of this drug and the utilization of serial audiograms to determine if recovery is being made. The authors are from the Departments of Internal Medicine and Otolaryngology, St. Louis University School of Medicine.

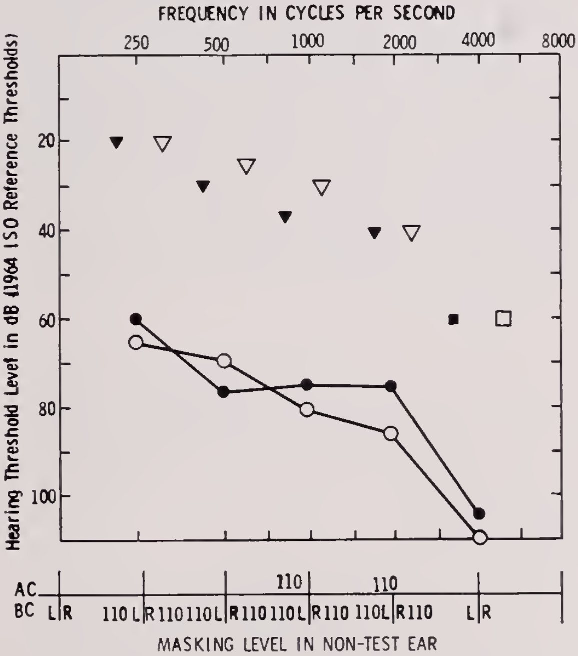

Fig. 1 The patient's audiometric evaluation upon admission to the hospital indicates severe bilaterial hearing impairment.

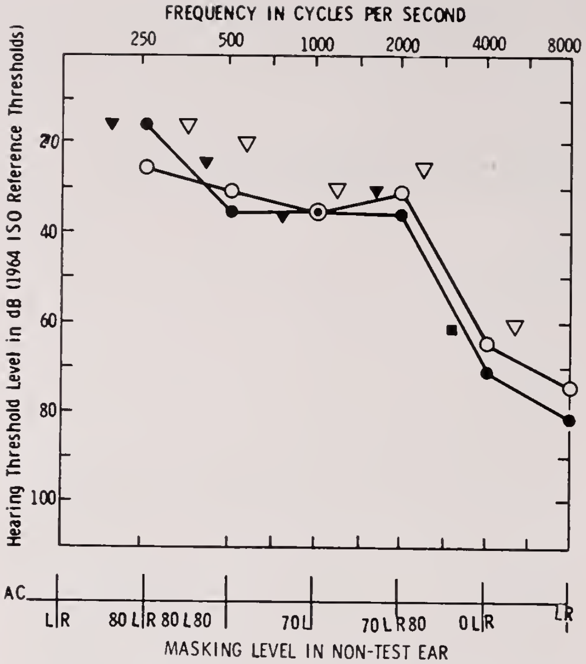

Fig. 2 Audiometric evaluation 15 days after discontinuance of ethacrynic acid therapy. The obvious noticeable improvement in hearing in both ears is seen. Loss in the higher tones appears to be sensorineural bilaterally with excellent discrimination.

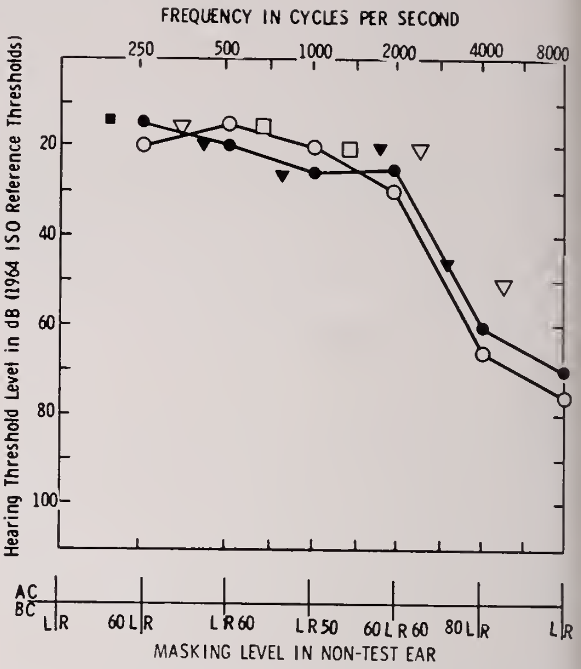

Fig. 3 The patient's evaluation three months later shows marked improvement over the initial evaluation.

of diabetic nephropathy and anemia secondary to renal disease.

Medications were discontinued because of the suspicion that the hearing loss was drug-induced. The patient's hearing improved dramatically within 48 hours (Fig. 2). Audiograms performed at serial intervals confirmed this improvement (Fig. 3). Since this patient, who had been receiving other medications for more than a year without complaining of hearing difficulty, developed a hearing deficit shortly after initiation of ethacrynic acid therapy and since the hearing loss disappeared following discontinuance of the drug, ethacrynic acid alone seems to have been the causative agent.

DISCUSSIONS

The ototoxic effects of this diuretic agent have been attributed to (1) a direct toxic effect on the outer hair cells and alteration of cochlear microphonic potentials,[5] (2) retention of cysteins adducts or other potentially toxic metabolites of the drug in patients with reduced renal function[2] and (3) alteration of the composition of cochlear fluid or supporting cells. In this latter regard, the recent work of Vinnikov and Koichev[8] is pertinent. They found that the localization of sodium in the spiral organ was related to quiet exposure to sound. Different levels of sound exposure led to a sharp increase in the number of sodium-containing granules on the stereocilia membrane of the receptor cells. As a result of their studies, they believed that this increase in the quantity of reaction-products in the cilia of the receptor cells following exposure to sound probably was due to an increase in permability to sodium ions which edema affects.

The drug also has been shown to have effects on the intermediary metabolism of renal tissue.[9] Ethacrynic acid also is known to affect sodium reabsorption in the kidney and this effect has been ascribed to binding of sulfhydryl groups and a oubainlike effect on Na^+-K^- dependent ATPase. This effect has been noted not only in the kidney, but recently it has been reported in the gastrointestinal tract.[10]

Whether or not this may be a generalized action which possibly alters NA^+ migration in the ear is not known. The fact that our patient, who did not receive as much as 3 gm over a two-month period, showed complete reversibility makes awareness of the toxic effects of this drug important and demonstrates the assistance of utilizing serial audiograms to determine whether or not recovery is being made. We, therefore, would concur with Pillay and others who have recommended serial audiograms even in those patients with no known renal disease and, also, that the drug definitely be stopped at the first sign of ototoxicity. Likewise, any patient demonstrating any diminution in hearing while receiving this drug should receive complete renal evaluation, as previously unrecognized impaired function may then become apparent.

Rocky Mountain Spotted Fever

(Continued from page 306)

toxic child, 30 mg to 40 mg/Kg/day of either drug should be administered in three equal doses.[16] Carver[17] suggests that therapy be continued until the patient is afebrile for at least one week to lessen the chance of a relapse.

SUMMARY

Reports of two patients with RMSF, ages 16 months and 13 years, referred to the University of Missouri Medical Center with a diagnosis of fever of unknown origin are presented and salient features of the disease are discussed. To aid the physician in the diagnosis of this potentially fatal infectious disease which is infrequently reported in this state, special emphasis has been placed on inquiring about exposure to ticks, evolution of the rash, multiple system involvement and laboratory tests. Early recognition and initiation of antibiotic therapy is highly essential in minimizing morbidity and mortality.[13]

Fetal Monitoring Experiences in a Private Hospital

The traditional method of following the fetal condition during labor has been with auscultation for determining the fetal heart rate and palpation for determining the force and frequency of contractions. However, the inherent vagaries in such a method due to the resultant spot-checking approach has resulted in a number of researchers being concerned with the need for a method of continuous monitoring for labor. Subsequently, a number of persons have suggested the desirability, as well as the advisability, of applying electronic methods to monitoring labor. The most common form available today is continuous measurement of the fetal heart rate, which is shown on a paper tracing, together with a simultaneous reading of the intra-amniotic pressure. Favorable results of such an approach have been reported widely in the literature over the past several years. However, in recent months, one writer has suggested that electronic techniques of monitoring labor are not as practical as previously reported.[1]

Since most of these papers have been from research institutions, we feel experiences with the fetal monitor in a private hospital would be of interest to the private physician. We, therefore, report the results of our first 100 cases of fetal monitoring.

A group of 100 parturients, who were followed through labor with the fetal monitor, includes a wide spectrum of patients with a preponderance of having complications of pregnancy or labor. The authors described these complications and the method of monitoring and summarize the results in tables on the basis of five-minute Apgar scores. Two examples of abnormal tracings are presented. The authors are from the Department of Obstetrics and Gynecology at St. Luke's Hospital. This work was supported by the St. Luke's Hospital Foundation for Medical Education and Research.

The indications of fetal distress as shown by such monitoring have been reported by a number of workers and are well documented.[2-6] Our tracings were interpreted with these findings in mind. Therefore, the discussion of criteria for interpretation of such tracings will be left to more experienced writers.

Material and Methods

One hundred patients monitored during labor were chosen for study. These patients were the first 100 we monitored successfully. Since we use intra-amniotic pressure determinations as well as fetal scalp electrodes, the patients were not connected to the monitor until they had at least a 2 cm-3 cm cervical dilation. In forty-nine of the cases, the patients demonstrated some abnormal condition during their pregnancy or labor. These included breech presentations, induction or stimulation of labor, intrauterine death and cephalo-pelvic disproportion. The period of study covers the calendar year of 1970.

The recorder used is a Corometrics 101 or 102 recorder for fetal heart rate and intra-amniotic pressure. There is a simultaneous oscilloscope tracing of the fetal electrocardiogram. This is used in conjunction with a Corometrics 401 central monitor which has an oscilloscope read-out for the fetal heart rate and intrauterine pressure, corresponding to the paper tracing on the 101/102. This central monitor is located at the nurses' station. Amniotic pressure is recorded by use of a polyethylene tube filled with sterile water and inserted into the amniotic cavity. The other end of the catheter is attached to a Stathan pressure transducer which, in turn, is attached to the recorder. The Hon clip electrode[7] is attached to the fetal scalp. The leads from this are connected to a junction box on the mother's thigh which contains a neutral or ground electrode in contact with the skin. This is attached to the thigh with a Velcro band. A lead connects this to the recorder.

Two approaches are used for attaching the apparatus to the patient. One method is with digital examination. With this method, the catheter is placed between the presenting part and the posterior lip of the cervix. This is done at 2 to 3 cm cervical dilation. It is placed through a plastic catheter guide which is then removed. The electrode is then placed merely by finding the presenting part with digital examination and with the fingers guiding the electrode and applying forcep through the cervix. The alternative method uses the same approach for inserting the intrauterine catheter. However, the electrode is placed under direct visualization using a plastic disposable amnioscope.

As noted above, the resultant permanent records include a fetal heart rate tracing and an intra-amniotic pressure tracing on a paper graph done with a hot needle. These are simultaneously plotted against time. Fetal electrocardiograms may then be recorded with a standard electrocardiogram machine attached to the recorder with appropriate patch cords. These are not done on all patients.

TABLE 1

Condition Demonstrated on Tracing	*No. of Cases*	**Apgar 9-10*	**Apgar 7-8*	**Apgar 5-6*	**Apgar 3-4*

Uteroplacental insufficiency	8	6	—	1	1
Bradycardia	4	4	—	—	—
Acceleration	1	1	—	—	—

* Apgar score at five minutes.

RESULTS

The results of our series are shown in Table 1. It should be noted that we had technical difficulty in only one case resulting in an uninterpretable tracing. This was due to difficulty in attaining proper placement of the intrauterine catheter. The interpretation of the tracings was made on the basis of other persons' research, as previously noted. The first column in the table indicates the various abnormalities found in the tracings. The second column shows the number of cases that were found to demonstrate each of these findings. The remainder of the table is a breakdown of the number of patients in each of these groups on the basis of the five-minute Apgar scores of the infants. The number of patients who demonstrated some degree of abnormality of the fetal heart tracing underwent attempts at correction. These were change of position as well as administration of oxygen by mask.

The distribution of patients showing complications of pregnancy or labor is shown in Table 2. Continuous monitoring was done on complicated patients for the reasons indicated in the left hand column of the table. In the case of the one stillborn infant, the monitor was applied after auscultatory methods, including electronic auscultation, demonstrated no fetal heart tones. This was, in a sense, a diagnostic procedure. This particular labor was then followed with the intra-amniotic pressure device until delivery of the stillborn infant. The two cases with diabetes mellitus were induced at 36 weeks and proceeded without demonstrable abnormality in the tracings. These infants were in good condition at the time of delivery. In the cases

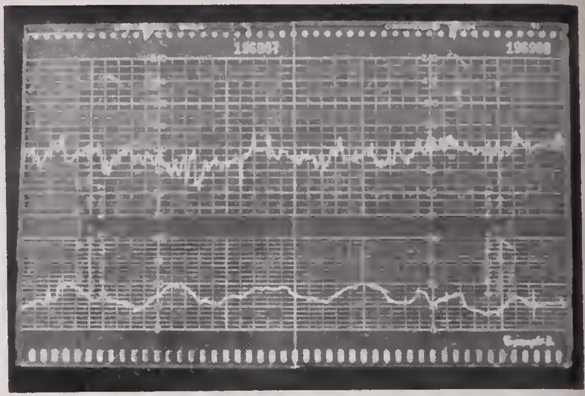

Fig. 2 Portion of tracing showing impaired fetal condition and demonstrating bradycardia.

of the two monitored twin pregnancies, it was the first twin who was monitored with the attachment of the electrode to the presenting part of this twin in each case. In the breech presentations, the electrode was attached to the presenting part. In each of the three cases of possible cephalopelvic disproportion, a trial at labor was attempted. Two of these patients subsequently required delivery by section. The third was delivered vaginally. The most common indication for use of the monitor was the application of oxytoxics for induction or stimulation of labor. In these cases, the monitor resulted in a more thoroughly observed labor.

In this series, a total of four cesarean sections were performed. Two of these were performed for cephalopelvic disproportion. The remaining two were performed because the monitor tracing demonstrated some abnormality. In one of these cases, that abnormality was the one described for cord compression. The changes were quite severe (Fig. 1). The other case, showing impaired fetal condition, demonstrated bradycardia (Fig. 2). It should be noted that each of these infants had a five-minute Apgar score of ten.

It is somewhat alarming to us that the infants showing low Apgar scores were not all predicted to have such ratings on the basis of their fetal heart tracings prior to delivery. One can see from the tables that these infants demonstrated intermediate Apgar scores.

Patient acceptance of the technique of applying the monitor was good. All patients were monitored with thorough explanation and discussion of the reason for use of the monitor. Such preparation helped the patients adjust to the procedure. The patients who did complain of the greatest discomfort were those in which monitoring was started at a later point than 2-3 cm cervical dilation. It was with these patients that the greatest difficulty in placement of the intrauterine catheter was encountered. No women in this series noted an increase in discomfort with labor following the placement of the sensing apparatus.

Discussion

In this series of patients, 99% of the patients were monitored with relative ease. There was one failure of application of the sensing units. The technique was well accepted by the patients and has been accepted by the practicing physicians at this hospital. Most physicians prefer to reserve the use of the monitor for those patients with some abnormality which might affect the outcome of their labor.

Following the application of the monitor to the patient, it was found that labor could be monitored until the time of delivery, regardless of the length of labor. In some cases, this was a very short time, less than an hour. In others, this covered a time span of several hours, which occasionally necessitated refilling the recorder with tracing paper.

In this series of 100 patients, there was one fetal death. This particular patient, as noted previously, actually died prior to the application of the monitor and was not monitored at the time of death. This compares with an overall perinatal mortality rate at this hospital of 1.8% for the year 1969 for infants weighing 500 gm or more. The section rate in this series of patients is 4%. This compares with an overall section rate at this hospital of 2.1%. However, this series is biased with complicated cases which makes interpretation difficult. Eighty-five percent of the infants delivered in this series demonstrated a five-minute Apgar score of nine or

Pheochromocytoma: Current Management in a Community Hospital

Case Reports

Pheochromocytoma has been recognized as a distinct entity for almost 100 years,[1] yet it is rarely diagnosed.[2] Only one in ten physicians is likely to make that diagnosis during his lifetime.[3]

The association of the tumor with clinical entities in addition to hypertension, such as medullary thyroid cancer, Von Recklinghausen's disease and Von Hippel-Lindau's disease, has been recognized recently as has the familial incidence of the tumor.[4] The diagnosis and management of the patient with this tumor has been improved due to increased understanding of the various manifestations the tumor may produce in the host.[5]

Patients with this tumor can now be effectively diagnosed and treated in the community hospital.

Case Report

The patient was a 28-year-old black woman who came to the emergency room of the Missouri Delta Community Hospital complaining of severe headache for one week. She had had severe headaches for the past six years and she had noted that they were associated with sweating and a sensation of extreme heat. She had been seen in the emergency room on previous occasions, and was noted to have severe hypertension each time.

On this occasion, her blood pressure was 220/140 mm Hg. The pulse rate was 160 beats per minute, regular and she was afebrile. She was somewhat drowsy and had slurred speech. There was blurring of the optic disks. Her heart was normal except for the tachycardia. Some observers felt a small mass deep in the right flank. Laboratory studies including hemoglobin level, hematocrit reading, urinalysis, blood urea nitrogen (BUN), serum phosphorus concentration, calcium, cholesterol and blood glucose were all normal. The protein-bound iodine (PBI) was 7.5, and T-3 by column was 3.1. A spinal tap was normal. Urinary catecholamines were elevated as was the vanilmandelic acid (VMA). Chest and skull x-rays were normal. An intravenous pyelogram also was normal.

As the patient had been taking thiazide and methyldopa (Aldoril), the urinary catecholamine and VMA determinations were repeated after several days and were still elevated although less so than previously. A translumbar aortogram was performed and a large vascular tumor was demonstrated above the right kidney (Fig. 1). The patient received phenoxybenzamine hydrochloride (Dibenzyline) four days prior to surgery and was given daily transfusions of blood and Ringer's Lactate in an effort to expand her plasma volume. Through a vertical midline incision at operation, satisfactory exposure of a large right suprarenal tumor was obtained. The tumor was not manipulated until after the adrenal veins were identified and ligated. During the abdominal operation, there were two short episodes of hypertension, which were easily controlled with 2.5 mg of phentolamine (Regitine) intravenously.

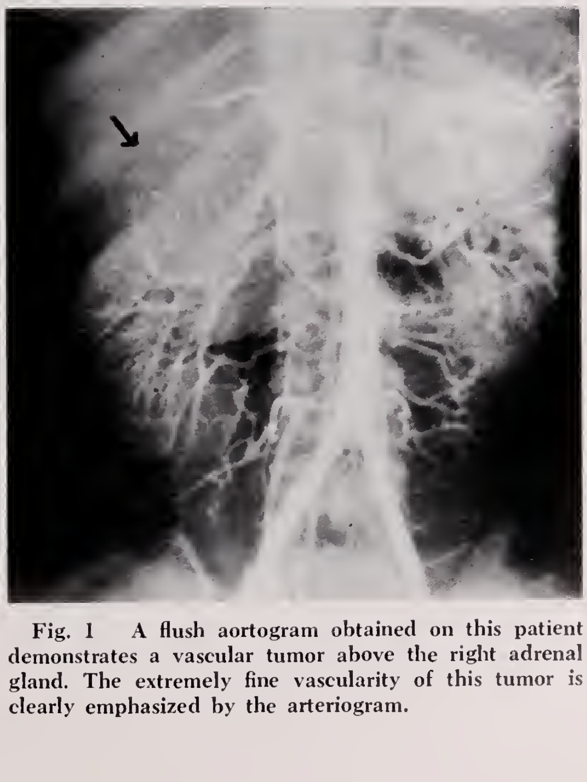

Fig. 1 A flush aortogram obtained on this patient demonstrates a vascular tumor above the right adrenal gland. The extremely fine vascularity of this tumor is clearly emphasized by the arteriogram.

Pheochromocytoma has been recognized as a distinct but rare entity. This is a report of the successful diagnosis and management of a patient with a pheochromocytoma in a community hospital. The authors discuss principals of current surgical and pre-and post-operative preparation and point out features in management and diagnosis which may be helpful to the physician away from the medical center. Mr. Felker is a fourth-year student at the University of Missouri School of Medicine who has served as an extern at the Missouri Delta Community Hospital. Dr. Critchlow is in the private practice of family medicine. Dr. Dupont is in the private practice of surgery. Dr. Ahlvin is from the Department of Pathology, Missouri Delta Community Hospital.

The specimen was an adrenal gland that weighed 65 gm (Fig. 2). It was grossly distorted due to the presence of a soft grey tumor approximately 3 cm in greatest dimension and located in the medullary portion of the gland. A thin rim of bright yellow adrenal cortical tissue was identifiable over the external surface of the tumor, and there were irregular areas of interstitial hemorrhage within the tumor. No gross necrosis was identified.

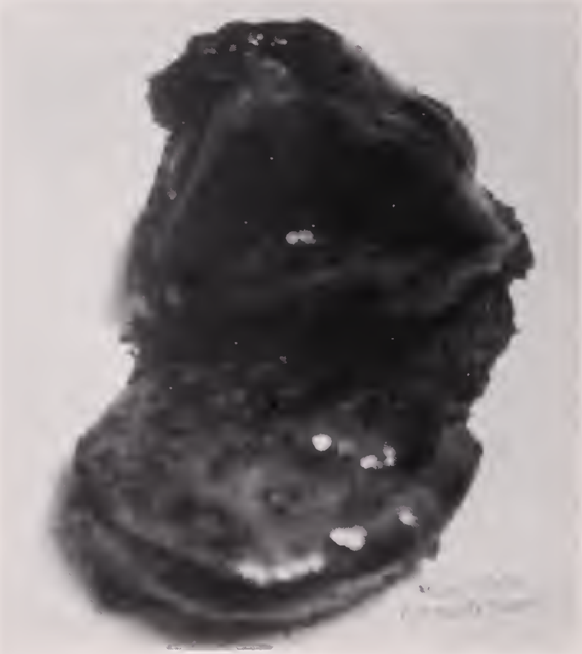

Fig. 2 The tumor itself with cut surfaces showing. The specimen weighed 65 gm and measured approximately 3 cm in greatest diameter.

Microscopically, the tumor was composed of rather large cells with abundant cytoplasm arranged in small nests separated by a delicate fibrovascular stroma. There was considerable variation in the size and shape of tumor nuclei, and there were conspicuous nucleoli. A golden brown cytoplasmic pigment was present and was best seen in portions of the tumor fixed in Zenker's fixative. A small organizing thrombus was seen in a vein within the tumor. No vascular invasion by tumor was encountered and the tumor was confined to the adrenal gland. The sections confirmed the presence of adrenal cortical tissue about the periphery of the tumor. Mitotic figures were not seen within the tumor. These gross and microscopic features were typical of a pheochromocytoma.

The patient's postoperative course was benign, and she was discharged on the eighth postoperative day and was asymptomatic and normotensive. She has remained well for the past 18 months since the operation.

Discussion

The clinical picture of hypertension, episodic flushing, diaphoresis and headache as seen in our patient should lead one to suspect a pheochromocytoma. However, the clinical manifestations are quite variable and may range from mild hypertension to hypertensive crisis.[6] The signs and symptoms are caused by the physiologically active substances, usually norepinephrines and epinephrines, produced by the tumor and released from it. The diagnosis of pheochromocytoma can be established by the identification of increased urinary catecholamines (epinephrine and norepinephrine) and their primary catabolites, VMA and metanephrines, or all of these.

Total catecholamines are measured fluorometrically in the urine and spurious elevations may be caused by medications, including adrenalin or adrenalin-like drugs; antibiotics, such as tetracyclines and quinidine; and some antihypertensive agents, particularly methyldopate hydrochloride (Aldomet). From the standpoint of laboratory methodology, VMA is preferable to the total catecholamine estimation, however, false elevations again occur with medications and foods which give rise to phenoxy acids in the urine. Coffee, fruits (especially bananas) and many drugs (including aspirin) may produce false elevations of urinary VMA. Recently, a VMA test strip has been introduced as a screening procedure.[7] The strip detects abnormal levels of VMA in urine and is extremely simple to use and very inexpensive. The experience of using the test strip as a routine screening procedure in children to detect neuroblastoma (a tumor that also may produce elevated urinary VMA) has been published and appears very gratifying.[7] The usefulness of the strip for screening hypertensive adult patients for the presence of pheochromocytoma is being evaluated at this time. Metanephrines are technically somewhat more difficult but can be measured using the method of Pisano.[8] The principal metabolic pathways of epinephrine and norepinephrine are outlined in Table 1.

The histamine test[9] and, later, the Regitine test[10] were widely used in the past. However, they both have side effects which may be severe and even life-threatening. They should be abandoned in favor of the more accurate chemical tests which carry no risk to the patient.[2, 3]

Simple x-rays are of little value in the diagnosis of abdominal pheochromocytoma.[11] Arteriography, however, is a useful tool to localize the tumor.[12] Furthermore, aortography may be of value in the differential diagnosis of hypertension when two or several causes coexist.[13] As these tumors occur in any location where chromaffin tissue is found, they may occur (and approximately 10% of them do) outside of the adrenal gland. They have been reported occurring in the neck, mediastinum, retroperitoneum and in the wall of the urinary bladder.[14] Severe hypertension may follow the injection of the contrast material; thus, the patient should be monitored carefully during the procedure and Regitine should be available in the event a hypertensive crisis occurs.

The surgical management of patients with pheochromocytoma was notoriously difficult. Marked hypertension during the surgical removal of the tumor, followed by profound shock and hypotension postoperatively, were the principal manifestations of the problems which confronted the surgeon of yesteryear. It is now felt that preoperatively, there is generalized vasoconstriction caused by the active products of the tumor, and following removal of the tumor, a profound relative hypovolemia occurs because of the absence of the previously present vasoconstriction. Current management[5, 15] calls for a gradual expansion of the blood volume over several days in the preoperative period with vasodilatation using alpha blockers, such as phenoxybenzamine hydrochloride (Dibenzyline), until a few hours before surgery. At surgery, care should be taken not to manipulate the tumor until the adrenal veins are ligated. Paroxysms of hypertension during surgery are managed with small doses of Regitine. Because of the excellent exposure, the transabdominal approach is preferred.[16] With proper preoperative preparation and careful attention to surgical technique, the postoperative period is benign and the profound hypotension, which was frequently observed following removal of a pheochromocytoma, is now rarely encountered.

TABLE 1

Norepinephrine	→	Normetanephrine	→	Excreted and/or conjugated
		↓		
		3-methoxy-4-hydroxy mandelic aldehyde	→	V M A (Vanillyl mandelic acid)
		↑		
Epinephrine	→	Metanephrine	→	Excreted and/or conjugated May be assayed in the clinical laboratory

Table 1 represents the metabolic pathways of norepinephrine and epinephrine. Both conjugated and excreted normetanephrines and metanephrines may be assayed in the clinical laboratory as may be VMA at the present time. However, the VMA is the only useful test for the smaller laboratory.

Anesthetic agents which are associated with cardiac arrhythmias should be avoided. The agents of choice may be a combination of pentothal, nitrous oxide, meperidine hydrochloride and succinylcholine.

Malignant variants of pheochromocytoma occur but are infrequent. Much more common is the presence of more than one benign pheochromocytoma in the patient. Because of the marked pheomorphism of the benign tumor, the recognition of malignancy is difficult and cannot always be done on a cytologic basis.

Summary

This is a report of the successful diagnosis and management of a patient with a pheochromocytoma in a community hospital. Principals of current surgical pre- and postoperative preparation are discussed.

Fetal Monitoring Experiences

(Continued from page 312)

better, whereas only seven demonstrated a score of five or less.

In applying the instrumentation to the infant, we questioned the effects on the infant. The electrode was of the clip type and was applied to the presenting part. The possibility of lacerations of the presenting part was a concern. However, on examination at the time of delivery, only two small puncture wounds were noted on the presenting part. At the time of the infant's discharge, usually three to four days, the puncture wounds were barely evident. This was true in all cases. There has been no morbidity associated with the application of the electrodes. In terms of the effect on the mother, two instruments were applied—the electrode as well as the intra-amniotic catheter. We found no morbidity associated with the application of either instrument. It should be noted that in one case, which is not included in the series, prolapse of the cord occurred.

SUMMARY

The findings demonstrate that the use of the monitor is practical and easily interpreted. However, one limitation is that it can be applied only with a dilated cervix. With further refinement of the techniques, we should someday be able to monitor the early phases of labor which the present method does not allow. Such devices are available, but they are subject to some artifactual problems at this time. The second limitation is that physicians are hesitant to apply the sensing units to the patients, either because they are not acquainted with the techniques involved or because they fear for discomfort to the patient. It is felt that these concerns are poorly founded in view of the possible benefits.

Due to the heavy bias of our patient group with complicated cases, it is felt at this time that the comparison of statistics with and without monitor usage are not valid. Therefore, it is not possible to offer definite conclusions as to the effect of this technique on perinatal morbidity and mortality. It is our opinion that fetal monitoring equipment is helpful and worthwhile, especially in complicated cases.

Radiologic Problem Case

A 79-YEAR-OLD WHITE MAN was admitted to the hospital for evaluation of weight loss. The patient was aware of excessive wasting which appeared to start insidiously in the past year and became most profound in the past two months. Associated with this loss of weight was difficulty in swallowing and frequent, annoying regurgitation.

Past History: There was no history that was considered contributory to the present complaint. The patient neither drank excessively nor smoked. The only previous surgical procedure was an appendectomy performed ten years prior to admission.

Physical Examination: The patient was an emaciated white man who appeared chronically ill. He was in no acute distress. His blood pressure was 108/80; respiration rate was 18 and regular. His temperature was 98 F. There was no evidence of jaundice or lymphadenopathy and there were no palpable masses noted within the abdomen. There was no tenderness noted. Except for a soft, slightly enlarged prostate, the remainder of the examination was within normal limits.

Laboratory Data: Hemoglobin level was 15 gm/100 ml; white blood cell count was 13,000 with a slight shift to the left. The SMA 12 and urinalysis were within normal limits. The EKG was normal and the VDRL was nonreactive.

Radiological Findings: An upper gastrointestinal (Figs. 1 & 2) study revealed a markedly dilated esophagus containing fluid and undigested debris. The peristaltic activity was modified and appeared ineffectual so that only a small amount of barium was propelled downward into the stomach through a narrowed lower esophageal segment. The distal end of the esophagus tapered conically with smooth and symmetrical

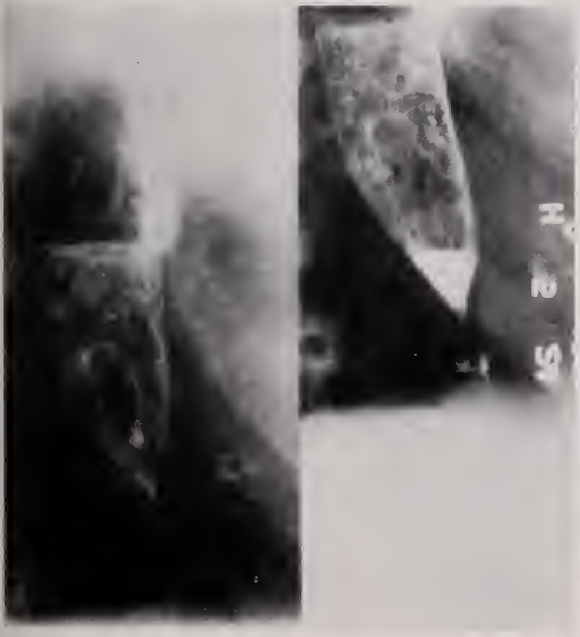

Fig. 1 Esophagus is dilated and contains fluid and ingested material.

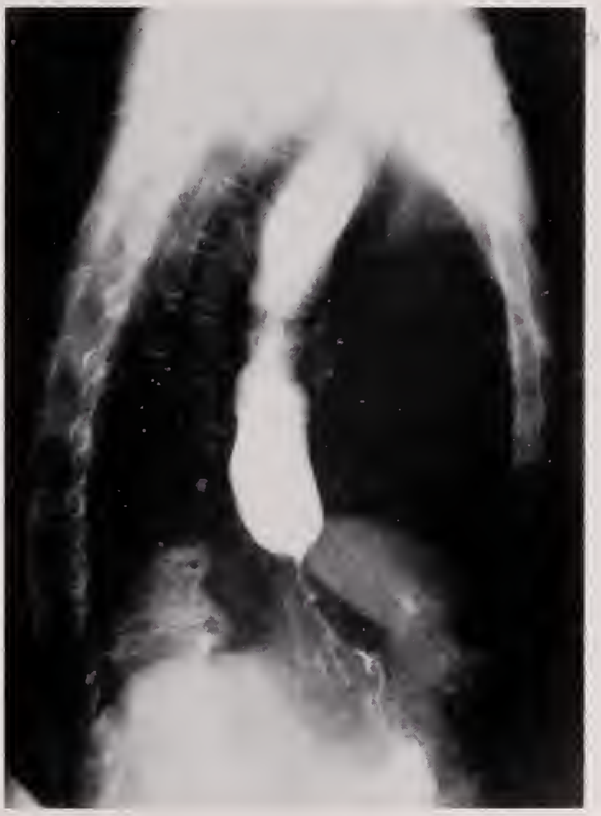

Fig. 2 Esophagus distended with barium revealing conical lower end of esophagus and cardia. There is lack of peristaltic activity exemplified in the tubular appearance of esophagus.

The authors of this series of articles presenting unusual radiologic problem cases are from the Department of Radiology, Menorah Medical Center, where Doctor Rubin is Chairman. They were assisted in this case by Hal Marshall, M.D., Pathologist, and W. H. Jacob, M.D., Radiologist.

---

sides. The marked degree of dilation and smooth, narrowed lumen suggested an achalasia. A liver scan was done and appeared normal.

Discussion

Achalasia is characterized by the absence of effective peristalsis in the body of the esophagus, failure of the gastroesophageal sphincter to relax and a characteristic hypersensitivity to cholinergic drugs. Clinically, the patient complained of a combination of symptoms such as dysphagia, regurgitation, retrosternal pain and weight loss.

The Mecholyl test has been considered a very useful aid in differentiating carcinoma from achalasia. However, this has been known to lack specificity and, thus, to fail in establishing an unequivocal diagnosis.

Cine radiographic studies and fluroscopy have been well defined in the classical pictures of achalasia and, routinely, the roentgen picture offers very little or no difficulty in establishing the diagnosis. Occasionally, however, a smooth tapered distal esophagus will be observed with symmetry of the esophageal-cardia junction that defies a correct diagnosis. Even the clinical history will not differentiate between achalasia or carcinoma since both conditions can develop rapidly. In a series of 100 cases described by Lawrence and Shoesmith,[1] 16 patients had symptoms of less than 12-months duration. The onset of the achalasia occurred preponderantly in the fourth to sixth decades of life.

Since ineffective, uncoordinated peristaltic waves have been described in achalasia, the Mecholyl test[2] had been relied upon for aiding in the differential. The intramuscular injection of this cholinergic drug, in the classical achalasia, produces a considerable increase in peristaltic activity. The barium is seen to move retrogressively toward the oral cavity, while some passes through the lower esophagus. In the main, carcinoma does not respond in a like manner to this stimulus. Recent articles have shown the limitation of this technique in making a diagnosis.[3] Manometric determinations may be an aid.[4] but in the final analysis, direct viewing of the area and a histological evaluation of the narrowed segment is essential in securing a correct diagnosis.

One should be highly suspicious of a lesion of the esophagus in the older age group, even when the appearance is characteristic of achalasia. While manometrics, the Mecholyl test and cytology offer some help to the clinician, the only pathognomonic observation is a histological study obtained by esophagoscopy and biopsy.

Endoscopic Report: Endoscopy revealed the esophagus to be filled with debris. The distal end was concentrically narrowed, inflamed, friable and resistent to distention. Biopsy was taken from the proximal end of the narrowed area (W. H. Jacobs, M.D.).

Gastroenterologist Diagnosis: Carcinoma of distal end of esophagus.

Roentgen Diagnosis: Achalasia.

Pathological Findings: Pathological examination demonstrated atypically of the epithelial cells with extreme variation and hyperchromicity consistent with a diagnosis of infiltrating, poorly-differentiated squamous cell carcinoma with extention into the underlying connective tissue (Hal Marshall, M.D.).

New Concept in Continuing Medical Education at MU-KC

The first Long Weekend, a new concept in continuing medical education, with programs designed for both the physician and his wife, will be presented on May 18-19 at the new Crown Center Hotel in Kansas City. The event is sponsored by the University of Missouri-Kansas City School of Medicine and the Division for Continuing Education, Missouri Regional Medical Program, Kansas City Southwest Clinical Society and the Academy of Health Professions.

The medical program will provide the practitioner with solid clinical knowledge useful in the practice of medicine. The format will stress involvement and participation with an emphasis on case presentations and workshops as well as indepth discussions and practical demonstrations. The sessions will cover the subjects of diabetes mellitus and thyroid disease.

The wife's program will provide opportunities for small group discussions with University faculty on the subjects of The Contemporary Woman, Poetry and Painting and the new University of Missouri-Kansas City Medical School.

Registration will be limited. For the program and registration information, contact The Long Weekend, University of Missouri-Kansas City School of Medicine, 2220 Holmes St., Kansas City, Mo. 64108 or phone 816-471-3876.

Missouri Ophthalmological Society to Meet in October

Felix N. Sabates, M.D., Kansas City, was elected president of the Missouri Ophthalmological Society at the spring meeting on March 31 at the Chase Park-Plaza Hotel in St. Louis.

The fall meeting of the Society will be held on October 19-21 at the Lodge of the Four Seasons, Lake of the Ozarks. Guest speakers will be Drs. Marshall Parks, Ephraim Friedman, Mansour Armaly and E. Grey Dimond.

For further information concerning the meeting, members are invited to contact Carl H. Ide, M.D., Secretary-Treasurer, N309 University Medical Center, Columbia 65201.

"Without your help

. . . I simply would not have made it through medical school!"

(The following letter was received on Oct. 1, 1971 from a physician who, as a student, received financial assistance from the Missouri State Medical Association members who have contributed to the Missouri State Medical Foundation. It is printed with his permission.)

Dear Doctor:

"Thank you very much for your thoughtful letter concerning receipt of my final payment on my medical student loan.

"I can well remember the feeling of destitution associated with being a reasonably good student but lacking funds with which to enroll for the next semester in medical school. Having always been, perhaps, more than adequately endowed with pride, it was a lesson in discipline and humility to go seeking financial assistance. However, the effort brought me in contact with some very nice people who really do a lot to keep one's faith in human nature alive.

"I sincerely appreciate the efforts which you and others put into the Missouri State Medical Foundation and all other student loan funds. You should feel a quiet heroism for the assistance you lend to needy students . . . without your help, I simply would not have made it through medical school."

The Missouri State Medical Foundation—MSMF—was created by the Missouri State Medical Association for the express purpose of giving financial assistance to deserving young Missourians who will be tomorrow's doctors.

The Missouri State Medical Foundation is classified by the Internal Revenue Service under Section 509(a)(3). Individuals may deduct up to 50% of their adjusted gross income for contributions made to the MSMF.

President's Message

Now that the 115th Annual Session of the MSMA is over, we can start "counting our blessings" as we get back to our daily routine of caring for the sick.

For the first time in the history of the Missouri State Medical Association, medical students were given the opportunity to participate. Eight delegates, two from each of the four medical schools in Missouri, are now eligible to vote at the state meetings. The students seemed to be very interested in the various resolutions. There was considerable diversity in their opinions, and they did not vote "en bloc." We were glad to have their participation.

E. A. Stricker, M.D.

Another unusual aspect of the program was the opening of the General Session with talks by two prominent members of Congress. Our Missouri Congressman, James W. Symington, talked about "Health as the Federal Legislative Challenge" and Dr. Tim Lee Carter, Congressman from Kentucky, spoke on "The Federal Role in Medicine." Since medical legislation seems to be the "name of the game," this session was well attended. Both speakers intimated that some form of national health insurance is in the making and probably will be passed within a year or two. The most popular version is the AMA Medicredit Bill, which has 160 sponsors. This shows that the AMA and AMPAC have been doing their homework. It behooves us to support these groups more than ever.

A relatively new AMA policy is for one member of its Board of Directors to attend each state medical convention. We had the honor of having Dr. James H. Sammons of Baytown, Tex., who is Vice-Chairman of the AMA Board of Trustees. Dr. Sammons, a graduate of St. Louis University School of Medicine, discussed the role of the AMA in medical legislation and answered questions pertaining to AMA policies. His presence at the meeting in St. Louis shows the interest of our AMA Board in trying to communicate with the "grass roots" members in order that the organization may better serve us all.

Our guest speaker at the banquet was The Honorable William C. Phelps, Lieutenant-Governor of Missouri. The present administration is interested in the development and coordination of emergency health care facilities all over the state and their accessibility to everyone. Lieutenant-Governor Phelps invited suggestions from all interested physicians.

All in all, the Annual Session was highly successful in terms of physician attendance; of varied programs offered concurrently by the specialty groups; in terms of entertainment planned by our hosts, the St. Louis and St. Louis County medical societies and their auxiliaries; and of the efficient coordinating efforts of our staff in Jefferson City.

Woman's Auxiliary

'50 JOYOUS YEARS OF SERVICE'

Fifty years of dedicated service means never having to say that you haven't devoted countless hours of thought and effort to the well-being of your fellow citizens.

Every active member of the Woman's Auxiliary to the MSMA can make that statement with pride, because the Auxiliary will celebrate its Golden Anniversary one year from now at the state convention in Kansas City. This should be an exceptionally interesting and inspiring year for each of our members.

Mrs. Charles R. Willman
President

During the past 50 years, our members have given many hours in volunteer work for the good of our communities throughout the state and should be proud of each year's accomplishments.

This Auxiliary year started with our annual Legislative Day in Jefferson City on April 11. We thank the MSMA staff for their help in making it such a memorable day. It was good to see so many of our friends interested in state government and in meeting their legislators. This is a *must*, if we are to be effective in helping our husbands.

My theme for the year, "50 Years of Joyous Service," expresses our thankfulness for all the blessings bestowed upon us. Also, "Building the Future on the Heritage of the Past" will be our main premise for encouraging continued progress and support in all areas from Health Education to Legislation, Public Affairs, MMPAC, Health Manpower, AMA-ERF and the Missouri State Medical Foundation (student loan fund).

We will continue to stress the importance of membership this year and look forward to adding many new members. I look forward to working with Mrs. George J. Lytton, President-Elect of our Auxiliary, and the MSMA Council in pursuit of our common goals, knowing that each of us can help the other.

We are all grateful to Mrs. Keith D. Jones (Ruthanne), our Immediate Past-President, for her untiring efforts on behalf of the Auxiliary. The state convention in St. Louis was outstanding from the Auxiliary's first Public Affairs Breakfast to the delightful luncheon style show in which our members modeled the fashions they had made. I, personally, am appreciative of Ruthanne's continuing interest and help in planning the coming year.

I am confident that our members will help to make ours an even better Missouri Auxiliary by supporting it through membership and by continuing to give of themselves as they have in the past.

EDITORIAL

"MR. CHAIRMAN, MEMBERS OF THE SUBCOMMITTEE, I AM DR. RUSSELL B. ROTH . . ."

Among 26,000 bills introduced into Congress in the past two years, more than 2,400 were of some medical significance. It is no small task to keep abreast of them. Certainly, no individual physician and, for that matter, no individual legislator, can hope to know much about any of them. For the legislators, it is a matter of good staff work and political trade-offs for support. For physicians, it has to be good staff work in our Washington Office, careful analysis by our Council on Legislation and spokesmanship plus politics at the decision-making level.

Obviously, the outstanding medical issue of the past two Congresses has been the subject of national health insurance. Four years ago when there was great fanfare as the Committee of 100 for National Health Insurance unveiled its masterplan for the construction of a huge medical bureaucracy and as Senator Kennedy and Congresswoman Griffiths introduced the Health Security Act, it was adopted by organized labor as its number one priority for passage. It was touted as the idea whose time had come. The question was not whether it would be enacted, but when.

But now, four years later, the Kennedy bill, and the threat it represented, is slowly dissipating. It seems worthwhile asking "why?" The bulk of practicing physicians are obviously happy that the Kennedy bill is nearly defunct, but I am not sure many of them know why. It just didn't take sick and die. It took an immense amount of concentrated effort to establish in Congress and in the country at large that the Kennedy bill was a massive mistake.

The Administration was against it, as was the private health insurance industry and the AMA. It required substantial cooperation with many meetings, hours of Congressional testimony, thousands of speeches and volumes of the written word to carry the message. It was accomplished. It cost AMA dues money to do it. It took many, many man-hours of a superb Washington staff and speeches and testimonies of a wide variety of AMA officers and spokesmen.

It was my personal opportunity—or obligation—to make dozens of speeches across the country, write over a dozen articles for publication, hold innumerable press, radio and television interviews on the subject and appear in the Senate before the Finance Committee and its separate Subcommittee on Health chaired by Senator Kennedy and in the House before the Ways and Means Committee and Representative Paul Rogers' Subcommittee on Health. Virtually every other officer of the AMA and member of the Board of Trustees, as well as a large number of Council and Committee members, were doing likewise. It is nice to feel that we have helped and that our efforts on behalf of the profession as well as the public have been successful.

As individuals, it would seem a hopeless task. But collectively and cooperatively, we can be—as we have been—a positive force in shaping the health care delivery system in this country.

In the final analysis, the AMA's voice can only be as strong as all of us, members of the profession, choose to make it. If we are to increase the AMA's effectiveness, if we are to increase its influence, we need the support of every physician.

RUSSELL B. ROTH, M.D.
President-Elect
American Medical Association

IMPROVED ACCIDENT & HEALTH PROGRAMS

The Disability Income Policy sponsored by the Missouri State Medical Association since 1943 has now been made GUARANTEED RENEWABLE and income benefits are available up to $300.00 weekly to members under age 56 subject to acceptance by the Company.

Also, the Major Hospital and Nurse Expense Program offers higher limits with increased Room & Board Benefits.

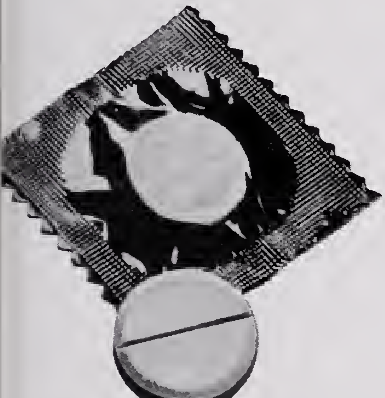
Pinworm therapy is often a family affair

Contraindications: History of hypersensitivity to thiabendazole. **Warnings:** If hypersensitivity reactions occur, drug should be discontinued immediately and not resumed. Rarely, erythema multiforme has been associated with thiabendazole therapy; in severe cases (Stevens-Johnson syndrome), fatalities have occurred. Because CNS side effects may occur quite frequently, activities requiring mental alertness should be avoided. Safe use in pregnancy or lactation has not been established. **Precautions:** Ideally, supportive therapy is indicated for anemic, dehydrated, or malnourished patients prior to initiation of anthelmintic therapy. In presence of hepatic or renal dysfunction, patients should be carefully monitored. **Adverse Reactions:** Most frequently encountered are anorexi nausea, vomiting, and dizziness. Less frequently, diarrhea, epigastric distress, pruritus, weariness, drowsiness, giddines and headache have occurred. Rarely, tinnitus, hyperirritabilit numbness, abnormal sensation in eyes, blurring of vision, xanthopsia; hypotension, collapse; enuresis; transient rise in cephalin flocculation and SGOT; perianal rash, cholestasis an parenchymal liver damage; hyperglycemia; transient leukope malodor of the urine, crystalluria, hematuria; appearance of Ascaris in the mouth and nose. Hypersensitivity reactions

Chewable Tablets 500 mg

Mintezol®

(THIABENDAZOLE | MSD)



so easy to take everyone in the family can keep to the regimen you prescribe

include: fever, facial flush, chills, conjunctival injection, angioedema, anaphylaxis, skin rashes, erythema multiforme (including Stevens-Johnson syndrome), and lymphadenopathy.
Supplied: Chewable tablets, containing 500 mg thiabendazole, in boxes of 36, strip packaged, individually foil wrapped; Suspension, containing 500 mg thiabendazole per 5 ml, in bottles of 120 ml.

For more detailed information, consult your MSD representative or see full prescribing information. Merck Sharp & Dohme, Division of Merck & Co., INC., West Point, Pa. 19486

MSD

addendum

INDICATION | DOSAGE SCHEDULE

MINTEZOL® (Thiabendazole, MSD) has demonstrated effectiveness against a broad spectrum of nematode infections. Dosages are weight related. For your convenience, the information in the weight-dose chart below is included in the full prescribing information and in the 1973 edition of PDR.
The recommended maximum daily dose of MINTEZOL is 3 g (6 tablets).
MINTEZOL should be given after meals if possible. Dietary restriction, complementary medications, and cleansing enemas are not needed.
The usual dosage schedule for all conditions is two doses per day. The size of the dose is determined by the patient's weight.

Weight-dose chart:

WEIGHT (lb)	EACH DOSE (g)	TABLETS
25	0.25	½
50	0.5	1
75	0.75	1½
100	1.0	2
125	1.25	2½
150 & over	1.5	3

The regimen for each indication follows:

INDICATION	REGIMEN	COMMENTS
Pinworm disease	Two doses per day for 1 day. Repeat in 7 days. This regimen is designed to reduce the risk of reinfection.	If this is not practical, give 2 doses per day for 2 successive days.
Threadworm,* large roundworm,* hookworm,* and whipworm* disease	Two doses per day for 2 successive days.	A single dose of 20 mg/lb or 50 mg/kg may be employed as an alternative schedule, but a higher incidence of side effects should be expected.
Creeping eruption	Two doses per day for 2 successive days.	If active lesions are still present 2 days after completion of therapy, a second course is recommended.
Symptoms of trichinosis* during the invasive phase of the disease	Two doses per day for 2 to 4 successive days according to the response of the patient.	The optimal dosage for the treatment of trichinosis has not been established.

*Clinical experience with thiabendazole for treatment of each of these conditions in children weighing less than 30 lb has been limited.

Antivert®
(meclizine HCl)
for vertigo*

:ivert® (meclizine HCl) has been found
'ul in the management of vertigo associ-
l with diseases affecting the vestibular sys-
. It is available as Antivert (12.5 mg.
:lizine HCl) and Antivert/25 (25 mg.
:lizine HCl) scored tablets for conven-
:e and flexibility of dosage. Antivert/25
mg. meclizine HCl) Chewable Tablets
available for the management of nausea,
niting, and dizziness associated with mo-
ı sickness.

NDICATIONS. Based on a review of this drug by
ıe National Academy of Sciences-National Research
Council and/or other information, FDA has classified
ıe indications as follows:

Effective: Management of nausea and vomiting and
izziness associated with motion sickness.

Possibly Effective: Management of vertigo asso-
iated with diseases affecting the vestibular system.

Final classification of the less than effective indica-
ions requires further investigation.

CONTRAINDICATIONS. Administration of Antivert during pregnancy or to women who may become pregnant is contraindicated in view of the teratogenic effect of the drug in rats.

The administration of meclizine to pregnant rats during the 12th-15th day of gestation has produced cleft palate in the offspring. Limited studies using doses of over 100 mg./kg./day in rabbits and 10 mg./kg./day in pigs and monkeys did not show cleft palate. Congeners of meclizine have caused cleft palate in species other than the rat.

Meclizine HCl is contraindicated in individuals who have shown a previous hypersensitivity to it.

WARNINGS. Since drowsiness may, on occasion, occur with use of this drug, patients should be warned of this possibility and cautioned against driving a car or operating dangerous machinery.

Usage in Children: Clinical studies establishing safety and effectiveness in children have not been done; therefore, usage is not recommended in the pediatric age group.

Usage in Pregnancy: See "Contraindications."

ADVERSE REACTIONS. Drowsiness, dry mouth and, on rare occasions, blurred vision have been reported.

LETTERS to the Editor

Dr. Joseph V. Finnegan, M.D., Editor
Missouri Medicine
515 East High St.
Jefferson City, Mo. 65101

Dear Dr. Finnegan:

I wish to comment on the editorial of Dr. Donald E. Kuenzi [Feb. 1973, Vol. 70, pg. 111]. Times are changing, but I believe most physicians remain interested in creating conditions of practice which allows them an individual relationship with their patients and a reasonable degree of personal freedom. I do not believe that most young men enter the medical profession solely for financial rewards, or even for intellectual stimulation, but that many appreciate and seek a degree of freedom and responsibility inherent with a practice. Certainly, it is these responsible, bright people that we wish to encourage to continue entering the medical profession.

I would agree with Dr. Kuenzi that working in the highly regulated situation that he describes would be an anathema to most physicians in practice today. In an economy which is otherwise subject to minimal regulations, it would discourage capable and ambitious young men from entering medical school. Unfortunately, I feel that the rigid attitude which Dr. Kuenzi appears to typify will bring about the exact situation that he so strenuously desires to avoid.

Health care is a purchasable commodity, and even in the most highly socialized countries, there are variations in the standards of health care that essentially depend upon economic factors and not entirely upon the individual's medical needs. However, most Americans, including many physicians, believe that a certain level of health care is a "right," just as they believe that no American should be allowed to die on the street of starvation. To obtusely deny that it is a "right" and to place it in the category of purchasing a television set or an automobile will only create a situation in which the most extreme regulatory controls will not only be tolerated, but demanded by the American public. Very few physicians would like to see this happen. I think a much more sensible approach would be to agree that health care is a "right," but not a right which the medical profession owes to the American public. It is a "right" which is owed to them by their government.

I would hope that we would organize ourselves to insist that the government provide the public with their rights in a manner most consistent with continuing the high standards of medical care that currently exist. Hopefully, we will be able to combine with consumer groups to insist that the government provide all Americans with a reasonable level of medical care within a framework which does not seriously infringe upon the present freedom of the practitioner of medicine.

It is not the responsibility of the medical profession to devise a solution to this serious social problem, but it is certainly their responsibility to participate in discussions leading to such a solution. Denying that health care is a "right" is denying that such a problem exists. It will not work and can only lead to imposed solutions whose major objectives will be short-term political benefits and not the continuing upgrading of health care for the American public. It is only by recognizing health care as a "right" that we can find a common base of action with important consumer groups and thus exert sufficient pressure upon the government to keep American medicine a viable and attractive profession.

Sincerely,
Arthur L. Prensky, M.D.
Associate Professor of
Pediatrics and Neurology
Washington University School of Medicine
St. Louis, Mo. 63110

ABFP Certification Examination

The American Board of Family Practice announces that it will give its next two-day written certification examination on Oct. 20-21, 1973. It will be held in various centers geographically distributed throughout the United States. Information regarding the examination can be obtained by writing to Nicholas J. Pisacano, M.D., Secretary, American Board of Family Practice, Inc., University of Kentucky Medical Center, Annex #2, Room 229, Lexington, Ky. 40506.

Please Note: It is necessary for each physician desiring to take the examination to file a completed application with the Board office. Deadline for receipt of applications in this office is *Aug. 1, 1973.*

County Society News

FIRST DISTRICT

COUNCILOR
JOHN N. MARTIN, M.D., ST. JOSEPH

Buchanan County Medical Society

A dinner and all-business meeting was held by Buchanan County Medical Society on March 7 in the Empire Room of Hotel Robidoux in St. Joseph.

Dr. E. F. Butler, President, presided at the meeting.

A request for assistance in training ambulance personnel was received from St. Joseph Hospital. The Buchanan County Trauma Committee agreed to undertake training of the ambulance personnel.

Dr. Robert W. Kieber outlined a preceptorship program for Family Practice physicians at Methodist Hospital and Medical Center. The Society voted to endorse a proposed home rule county charter to be placed before Buchanan County voters on March 20.

Mrs. William B. O'Connor, Doctors Day Chairman for the Auxiliary, sent a letter advising the Society that in its honor, the Auxiliary had made more than $1,200 in contributions to the Missouri State Medical Foundation, AMA-ERF and the Medical Library at Missouri Western College.

The Society noted with pleasure that Mrs. Charles R. Willman would be installed as President of the Woman's Auxiliary to the Missouri State Medical Association at the annual session in St. Louis on March 29-April 1.

Mrs. E. F. Butler, Past-President of the MSMA Auxiliary, will be her installing officer.

G. Tyson Carpenter, M.D., *Secretary*

SECOND DISTRICT

COUNCILOR
LYSLE M. BACH, M.D., HANNIBAL

Chariton-Macon-Monroe-Randolph County Medical Society

The regular monthly meeting of Chariton-Macon-Monroe-Randolph County Medical Society was held in the library of Woodland Hospital in Moberly on March 8.

Members present were Drs. F. L. Harms, D. D. Stuart, J. E. Campbell, D. E. Eggleston, F. A. Barnett, J. Baker, W. D. Chute, C. C. Cohrs, P. V. Dreyer, J. W. Fleming, Jr., T. S. Fleming, L. E. Huber, R. V. Tompson and R. H. Young.

Minutes of the previous meeting were read and approved. Dr. Cohrs explained the proposed resolution to the MSMA concerning the recently formed Board of Allergy and the resolution was approved unanimously. The Secretary forwarded information on the Medical Center Spring Clinic to be held in May at the Medical Center and, also, two Blue Shield Board vacancies for the year from this district.

The program was presented by Dr. Larry Henry, Columbia, a pathologist. His subject was "Forensic Pathology." He outlined the basic differences between a medical examiner system and a coroner system and then showed several case presentations to illustrate the role of forensic pathology in differentiating between accidental and homicidal deaths. He also pointed out various unusual causes of death.

Dr. Henry is one of three trained forensic pathologists practicing in the state of Missouri.

Robert V. Tompson, M.D., *Secretary*

EIGHTH DISTRICT

COUNCILOR
HOWARD J. McALHANY, M.D.,
SPRINGFIELD

Jasper County Medical Society

Dr. William D. Mayer, dean of the University of Missouri School of Medicine and director of the University Medical Center, was the guest speaker at the dinner meeting of Jasper County Medical Society at the Twin Hills Golf and Country Club in Joplin on March 13.

Dr. Mayer presented a program on changes in health care at the University and on referral practices.

In addition to Dr. Mayer, Dr. William C. Allen, Associate Professor of Community Health and Medical Practices at the University of Missouri Medical Center, spoke on "Hospital Affiliations" and Dr. Paul R. Young, Medical Director for Continuing Medical Education at the University, discussed "Medical Sabbaticals for Practicing Physicians."

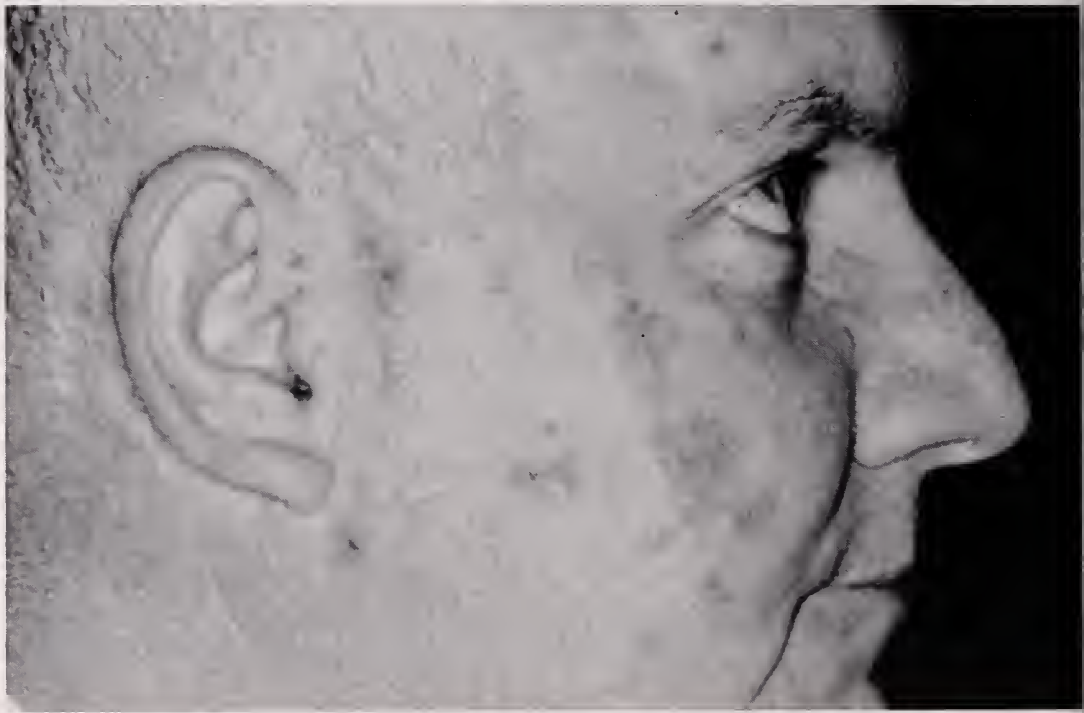
Dr. Howard B. McAlhany, Eighth District Councilor, informed Society members of the 1973 MSMA Annual Session plans.

Howard H. Roberts, M.D., *Secretary*

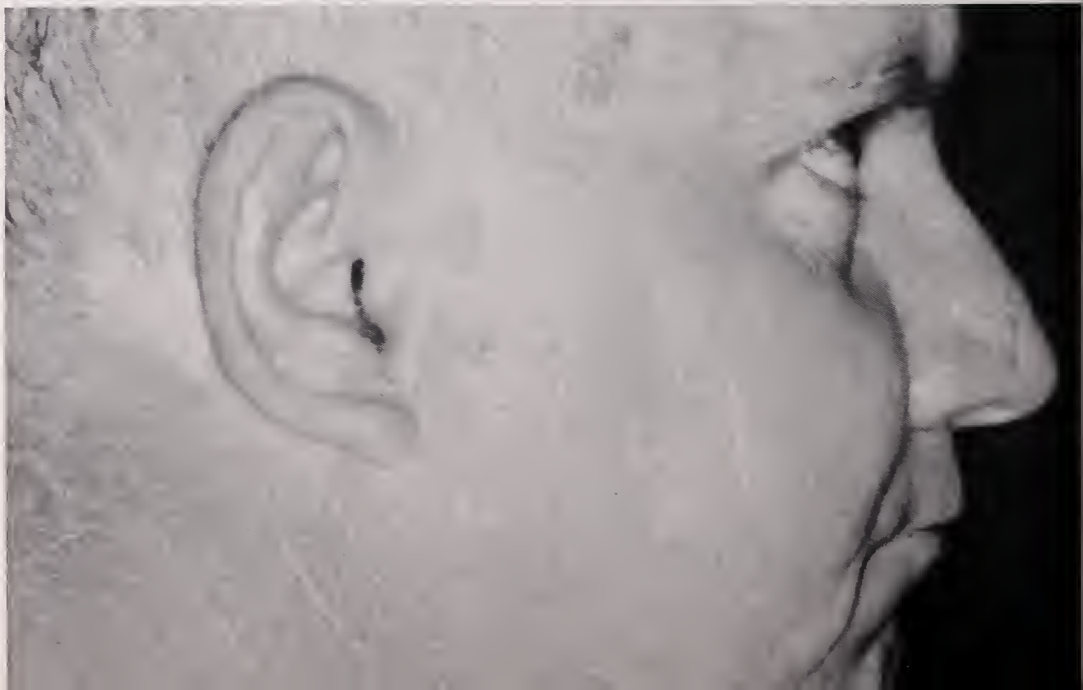
What's on your patient's face...

may be more important than his chief complaint

Patient P.T.* seen on 3/29/67 shows typical lesions of moderately severe keratoses. Note residual scarring on ridge of nose from previous cryosurgical and electrosurgical procedures.



Patient P.T.* seen on 6/12/67, seven weeks after discontinuation of 5% FU cream. Reaction has subsided. Residual scarring not seen except that due to prior surgery. Inflammation has cleared and face is clear of keratotic lesions.



*Data on file, Hoffmann-La Roche Inc., Nutley, N.J

he lesions on his face re solar/actinic— o-called “senile” keratoses... nd they may be premalignant.

lar, actinic or senile keratoses

se lesions may be called by several names, but they
ally can be identified by the following characteris-
. The typical lesion is flat or slightly elevated, of a
wnish or reddish color, papular, dry, rough, adherent
l sharply defined. They commonly occur as multiple
ions, chiefly on the exposed portions of the skin.

quence of therapy— lectivity of response

er several days of therapy with Efudex® (fluorouracil),
thema may begin to appear in the area of the lesions;
s reaction usually reaches its height of unsightliness
l discomfort within two weeks, declining after dis-
tinuation of therapy. This reaction occurs in affected
as. Since the response is so predictable, lesions that
not respond should be biopsied.

cceptable results

atment with Efudex provides highly favorable cos-
tic results. Incidence of scarring is low. This is par-
ularly important with multiple facial lesions. Efudex
uld be applied with care near the eyes, nose and mouth.

Before prescribing, please consult complete product information, a summary of which follows:

Indications: Multiple actinic or solar keratoses.

Contraindications: Patients with known hypersensitivity to any of its components.

Warnings: If occlusive dressing used, may increase inflammatory reactions in adjacent normal skin. Avoid prolonged exposure to ultraviolet rays. Safe use in pregnancy not established.

Precautions: If applied with fingers, wash hands immediately. Apply with care near eyes, nose and mouth. Lesions failing to respond or recurring should be biopsied.

Adverse Reactions: Local—pain, pruritus, hyperpigmentation and burning at application site most frequent; also dermatitis, scarring, soreness and tenderness. Also reported—insomnia, stomatitis, suppuration, scaling, swelling, irritability, medicinal taste, photosensitivity, lacrimation, leukocytosis, thrombocytopenia, toxic granulation and eosinophilia.

Dosage and Administration: Apply sufficient quantity to cover lesion twice daily with nonmetal applicator or suitable glove. Usual duration of therapy is 2 to 4 weeks.

How Supplied: Solution, 10-ml drop dispensers—containing 2% or 5% fluorouracil on a weight/weight basis, compounded with propylene glycol, tris(hydroxymethyl)-aminomethane, hydroxypropyl cellulose, parabens (methyl and propyl) and disodium edetate.

Cream, 25-Gm tubes—containing 5% fluorouracil in a vanishing cream base consisting of white petrolatum, stearyl alcohol, propylene glycol, polysorbate 60 and parabens (methyl and propyl).

Lata R. Bagwe, M.D., 1056 Willowbrook Dr., St. Louis, has become a member of St. Louis County Medical Society. Dr. Bagwe is a native of Barada, India, received his M.D. degree at Barado Medical College in 1964. He specializes in obstetrics and gynecology.

Ronald G. Benson, M.D., 900 E. Cherry, Springfield, has become a member of Greene County Medical Society. Dr. Benson is a native of Jefferson City, received his preliminary education at Westminster College and his M.D. degree at the University of Missouri in 1966. He specializes in obstetrics and gynecology.

Charles A. Clough, M.D., 4320 Wornall Rd., Kansas City, has become a member of Jackson County Medical Society. Dr. Clough is a native of Oklahoma City, Okla., received his preliminary education at the University of Oklahoma and his M.D. degree at the University of Oklahoma in 1959. He specializes in neurological surgery.

LeRoy J. Dierker, M.D., Cricklewood Pl., St. Louis, has become a member of St. Louis County Medical Society. Dr. Dierker is a native of Lawrence, Neb., received his preliminary education at St. Louis University and his M.D. degree at St. Louis University in 1942. He specializes in anesthesiology.

Reinhold Engleman, M.D., 1002 Walnut, Kansas City, has become a member of Jackson County Medical Society. Dr. Engleman is a native of Indiana, received his preliminary education at Indiana State University and his M.D. degree at Washington University in 1943. He specializes in insurance medicine.

Jack Maurice Gniwesch, M.D., 8679 Spoon Dr., St. Louis, has become a member of St. Louis County Medical Society. Dr. Gniwesch is a native of Belgium, received his preliminary education at Rabbinical Seminary and his M.D. degree at St. Louis University in 1968. He specializes in general surgery.

Oscar Hantz, M.D., 1125 Graham Rd., Florissant, has become a member of St. Louis County Medical Society. Dr. Hantz is a native of Argentina, received his preliminary education at Colegio Menserrat and his M.D. degree at Cordoba University in 1961. He specializes in otorhinolaryngology.

Bruce J. Hookerman, M.D., 1207 Oxford Hill Court, St. Louis, has become a member of St. Louis County Medical Society. Dr. Hookerman is a native of Philadelphia, Pa., received his preliminary education at Dartmouth College and his M.D. degree at St. Louis University in 1968. He specializes in dermatology.

Richard D. McLaughlin, M.D., 117 Professional Bldg., Springfield, has become a member of Greene County Medical Society. Dr. McLaughlin is a native of Iowa, received his preliminary education at Kansas State University and his M.D. degree at Kansas University in 1965. He specializes in obstetrics and gynecology.

Jose Navato, M.D., 938 Brookvale Terr., Manchester, has become a member of Jefferson County Medical Society. Dr. Navato is a native of the Philippines, received his preliminary education at the University of the Philippines and his M.D. degree at the University of the Philippines in 1955. He specializes in psychiatry and is in general practice.

David L. Ohlms, M.D., 35 N. Central, St. Louis, has become a member of St. Louis County Medical Society. Dr. Ohlms is a native of St. Charles, received his preliminary education at St. Mary's University and his M.D. degree at the University of Texas in 1968. He specializes in psychiatry.

Agatha Lee Park, M.D., 111 Church St., St. Louis, has become a member of St. Louis County Medical Society. Dr. Park is a native of Seoul, Korea, received her preliminary education at Yonsei University and her M.D. degree at Severance Medical College Yonsei University in 1963. She specializes in dermatology.

James Milton Pickens, M.D., 807 Stadium Dr., Columbia, has become a member of Boone County Medical Society. Dr. Pickens is a native of Texas, received his preliminary education at the University of Texas and his M.D. degree at the University of Texas in 1956. He specializes in pediatrics and neurology.

Antonio S. Racela, Jr., M.D., Linwood Blvd. at Prospect, Kansas City, has become a member of Jackson County Medical Society. Dr. Racela is a native of the Philippines, received his preliminary education at the University of the Philippines and his M.D. degree at the University of the Philippines in 1963. He specializes in pathology.

William A. Shipley, M.D., 807 Stadium, Columbia, has become a member of Boone County Medical Society. Dr. Shipley is a native of St. Louis, received his preliminary education at Southern Illinois University and his M.D. degree at the University of Iowa in 1967. He specializes in radiology.

Gritte Supattanasiri, M.D., 128 W. Russell, Ironton, has become a member of Mineral Area County Medical Society. Dr. Supattanasiri is a native of China, received his preliminary education at Pre-Medical Science and his M.D. degree at Chieng Mai in 1964. He specializes in general surgery.

William Louis Traxel, M.D., 623 Pine Blvd., Poplar Bluff, has become a member of Butler-Wayne-Ripley County Medical Society. Dr. Traxel is a native of Maysville, Ky., received his preliminary education at Northwestern University and his M.D. degree at Vanderbilt University in 1965. He specializes in ophthalmology.

D. K. Varma, M.D., 215 Oak, Poplar Bluff, has become a member of Butler-Wayne-Ripley County Medical Society. Dr. Varma is a native of India and received his preliminary education at K. P. College and his M.D. degree at Nagpur University in 1955. He specializes in internal medicine and pulmonary disease.

Jasper Wakeman, Jr., M.D., 406 Professional Bldg., Springfield, has become a member of Greene County Medical Society. Dr. Wakeman is a native of Springfield, received his preliminary education at the University of Missouri and his M.D. degree at the University of Missouri in 1964. He specializes in orthopedic surgery.

Arlen D. Winsky, M.D., 226 Professional Bldg., Springfield, has become a member of Greene County Medical Society. Dr. Winsky is a native of Newton, Kan., received his preliminary education at Bethel College and his M.D. degree at the University of Kansas in 1963. He specializes in plastic surgery.

Dolores P. Wolff, M.D., #3 Tuscany Park, St. Louis, has become a member of St. Louis County Medical Society. Dr. Wolff is a native of St. Louis, received her preliminary education at Washington University and her M.D. degree at Washington University in 1959. She specializes in anesthesiology.

Thomas Owen Woods, M.D., 621 Pine, Poplar Bluff, has become a member of Butler-Wayne-Ripley County Medical Society. Dr. Woods is a native of Parkin, Ark., received his preliminary education at Centenary College of Louisiana and his M.D. degree at the University of Arkansas in 1966. He is in general practice.

Missouri Medicine in Review

FORTY YEARS AGO

The 76th Annual Meeting of the Missouri State Medical Association will convene on May 1-4 in Kansas City with all sessions and headquarters at the President Hotel. Four guest speakers will deliver addresses at the session. Each is well versed in his specialty and a recognized authority. The speakers are Dr. Charles A. Elliott, Chicago, Professor of Medicine, Northwestern University Medical School; Dr. Peter C. Kronfeld, Chicago, Associate Professor of Ophthalmology, Graduate School of Medicine of the Division of the Biological Sciences, University of Chicago; Dr. J. Gordon Wilson, Chicago, Professor of Otology and Laryngology, Northwestern University Medical School; and Dr. Arnold S. Jackson, Madison, Wis., a member of the Jackson Clinic and attending surgeon at the Methodist Hospital.

Although the Legislature is still in session as we go to press, we can announce the disposition of some of the bills we supported or opposed. The principal measure that we supported was HB 282, a lien law for physicians and hospitals. The bill passed the House with a good majority, but struck an unanticipated snag in the Senate. The opposition, it is said, emanated from insurance companies and a certain class of attorneys. Toward the close of the session, an important measure was passed which removed all restrictions on the prescribing of alcoholic liquors by licensed physicians. This is HB 664, which makes it lawful for any reputable physician to prescribe alcoholic liquor in such quantities and with such frequency and dosages as, in his judgement, the needs of his patient may require.

In the Oct. 15, 1932 issue of the *Journal of the AMA*, Burrill B. Crohn, Leon Ginzburg and Gordon D. Oppenheimer, New York, describe, in its pathologic and clinical details, a disease of the terminal ileum affecting mainly young adults, characterized by a subacute or chronic necrotizing and cicatrizing inflammation. The disease is clinically featured by symptoms that resemble those of ulcerative colitis, namely, fever, diarrhea and emaciation, leading eventually to an obstruction of the small intestine. The constant occurrence of a mass in the right iliac fossa usually requires surgical intervention (resection). The terminal ileum is involved alone. The etiology of the process is unknown; it belongs to none of the categories of recognized granulomatous or accepted inflammatory groups. The course is relatively benign, all the patients who survive operation being alive and well.

TWENTY-FIVE YEARS AGO

Wallis Smith, M.D., Springfield, was elected President-Elect of the Missouri State Medical Association at its 90th Annual Session in St. Louis on March 14-17. He will serve in his present capacity until the next Annual Session when he will be installed as President.

Dr. Smith brings to his new office much ability and experience in organized medicine. He has served the Association and the Greene County Medical Society throughout his years in the practice of medicine and many times has proved his unfaltering interest in the betterment of medical practice and the health of the people. Dr. Smith was graduated from Drury College in Springfield in 1908 after which he entered Rush Medical College, which was affiliated with the University of Chicago at that time.

Drew Luten, M.D., St. Louis, was elected president of the Missouri Branch of the American Heart Association at a meeting on March 16. Other officers elected are A. Graham Asher, M.D., Kansas City, vice-president and C. Braxton Davis, Nevada, secretary.

Between July 18, 1947 and Jan. 1, 1948, 15,600 veterans have been examined or treated by "hometown physicians," who received $242,700 from the Veterans Administration. "There were no complaints and no charges of any kind against any physicians in the state of Missouri." This is on the authority of a "top-drawer" representative of the Veterans Administration.

The Carter-Shannon County Medical Society met in the Hyde Building in Eminence on Feb-

Spasm reactor?
Donnatal®!

2 ways to provide a daily therapeutic supply of Vitamin C: 15 baked potatoes (skins and all!) or one capsule of Allbee® with C

About 20 mg. Vitamin C in one baked potato (2½″ diameter).

Allbee® with C
MULTIVITAMINS
Each capsule contains: % MDR
Thiamine mononitrate (B_1) 15 mg 1500%
Riboflavin (B_2) 10 mg 834%
Pyridoxine hydrochloride (B_6) 5 mg *
Niacinamide 50 mg 500%
Calcium pantothenate 10 mg **
Ascorbic acid (Vitamin C) 300 mg 1000%
30 CAPSULES
A·H·ROBINS
AHR
AHR

To many people the evening meal just isn't complete without potatoes. But your patient would have to eat 15 of them (skins and all!) to get as much Vitamin C as is contained in just one Allbee with C capsule taken daily. A bottle of 30 (month's therapeutic dose) supplies as much ascorbic acid as 450 potatoes, plus full therapeutic amounts of the B-complex vitamins. For the patient who is counting calories, Allbee with C is small potatoes because the B's and C are water soluble. Consider the number of calories in 15 potatoes, not to mention the mountain of butter and sour cream. Albee with C is available at pharmacies in the handy bottle of 30 and the economy size of 100 on your prescription or recommendation.

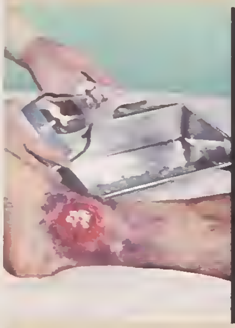
Travase® Ointment brand of Sutilains

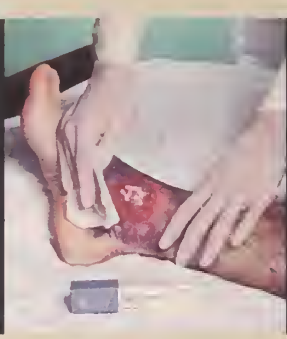
APPLICATION TECHNIQUE: TRAVASE Ointment is indicated as an adjunct to established methods of wound care for biochemical debridement. It dissolves and facilitates the removal of necrotic tissues and purulent exudates.

TRAVASE enzymes are selective. Virtually inactive on viable tissue.

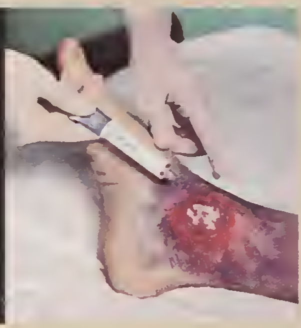
When this recommended nursing technique is followed without déviation, this procedure can generate visible improvement within 48 hours . . .



Jlcer being irrigated) horoughly cleanse and rigate the wound area using nly sterile water or sodium hloride solution. Be sure to leanse the wound of any ntiseptics or heavy-metal ntibacterial agents which iay interfere with the nzyme activity.



Thoroughly soak the wound area. Where practical, tubbing or showering is suitable. Or wet soaks with gauze pads may be used. Remember to avoid chemical cleansing agents which may interfere with the therapy.



With a sterile cotton swab or finger cot, apply a very thin layer of TRAVASE Ointment. The ointment spreads easily and only a small amount is needed (a small dab of ointment will cover an area as big as the back of a hand).

Be sure, though, to rub the ointment well into every crack or crevice of the wound and overlap the surrounding skin one-fourth to one-half inch beyond the area to be debrided—to be sure of complete coverage.

\pply loose, wet dressings, horoughly soaked in sodium :hloride solution or sterile vater to the area to be lebrided only.

Cover the moist dressings with an occlusive wrap (Saran wrap, Telfa Pads, or other plastic wrappings) to keep wound site moist. Do not extend occlusive wrap over ½ inch beyond area to be debrided.

When changing dressing, gently wipe away the dissolved material. Repeat the complete dressing procedure, including application of TRAVASE Ointment, four times daily.

The ulcer shown in these photos is simulated on a model in order to demonstrate he correct TRAVASE application technique.

______ Additional Information on TRAVASE® Ointment (brand of Sutilains)

______ In-service training program

______ Comment ______________________________

DESCRIPTION: TRAVASE® (brand of sutilains) Ointment is a s preparation of proteolytic enzymes, elaborated by **Bacillus subt** hydrophobic ointment base consisting of 95% white petrolatum polyethylene. One gram of ointment contains approximately 82, units* of proteolytic activity.

ACTION: TRAVASE Ointment selectively digests necrotic soft ti proteolytic action. It dissolves and facilitates the removal of ne tissues and purulent exudates that otherwise impair formation granulation tissue and delay wound healing (4).

At body temperatures these proteolytic enzymes have optimal the pH range from 6.0 to 6.8.

INDICATIONS: For wound debridement (1,2)—TRAVASE Ointm indicated as an adjunct to established methods of wound care biochemical debridement of the following lesions:

Second and third degree burns,
Decubitus ulcers,
Incisional, traumatic, and pyogenic wounds,
Ulcers secondary to peripheral vascular disease.

CONTRAINDICATIONS: Application of TRAVASE (brand of suti Ointment is contraindicated in the following conditions:

Wounds communicating with major body cavities,

Wounds containing exposed major nerves or nervous tissu

Fungating neoplastic ulcers,

Wounds in women of child-bearing potential—because of l laboratory evidence of effects of TRAVASE upon the deve

WARNING: Do not permit TRAVASE Ointment to come into co the eyes. In treatment of burns or lesions about the head or n the ointment inadvertently come into contact with the eyes, th be immediately rinsed with copious amounts of water, preferat

PRECAUTIONS: A moist environment is essential to optimal ac enzyme. Enzyme activity may also be impaired by certain ager several detergents and antiseptics (benzalkonium chloride, hexachlorophene, iodine, and nitrofurazone) may render the s indifferent to the action of the enzyme (3). Compounds such a containing metallic ions interfere directly with enzyme activity slight degree, whereas neomycin, sulfamylon-streptomycin, an do not affect enzyme activity. In cases where adjunctive topic has been used and no dissolution of slough occurs after treat TRAVASE Ointment for 24 to 48 hours, further application, bec interference by the adjunctive agents, is unlikely to be reward

In cases where there is existent or threatening invasive infect appropriate systemic antibiotic therapy should be instituted cc

Although there have been no reports of systemic allergic reac humans, studies have shown that there may be an antibody re humans to absorbed enzyme material.

ADVERSE REACTIONS: Adverse reactions consist of mild, tra paresthesias, bleeding and transient dermatitis. Pain usually c controlled by administration of mild analgesics. Side effects s enough to warrant discontinuation of therapy occasionally hav

If bleeding or dermatitis occurs as a result of the application (brand of sutilains) Ointment, therapy should be discontinued. toxicity has been observed as a result of the topical applicati TRAVASE Ointment.

Dosage and Administration

STRICT ADHERENCE TO THE FOLLOWING IS REQUIRED FO RESULTS OF TREATMENT

1. Thoroughly Cleanse and Irrigate Wound Area with so or water solutions. Wound **MUST** be cleansed of anti heavy-metal antibacterials which may denature enzym substrate characteristics (e.g., Hexachlorophene, Silv Benzalkonium Chloride, Nitrofurazone, etc.).
2. Thoroughly moisten wound area either through tubbi or wet soaks (e.g., sodium chloride or water solution
3. Apply TRAVASE Ointment in a thin layer assuring int with necrotic tissue and complete wound coverage e ¼ to ½ inch beyond the area to be debrided.
4. Apply loose wet dressings.
5. Repeat entire procedure 3 to 4 times per day for bes

How Supplied

3P3002 TRAVASE Ointment is supplied sterile in one-half o (14.2 g.) containing 82,000 casein units of sutilains hydrophobic ointment base.

The ointment must be stored under refrigeration at 2° to 10° (35° to 50° F).

Methods of Diagnosis by Logan Clendening, M.D., late Professor of Clinical Medicine and History of Medicine, University of Kansas School of Medicine, and Edward H. Hashinger, M.D., Professor of Clinical Medicine, University of Kansas School of Medicine. With 143 illustrations. The C. V. Mosby Company, St. Louis, 1947. Price, $12.50.

TEN YEARS AGO

The House of Delegates at the 105th Annual Session of the MSMA elected Leonard T. Furlow, M.D., St. Louis, as President-Elect. He will be installed as President at the annual meeting in St. Louis in the spring of 1964.

Kenneth C. Hollweg, M.D., Kansas City, was installed as President.

Dr. Furlow has been a member of the MSMA since 1934 and has served on its Council as both a member and as Chairman (1962). He also is president of the Missouri State Medical Foundation.

In 1932, Dr. Furlow accepted a fellowship in neurological surgery with Dr. Ernest Sachs at Barnes Hospital. Upon completion of his training, he became associated with Dr. Sachs in the practice of neurological surgery and has advanced to the position of Associate Professor of Clinical Neurological Surgery at Washington University School of Medicine and Barnes Hospital.

Other officers elected were Drs. John I. Matthews, Jefferson City, Secretary and Charles R. Doyle, St. Louis, Treasurer. Drs. M. K. Underwood of Rolla, Carl R. Ferris of Kansas City and Paul F. Max of St. Louis were elected as Vice-Presidents.

The 15th Annual Scientific Assembly of the American Academy of General Practice is now history. This outstanding affair was held at McCormick Place in Chicago on April 1-4, 1963 with the Congress of Delegates meeting at the Palmer House on March 30-April 1. As might be expected and probably was, the attendance did not match that of the 1962 session held in that intriguing spot known as Las Vegas. However, this 15th Annual Meeting will be remembered as one of the outstanding annual sessions to date. A number of important decisions were reached by the Congress of Delegates, one of which included the rejection of the creation of a Board of General Practice.

Ye Editor notes the following in his "40 Years Ago" column:

"With the completion and occupancy on March 1 of the modern and beautiful new St. Luke's Hospital in Kansas City, Mo., the institution and organization enter upon a new and promising era. Historically, the hospital is 25 years old, having its origin under the sponsorship of the late Bishop Edward R. Atwill, Dr. Herman E. Pearse and Miss Elanore Keeley, who was the first superintendent. The prices and fees for beds and service rendered have been standardized and made to meet the needs and ability to pay of all classes. Beds in the larger wards are $2.50 per day; in the two-bed wards, $4. The private rooms vary in price from $5 to $15 per day, the latter being suites of bedroom, sitting room, special bath, toilet and closet."

How strong must a tranquilizer be for severe anxiety?

As strong as Librium® 25 mg

(chlordiazepoxide HCl)

The achievement of desired therapeutic results is often a function of the dosage *strength* as well as the drug's intrinsic action. Thus, when anxiety is *severe*, the 25-mg strength of Librium frequently provides the necessary antianxiety action with a minimum of unwanted adverse-reactions. Librium 25 mg is a convenient dosage form for the relief of severe, incapacitating anxiety, specifically formulated to supplement your counsel and reassurance.

Benefits-to-risks ratio permits higher dosage

For over 13 years, Librium has been recognized for its excellent benefits-to-risks ratio, an asset in the *higher* dosage ranges as in more common clinical applications. Thus, the frequency of dosage with Librium 25 mg can be flexibly adjusted to the needs and response of the individual patient, up to 100 mg daily if required. Total daily dosage for the elderly and debilitated should not exceed 20 mg. When severe anxiety has been reduced, Librium dosage should be correspondingly reduced or discontinued entirely.

basic support in severe anxiety

Librium® 25 mg

(chlordiazepoxide HCl)

1 capsule t.i.d./q.i.d.

ROCHE
Roche Laboratories

Before prescribing, please
plete product information, a sum
which follows:

Indications: Relief of anxiet
occurring alone or accompanying v
states.

Contraindications: Patients
hypersensitivity to the drug.

Warnings: Caution patients
combined effects with alcohol and
depressants. As with all CNS-actin
patients against hazardous occupat
complete mental alertness (*e.g.*, op
ery, driving). Though physical and
dependence have rarely been repo
mended doses, use caution in adm
addiction-prone individuals or th
increase dosage; withdrawal symp
convulsions), following discontin
drug and similar to those seen wit
have been reported. Use of any dr
lactation, or in women of childbearing age req
that its potential benefits be weighed against i
possible hazards.

Precautions: In the elderly and debilita
and in children over six, limit to smallest effec
tive dosage (initially 10 mg or less per day) to
preclude ataxia or oversedation, increasing gr
ally as needed and tolerated. Not recommend
in children under six. Though generally not r
ommended, if combination therapy with othe
psychotropics seems indicated, carefully consi
individual pharmacologic effects, particularly
use of potentiating drugs such as MAO inhib
and phenothiazines. Observe usual precautio
presence of impaired renal or hepatic functio
Paradoxical reactions (*e.g.*, excitement, stimul
and acute rage) have been reported in psychia
patients and hyperactive aggressive children.
Employ usual precautions in treatment of an
states with evidence of impending depression
suicidal tendencies may be present and protec
measures necessary. Variable effects on blood
coagulation have been reported very rarely i
patients receiving the drug and oral anticoag
lants; causal relationship has not been establi
clinically.

Adverse Reactions: Drowsiness, ataxia
confusion may occur, especially in the elderly
debilitated. These are reversible in most insta
by proper dosage adjustment, but are also occ
sionally observed at the lower dosage ranges.
few instances syncope has been reported. Als
countered are isolated instances of skin erupt
edema, minor menstrual irregularities, nause
constipation, extrapyramidal symptoms, incr
and decreased libido—all infrequent and gen
controlled with dosage reduction; changes in
patterns (low-voltage fast activity) may appe
during and after treatment; blood dyscrasias
cluding agranulocytosis), jaundice and hepat
dysfunction have been reported occasionally,
ing periodic blood counts and liver function
advisable during protracted therapy.

Supplied: Librium® Capsules contain
5 mg, 10 mg or 25 mg chlordiazepoxide HC
Libritabs® Tablets containing 5 mg, 10 mg o
25 mg chlordiazepoxide.

ROCHE
Roche Laboratories
Division of Hoffmann-La Roche Inc.
Nutley, N.J. 07110

Before prescribing, please consult complete product information, a summary of which follows:

Indications: Tension and anxiety states; somatic complaints which are concomitants of emotional factors; psychoneurotic states manifested by tension, anxiety, apprehension, fatigue, depressive symptoms or agitation; symptomatic relief of acute agitation, tremor, delirium tremens and hallucinosis due to acute alcohol withdrawal; adjunctively in skeletal muscle spasm due to reflex spasm to local pathology, spasticity caused by upper motor neuron disorders, athetosis, stiff-man syndrome, convulsive disorders (not for sole therapy).

Contraindicated: Known hypersensitivity to the drug. Children under 6 months of age. Acute narrow angle glaucoma; may be used in patients with open angle glaucoma who are receiving appropriate therapy.

Warnings: Not of value in psychotic patients. Caution against hazardous occupations requiring complete mental alertness. When used adjunctively in convulsive disorders, possibility of increase in frequency and/or severity of grand mal seizures may require increased dosage of standard anticonvulsant medication; abrupt withdrawal may be associated with temporary increase in frequency and/or severity of seizures. Advise against simultaneous ingestion of alcohol and other CNS depressants. Withdrawal symptoms (similar to those with barbiturates and alcohol) have occurred following abrupt discontinuance (convulsions, tremor, abdominal and muscle cramps, vomiting and sweating). Keep addiction-prone individuals under careful surveillance because of their predisposition to habituation and dependence. In pregnancy, lactation or women of childbearing age, weigh potential benefit against possible hazard.

Precautions: If combined with other psychotropics or anticonvulsants, consider carefully pharmacology of agents employed; drugs such as phenothiazines, narcotics, barbiturates, MAO inhibitors and other antidepressants may potentiate its action. Usual precautions indicated in patients severely depressed, or with latent depression, or with suicidal tendencies. Observe usual precautions in impaired renal or hepatic function. Limit dosage to smallest effective amount in elderly and debilitated to preclude ataxia or oversedation.

Side Effects: Drowsiness, confusion, diplopia, hypotension, changes in libido, nausea, fatigue, depression, dysarthria, jaundice, skin rash, ataxia, constipation, headache, incontinence, changes in salivation, slurred speech, tremor, vertigo, urinary retention, blurred vision. Paradoxical reactions such as acute hyperexcited states, anxiety, hallucinations, increased muscle spasticity, insomnia, rage, sleep disturbances, stimulation have been reported; should these occur, discontinue drug. Isolated reports of neutropenia, jaundice; periodic blood counts and liver function tests advisable during long-term therapy.

Dosage: Individualize for maximum beneficial effect. *Adults:* Tension, anxiety and psychoneurotic states, 2 to 10 mg b.i.d. to q.i.d.; alcoholism, 10 mg t.i.d. or q.i.d. in first 24 hours, then 5 mg t.i.d. or q.i.d. as needed; adjunctively in skeletal muscle spasm, 2 to 10 mg t.i.d. or q.i.d.; adjunctively in convulsive disorders, 2 to 10 mg b.i.d. to q.i.d. *Geriatric or debilitated patients:* 2 to 2½ mg, 1 or 2 times daily initially, increasing as needed and tolerated. (See Precautions.) ***Children:*** 1 to 2½ mg t.i.d. or q.i.d. initially, increasing as needed and tolerated (not for use under 6 months).

Supplied: Valium® (diazepam) Tablets, 2 mg, 5 mg and 10 mg; bottles of 100 and 500. All strengths also available in Tel-E-Dose® packages of 1000.

THE mudranes

All Mudranes are bronchodilator-mucolytic in action, and are indicated for symptomatic relief of bronchial asthma, emphysema, bronchiectasis and chronic bronchitis. **MUDRANE tablets** contain 195 mg. potassium iodide; 130 mg. aminophylline; 21 mg. phenobarbital (Warning: may be habit-forming); 16 mg. ephedrine HCl. **Dosage** is one tablet with full glass of water, 3 or 4 times a day. **Precautions** are those for aminophylline-phenobarbital-ephedrine combinations. **Iodide side-effects:** May cause nausea. Very long use may cause goiter. Discontinue if symptoms of iodism develop. **Iodide contraindications:** Tuberculosis; pregnancy (to protect the fetus against possible depression of thyroid activity). **MUDRANE-2 tablets** contain 195 mg. potassium iodide; 130 mg. aminophylline. **Dosage** is one tablet with full glass of water, 3 or 4 times a day. **Precautions** are those for aminophylline. **Iodide side-effects and contraindications are listed above. MUDRANE GG tablets** contain 100 mg. glyceryl guaiacolate; 130 mg. aminophylline; 21 mg. phenobarbital (Warning: may be habit-forming); 16 mg. ephedrine HCl. **Dosage** is one tablet with full glass of water, 3 or 4 times a day. **Precautions** are those for aminophylline-phenobarbital-ephedrine combinations. **MUDRANE GG-2 tablets** contain 100 mg. glyceryl guaiacolate; 130 mg. aminophylline. **Dosage** is one tablet with full glass of water, 3 or 4 times a day. **Precautions:** Those for aminophylline. **MUDRANE GG Elixir.** Each teaspoonful (5 cc) contains 26 mg. glyceryl guaiacolate; 20 mg. theophylline; 5.4 mg. phenobarbital (Warning: may be habit-forming); 4 mg. ephedrine HCl. **Dosage:** Children, 1 cc for each 10 lbs. of body weight; one teaspoonful (5 cc) for a 50 lb. child. Dose may be repeated 3 or 4 times a day. Adult, one tablespoonful, 4 times daily. All doses should be followed with ½ to full glass of water. **Precautions:** See those listed above for Mudrane GG tablets.

MUDRANE—original formula
First choice

MUDRANE-2
When ephedrine is too exciting or is contraindicated

MUDRANE GG
During pregnancy or when K.I. is contraindicated or not tolerated

MUDRANE GG-2
A counterpart for Mudrane-2

MUDRANE GG ELIXIR
For pediatric use or where liquids are preferred

Clinical specimens available to physicians.

Information for Contributors

Articles are accepted for publication on condition that they are contributed solely to this journal. Material appearing in MISSOURI MEDICINE is protected by copyright. Permission will be granted on request for reproduction in reputable publications provided proper credit is given and author gives permission.

Manuscripts should be typewritten, double spaced, and the original with one carbon copy submitted. Retain another carbon copy for proofreading. Used manuscripts are not returned. School and hospital appointments of the author should accompany the manuscript. It is desirable that a synopsis-abstract of approximately 135 words accompany the manuscript. References should be arranged at the end of the article in the order in which the references are cited in the text. The reference should give name of author, title of article, name of periodical, volume number, initial page number and year. Authors are responsible for reference accuracy.

Illustrations should be glossy prints or drawings in India ink on white paper. They should not be mounted and name of author and figure number should be penciled lightly on the backs. Legends should appear on a separate sheet. Colored illustrations will be used when suitable if author assumes the actual cost.

Legal difficulties may arise from unauthorized use of names, initials or photographs in which individuals can be identified. Permission should be secured from patient or legal guardian and signed duplicate or photostat submitted with such photographs or identification. The Editor and Editorial Board assume no responsibility for the opinions and claims expressed in articles contributed by authors. If citation of an institution related to the article is made, approval of the chief of service should be given in a letter accompanying the article.

Reprint order blanks will accompany proof, which will be sent to authors prior to publication.

All material other than scientific should be received prior to the first of the month preceding month of publication.

Please give notice of change of address at least one month in advance of the change, giving old and new addresses.

acute arthritic inflammation...heat that freezes

In acute rheumatoid arthritis consider Tandearil. The anti-inflammatory action of Tandearil quickly helps reduce heat, pain, swelling, and stiffness. Results are usually seen in 3 or 4 days. Try it for a week when the symptoms defy aspirin control.

Remember that Tandearil is not a simple analgesic. It should not be used on patients responding to routine therapy. Before using, please read the prescribing information. It's summarized below.

Tandearil® helps take the heat off

oxyphenbutazone NF

Geigy

Tablets of 100 mg.
Important Note: This drug is not a simple analgesic. Do not administer casually. Carefully evaluate patients before starting treatment and keep them under close supervision. Obtain a detailed history, and complete physical and laboratory examination (complete hemogram, urinalysis, etc.) before prescribing and at frequent intervals thereafter. Carefully select patients, avoiding those responsive to routine measures, contraindicated patients or those who cannot be observed frequently. Warn patients not to exceed recommended dosage. Short-term relief of severe symptoms with the smallest possible dosage is the goal of therapy. Dosage should be taken with meals or a full glass of milk. Patients should discontinue the drug and report immediately any sign of: fever, sore throat, oral lesions (symptoms of blood dyscrasia); dyspepsia, epigastric pain, symptoms of anemia, black or tarry stools or other evidence of intestinal ulceration or hemorrhage, skin reactions, significant weight gain or edema. A one-week trial period is adequate. Discontinue in the absence of a favorable response. Restrict treatment periods to one week in patients over sixty.
Indications: Acute gouty arthritis, rheumatoid arthritis, rheumatoid spondylitis.
Contraindications: Children 14 years or less; senile patients; history or symptoms of G.I. inflammation or ulceration including severe, recurrent or persistent dyspepsia; history or presence of drug allergy; blood dyscrasias; renal, hepatic or cardiac dysfunction; hypertension; thyroid disease; systemic edema; stomatitis and salivary gland enlargement due to the drug; polymyalgia rheumatica and temporal arteritis; patients receiving other potent chemotherapeutic agents, or long-term anticoagulant therapy.
Warnings: Age, weight, dosage, duration of therapy, existence of concomitant diseases, and concurrent potent chemotherapy affect incidence of toxic reactions. Carefully instruct and observe the individual patient, especially the aging (forty years and over) who have increased susceptibility to the toxicity of the drug. Use lowest effective dosage. Weigh initially unpredictable benefits against potential risk of severe, even fatal, reactions. The disease condition itself is unaltered by the drug. Use with caution in first trimester of pregnancy and in nursing mothers. Drug may appear in cord blood and breast milk. Serious, even fatal, blood dyscrasias, including aplastic anemia, may occur suddenly despite regular hemograms, and may become manifest days or weeks after cessation of drug. Any significant change in total white count, relative decrease in granulocytes, appearance of immature forms, or fall in hematocrit should signal immediate cessation of therapy and complete hematologic investigation. Unexplained bleeding involving CNS, adrenals, and G.I. tract has occurred. The drug may potentiate action of insulin, sulfonylurea, and sulfonamide-type agents. Carefully observe patients taking these agents. Nontoxic and toxic goiters and myxedema have been reported (the drug reduces iodine uptake by the thyroid). Blurred vision can be a significant toxic symptom worthy of a complete ophthalmological examination. Swelling of ankles or face in patients under sixty may be prevented by reducing dosage. If edema occurs in patients over sixty, discontinue drug.
Precautions: The following should be accomplished at regular intervals: Careful detailed history for disease being treated and detection of earliest signs of adverse reactions; complete physical examination including check of patient's weight; complete weekly (especially for the aging) or an every two week blood check; pertinent laboratory studies. Caution patients about participating in activity requiring alertness and coordination, as driving a car, etc. Cases of leukemia have been reported in patients with a history of short- and long-term therapy. The majority of these patients were over forty. Remember that arthritic-type pains can be the presenting symptom of leukemia.
Adverse Reactions: This is a potent drug; its misuse can lead to serious results. Review detailed information before beginning therapy. Ulcerative esophagitis, acute and reactivated gastric and duodenal ulcer with perforation and hemorrhage, ulceration and perforation of large bowel, occult G.I. bleeding with anemia, gastritis, epigastric pain, hematemesis, dyspepsia, nausea, vomiting and diarrhea, abdominal distention, agranulocytosis, aplastic anemia, hemolytic anemia, anemia due to blood loss including occult G.I. bleeding, thrombocytopenia, pancytopenia, leukemia, leukopenia, bone marrow depression, sodium and chloride retention, water retention and edema, plasma dilution, respiratory alkalosis, metabolic acidosis, fatal and nonfatal hepatitis (cholestasis may or may not be prominent), petechiae, purpura without thrombocytopenia, toxic pruritus, erythema nodosum, erythema multiforme, Stevens-Johnson syndrome, Lyell's syndrome (toxic necrotizing epidermolysis), exfoliative dermatitis, serum sickness, hypersensitivity angiitis (polyarteritis), anaphylactic shock, urticaria, arthralgia, fever, rashes (all allergic reactions require prompt and permanent withdrawal of the drug), proteinuria, hematuria, oliguria, anuria, renal failure with azotemia, glomerulonephritis, acute tubular necrosis, nephrotic syndrome, bilateral renal cortical necrosis, renal stones, ureteral obstruction with uric acid crystals due to uricosuric action of drug, impaired renal function, cardiac decompensation, hypertension, pericarditis, diffuse interstitial myocarditis with muscle necrosis, perivascular granulomata, aggravation of temporal arteritis in patients with polymyalgia rheumatica, optic neuritis, blurred vision, retinal hemorrhage, toxic amblyopia, retinal detachment, hearing loss, hyperglycemia, thyroid hyperplasia, toxic goiter, association of hyperthyroidism and hypothyroidism (causal relationship not established), agitation, confusional states, lethargy; CNS reactions associated with overdosage, including convulsions, euphoria, psychosis, depression, headaches, hallucinations, giddiness, vertigo, coma, hyperventilation, insomnia; ulcerative stomatitis, salivary gland enlargement.

change when he feels the best
ests of the patient will be serve

Shortcomings of Pro-Substituti Argument

The fact remains that it is
sary for the prescriber to know
the change is being contempla
and to be in a position to conse
demur. Without that opportuni
unilateral decision of the pharr
made in the absence of clinical
edge of the patient, could expo
to needless risks, and in additic
jeopardize the relationship bet
the professions of Pharmacy ar
Medicine. In my view, there is r
in the pro-substitution argume
offsets these risks.

The Issue of Drug Knowledge

Substitution advocates cla
that the primary justification fo
changing the rules is the desire
better utilize pharmacists' kno
about drugs. Yet the pharmacis
task to keep current on the enti
field of drug therapy, to some c
puts him at a disadvantage. Mc

ical care."

Drugs

nsurance rates and hospital
s are only two factors in health care costs. The cost of drugs—both prescription and nonprescription—is another.

And when it comes to drug costs, the nation's pharmacists *are concerned*. Through their national professional society, the American Pharmaceutical Association, pharmacists are advising the public to use nonprescription medication cautiously and conservatively, and to seek the advice of their pharmacist before selecting or purchasing such drugs.

Outdated Laws

The pharmacist also is aware that when it comes to prescription drugs, often he has an even greater opportunity to reduce the cost to the patient—with no sacrifice in the quality of the medication dispensed. But in many states, outdated and antiquated laws prevent the pharmacist from engaging in drug product selection. "Drug product selection" simply means that the pharmacist functions in the patient's interest by consciously choosing, from the multiple brands available, a low-cost quality brand of the specific drug to be dispensed in response to the physician's prescription order.

Much *misinformation* has been purposely spread by those who stand to gain financially by maintaining high drug costs to the public. An endless stream of propaganda has emanated from the drug industry in an effort to persuade the medical profession that these so-called anti-substitution laws should be retained. And as long as these laws are retained, the drug industry will continue its current marketing practices which contribute unnecessarily to high drug costs to patients. These practices also are inviting government agencies to expand their restrictive controls on physicians and pharmacists.

APhA Efforts

As pharmacists, we are concerned about health care costs. We hope that every physician shares our concern on this vital issue, and will give his personal support to the constructive efforts APhA has undertaken in the interest of all patients.

(For a complete discussion of drug product selection, you are invited to request a free copy of the "White Paper on the Pharmacist's Role in Product Selection" from: American Pharmaceutical Association, 2215 Constitution Avenue, N.W., Washington, D.C. 20037.)

lrugs that he selects to treat the
ty of conditions encountered in
ictice. Moreover, the physi-
choice of a specific brand is
on his knowledge of the pa-
medical history and current
ion, and his experiences with
rticular manufacturer's
ct.

Some substitution proponents
ırgued that the dispensing of a
ription is a simple two-party
ıction between the pharmacist
ıe patient, and that a substitut-
ıarmacist may avoid even a
ical breach of contract by simply
ing the patient that he is making
ıbstitution. I would judge that
ourts would be sympathetic
d a pharmacist who substituted
ut physician approval and who
took a legal defense that seeks
ke the patient responsible for
ıarmacist's actions.

ced Prescription Prices?

Substitution advocates are
esting to the consumer, and par-
ırly the consumer activist, that
ced prescription prices could
v legalization of substitution.
ave seen absolutely no evidence
tify this claim. To the contrary,
rience in Alberta, Canada, where
titution is authorized, suggests the opposite.

Many pharmacists understandably are concerned about the cost of maintaining multiple stocks of similar products. While there is no doubt that inventory costs rise when additional brands are stocked, it would be interesting to know how much they rise, and how many pharmacists actually stock *all* brands—of, say, ampicillin or tetracycline—or how long they keep "slow moving" products on their shelves before they are returned for credit. To ask that the industry eliminate multiple sources is to ask competitors to stop competing.

Drug Substitution—A License for the Unethical

Anti-substitution repeal would favor "corner cutting" pharmacists and manufacturers. For them, free substitution would be not a right, but a license. As an aftermath, it is quite likely that the confidence of both physicians and patients in the profession of Pharmacy would be eroded, as revelations about the unconscionable behavior of an undisciplined few were magnified in the press or in professional circles.

Summary

In short, what the American Pharmaceutical Association advocates as a broad-spectrum panacea looks to us to be not only a minority view (advocacy of substitution is by no means a uniform policy in Pharmacy), but also an extraordinarily costly and ineffective remedy, whose side effects are odious. We believe (1) that an impressive majority of pharmacists prefer to work with Medicine and with industry, for the consumer, and for the general good, (2) that they seek the privilege to substitute when the patient might gain and when the patient's doctor agrees, and (3) that they seek to work for the resolution of genuine grievances openly and professionally.

(For amplification of PMA views, please write for our booklet, "The Medications Physicians Prescribe: Who Shall Determine the Source?" It is available from: Pharmaceutical Manufacturers Association, 1155 Fifteenth Street, N.W., Washington, D.C. 20005.)

MSMA

NEWS

ROUND - UP

JUNE, 1973

MSMA occupies new Headquarters

With remodeling work nearly completed, the Missouri State Medical Association has oved into its new Headquarters at 113 Madison Street in Jefferson City.

The Association purchased the four-story structure last fall and extensive renovation ork was done during the winter. The interior of the building was completely modernized hile the exterior, upon completion, will be restored to blend with the historic nature of the rea.

The building is one of three identical structures built by former Governor B. Gratz Brown in 1871. The other two structures are occupied by the Cole County Historical Society nd the Associated General Contractors of Missouri.

Governor Brown resided in the structure now occupied by the Historical Society while he present Governor's Mansion was being constructed across the street. He moved into he present Mansion in 1873.

The site of the new MSMA Headquarters, although part of Jefferson City and Missouri history, is advantageously located in the heart of the State Government Complex. Directly across from the Governor's Mansion, the new Headquarters is within two blocks of the State Capitol and other state agency offices.

Featuring carpeting and air-conditioning throughout, the building has been redecorated with the generous utilization of coordinated and contrasting paneling and office furniture.

The Board Room, work room and store rooms are reached both from the walkout level at the rear of the building and down a short flight of steps from the front entrance.

The second and third stories of the building feature private offices, secretary desks and restrooms. The fourth floor is currently used for storage but could be transformed into expansion office space if needed.

Physicians visiting the Headquarters will be within walking distance of most state government agencies.

The telephone number of the MSMA remains 314-636-5151.

A future issue of MISSOURI MEDICINE will feature a picture section on the new Headquarters.

MSMA members are urged to drop by their new Headquarters when they next visit the Capital City.

uncilors elected

lected to the MSMA ncil during the 115th ual Session were t to right) Drs. ene T. Hansbrough, n District; Lysle M. h, 2nd District; Rob- E. Bregant, 5th Dis- t; Howard J. McAl- y, 8th District; Wil- n D. Bradshaw, 6th trict; and Louis P. lage, 4th District.

Students earn Merit Awards from MSMA

Three graduating medical students were recently presented the Missouri State Medical Association's Merit Award.

The MSMA Award, which consists of a certificate and a savings bond, is presented annually to the graduating student with the highest scholastic ranking in each of Missouri's medical schools. The medical school at the University of Missouri-Kansas City deferred all awards for its first graduating class but is expected to participate beginning next year.

Receiving the 1973 awards were Alan Charles Moses, M.D., St. Louis, Missouri, Washington University School of Medicine; Louis E. Schroder, Jr., M.D., Cincinnati, Ohio, St. Louis University School of Medicine; and Stephen Theodore Brown III, M.D., St. Joseph, Missouri, University of Missouri-Columbia School of Medicine.

Seven MSMA members on State CHP

Gov. Christopher S. Bond recently named seven members of the MSMA to the Governor's Advisory Council on Comprehensive Health Planning.

Those appointed are C. Howe Eller, M.D., and C. Reed Boles, M.D., both of St. Louis County; E. Grey Dimond, M.D., Kansas City; James Dexter, M.D., Columbia; Herbert Domke, M.D., Jefferson City; Phillip W. Carr, M.D., Springfield; and J. W. Fleming, M.D., Moberly.

50-Year Club 'happily' has no duties - just fun

Does "74 to 100" mean anything to you?

It did to those 24 physicians attending the annual meeting of the 50-Year Club of the Missouri State Medical Association. The meeting was held in conjunction with the MSMA 115th Annual Session.

The age span of those present ranged from 74-years-old to 100-years-old and, according to Armand D. Fries, M.D., President of the group, each physician was asked to say a few words after a general discussion topic of "trivia." Dr. Fries, who in true democratic sense was informed two weeks before the meeting that he was President, said the organization "happily" has no duties to perform and no power — therefore, everyone present had a fine time.

Those present were Drs. William Olmsted, George V. Feist, Clinton Kleinschmidt, Thos. B. Hall, Leo P. FitzGerald, Theo. H. Hanser, Maurice Lonsway, Sr., Ellsworth Kneal, Harry C. Lapp, John W. William, H. H. Kramolowsky.

W. H. Walters, Clinton W. Lane, J. Paul Altheide, John F. Rutledge, R. Graham Fick, J. H. McCurry, C. E. Gilliland, Fred W. Teiber, Arthur D. Knabb, Edgar W. Spinzig, Paul Lowenstein, Robert Mueller and Armand D. Fries.

George H. Ladyman, M.D.........PSRO ta

Interest, concern in PSRO draw 103 physicians to TAP

Growing interest and concern in the much-d cussed PSRO issue was evidenced May 11-13 more than 100 physicians turned out for the T Institute at the Lake of the Ozarks.

Although Professional Standards Review Orga izations represented only a part of the TAP agenc it was the underlying issue for most of the progra

Along with 103 physicians, 200 hospital admi istrators and 63 hospital trustees attended the me ing. George H. Ladyman, M.D., of Poplar Blu Chairman of the MSMA Commission on Continui Education and Health Manpower, was the offici MSMA representative at the meeting. Dr. Ladym also gave the welcoming address.

The Institute, put on by the Joint Commissi on Accreditation of Hospitals, was cosponsored the MSMA and the Missouri Hospital Associatio

Charles M. Jacobs, J.D., assistant director JCAH, told the audience that if the private sec fails to set up an acceptable PSRO system, it be forced to take a "package form" system devis by the government. However, Jacobs added that a viable PSRO system is established by the priva sector prior to the federal deadline, the governme may approve that system.

Promotion ads criticized

The AMA Judicial Council recently rea firmed its opinion that a physician who pe mits his name and photograph to be used advertising promotion is acting contrary the ethical principles of the profession.

Charges of conduct contrary to the Pri ciples of Medical Ethics should be brought local medical societies when the facts "in cate that the honor and dignity of the prof sion are denigrated," said the council.

Special Feature

What Does the AMA Do for YOU?

By

David B. Weihaupt
Director, AMA Department of Planning
and Development

Following is a transcript of the address delivered by Mr. Weihaupt at the annual MSMA Public Affairs Conference held in Jefferson City on February 3-4.

I'D LIKE TO BEGIN by saying I am under no delusions of grandeur that the AMA is loved and understood by the physicians of this country.

I know these questions are asked many thousands of times per year . . . "What has the AMA ever done for me?" and "What am I getting for my dues?"

I am here to tell the truth and to offer the correct information about the American Medical Association and AMPAC and what they are doing. I hope you accept what I say as well as many people accept the fallacies printed about us in the local newspapers and national magazines and on TV. But, let me clarify. I am not a propaganda peddler or a brainwasher for the AMA. I will not excuse or apologize, but I will defend and debate. Someone must, because it's the new rage to abuse the AMA.

The purpose of the Association is to promote the science and the art of medicine for the betterment of public health:

A. There are approximately 351,000 physicians in this country, of which 210,000 are AMA members. This means $13 million in lost revenues because one in three won't support his own profession. However, AMA dues-paying membership is increasing.
B. Approximately 55% of our total budget is from physicians' dues. The remainder or 45% is our advertising and exhibit revenue.
C. The IRS unrelated income tax of 47% doesn't cover the new dues increase.
D. Approximately $10 million of the budget goes for salaries for the 922 employes.
E. Real estate taxes are approximately $275,000 and Social Security payments are approximately $350,000 and up.

The AMA is one of the world's largest publishers. About $12 million of our budget goes into paper, printing and mailing as follows:

A. The *AMA News* has a circulation of 20 million newspapers per year.
B. We have approximately 1,600 different pamphlets on child care, health education, health tips, sex education.
C. We just mailed four million free pamphlets on the pill.
D. The magazine, *Today's Health*, reaches six and one half million Americans per month.
E. 100,000 kits on drug abuse are sent to medical societies and individual physicians.
F. *JAMA,* the Journal of the American Medical Association, has an annual circulation of 12 million.

Why all this paper? These publications have been requested by the 242 members of the AMA House of Delegates, by the public of this country, the schools of this nation, allied health professions and health institutions and, also, the more than 2,000 state and county medical societies.

As a result of the requests, we research, plan, design, publish and print and mail these tens of millions of pieces every year. This is the responsibility of the AMA to the physicians and to the people of this country, and it is a responsibility we must keep. Or, would you have us yield to someone else? Shall we say the state government or the federal government or labor?

Please think about these points:

A. In one day at the AMA, 3,000 long distance calls are received. Membership services receive 137,000 per year.

B. 23,000 pieces of first class mail come into the AMA every day. Membership services receives 212,000 pieces per year. This is six million pieces of mail every year.

C. Each week, we receive 1,000 requests from the general public for help and information, and we get many thousands more requests for information from physicians, whether or not they are members.

D. We make 8,000 changes in physicians' home and office addresses in our card catalog every week.

E. In an average month, the Archive Library receives 3,000 research requests and 750 requests for books. Also, they photocopy and send out approximately 25,000 pages of material each month.

F. The AMA-ERF Student Loan Program has arranged for more than $51 million in loans to medical students, interns and residents. The average annual physician contribution in this country is $2.50. Since 1955, we have distributed more than $35 million to medical schools in this country, and the 80 councils and committees function continually for the public and profession. Nine hundred practicing physicians serve on these councils and committees.

The AMA Department of Investigation wages a relentless battle every day against the quacks and charlatans who abuse the public and smear the name of doctor.

I would now like to discuss that which the press dearly likes to write about, the Washington lobby. This is the big arena in which we are facing crisis after crisis every day.

The press writes about the lobby as a huge multimillion dollar organization that opposes everything. But, only 1% of the budget of the AMA goes toward lobbying. This so-called multimillion dollar lobbying staff, in truth, consists of four registered lobbyists. Yes, we have only four men in Washington compared to labor's 425 lobbyists.

Each of our four men has 25 senators and approximately 110 congressmen to know, work with and convince. A small force, indeed, but don't let me minimize their abilities, their influence, their effectiveness and their successes. They do an outstanding job.

The Washington office fills 600 requests per month from government agencies and congressmen and senators and our men have the finest professional relationship that has ever existed in the Halls of Congress.

Let me give you some information about what this lobbying staff is really up against. In the 92nd Congress, 20,000 bills were introduced (65 per legislator), 3,000 of them with medical implications.

We have one man in Washington to analyze these 3,000 bills. We favor 85% of the bills on which we testify.

Some of the fights that these men face in Washington are as follows:

There are attempts for unannounced federal inspection of your records, federal honor oaths, federally run peer review, federal compulsory generic prescribing, federal fee schedules, federal HMOs, and a $84 billion federal national health insurance program that will require relicensure of all M.D.s in the United States. This bill did not pass only because your AMA stood in its path.

Of course, some refer to our great legislative failure which was the passage of the Medicare law. However, we defeat 50 worse than that in every session of Congress.

So, we must have a strong lobby to add common sense to the 3,000 bills with medical implications in Congress.

We are the only plug in the dike to prevent a flood of polluted medical legislation from oozing over the profession. I believe that this is most of what we are doing for you now. Practically every function of your practice has something to do with laws and legislation.

AMPAC or politics are bad words to some physicians. It (AMPAC) is considered the illegitimate child of the medical society to some. But, it's really just helping at the polls those who share your political beliefs and setting a climate to advise government in writing good, workable medical legislation.

More than one third of a century ago in 1935, a group of intelligent, sophisticated and determined men sat down to solve a problem. That problem was "How to get Congress to do what they wanted them to."

The solution really was quite simple—manpower, membership plus money to put men in office who share their beliefs. These men were leaders of American organized labor, now the Ruther Committee of 100, ergo the Kennedy Bill.

Time and time again, congressmen told our four lobbyists that they didn't care about organized medicine and care only about the folks t home in the district who voted them into ofice. They often said, "Where were you when I ieeded you? All you AMA people do is ask for ielp. Did you ever think of giving any help?"

The congressmen sensibly choose political surival to political suicide.

That was a good hint. In 1961, one fourth of century after labor, AMPAC was formed and 0 state PACs were formed. Now, the folks back it home in the district became organized medcine's voice, our new voice which was founded en years ago after 90 years of laryngitis.

It was agony selling the political action-MPAC idea to doctors when we started. Many aid that political involvement would destroy heir image. Most have since found out that oninvolvement could destroy their practices.

Today, we have tens of thousands of members ind each year brings a record year, as did 1972.

AMPAC is the fastest growing political influence in the history of this country and the fourth largest, most influential political power in the U. S. Preceding it are the Democratic Party, first; Republican Party, second; and COPE, third.

What does AMPAC do in an election year? It selects a candidate to support on the basis of his voting record, philosophy and need. It provides survey research, survey teams and computer analysis—direction on issues. It provides AMPAC and state PAC campaign funds. It provides campaign management advice and organizes Candidate Support Committees from the medical community.

Win or lose, we end up with a Congress of so many friends and so many nonfriends. However, the climate of the Congress changes. Our nonfriends know that they have been in a fight and don't want another one like it. They now have a respect for a voice that is becoming familiar to them, the voice of medicine.

Political suicide to them now may become opposing the medical-political community at home.

We don't broadcast our success. It is poor politics, and winning candidates do that for us. Why tell how you won the game? We may play again. Our win record is more than 80%, the best in the business.

So, there it is. It is not immoral, illegal or unethical. It's not arm twisting, dirty politics or socially improper. It is competing for a friendly ear in government, i.e., not looking for one but *building* one.

Many doctors don't agree with those whom we support or with what we stand for, but we have no hard line. We just want to prevent government from inviting 1,000 people to a free banquet when there is only food for one.

Yet, it has been said thousands of times by thousands of physicians, "AMA doesn't reflect my opinions." He who says that is wrong. Yes, we do reflect his opinions hundreds of times each day. AMA makes thousands of policy decisions every year. With 3,000 bills in Congress and 250 resolutions in the AMA House of Delegates, AMPAC makes thousands of decisions every year. They can't all be in the range of the doctors' beliefs. Some refuse to support us because we are too liberal. Some do so because we are too conservative and others because we are too fast, too slow, too hard, too soft.

How can we possibly win your sympathy unless you understand the problems? With whom do you agree all of the time? Is it your partner, profession, church, medical association, government or wife?

What about the abortion issue? Some leave us because we have liberalized our position and some because it isn't liberal enough. Shall we have two associations for each issue?

The press is full of exaggerated articles about the doctor rebellion in the AMA. I ask myself who and what are doctors rebelling against? Why us? We are not the enemy. Too many doctors edge up for a place at the wailing wall and lament the shortcomings of their medical association, their government and the abuses by the news media. Their cries would move a heart of stone, but do they help? To criticize is easy, but to be constructive is the challenge.

Some M.D.s expect the AMA to be the Messiah for all ideas, all solutions, all philosophy, all pure, all correct and, at all times, agreeing with them and for only $110 per year . . . their own god for the profession. And, when a perfect score isn't made, they quit the church before the collection plate comes around.

So, when I am asked "What do I get for my dues?" . . . my short replay is, "Nothing." Who said the $110 in dues would come back to the doctor on January 1 each year as a short term capital gain? Tangibles bought in a retail store for $110? No, the AMA is not an investment nor a gift house. It's a hard-working, hard-fighting organization serving the profession well. And, when a doctor joins AMPAC, we don't promise a win. We promise a hard fight. We are employed as gladiators to fight in the arena, but if we lose one, often we get thumbs down.

The physicians joining the AMA, the state *medical association, your county medical society and AMPAC is providing a service not only to his profession, but to himself and, yes, even to his patients. What does quitting the AMA prove? Nothing . . . except to weaken it.*

If the preceding information does not convince you of what we did for you yesterday and today, of our planning for tomorrow and of the dedication of the AMA to the profession and the people of this country, I wish to ask the following favors of you:

A. Read with a critical eye the newspapers and magazines of this country that misshape our image and misinterpret our work.
B. Don't quote your enemies; quote your friends. The state and county societies and the AMA aren't the ones who are passing the bills to tell doctors how to practice medicine.
C. Also, don't criticize the AMA, AMPAC, county and state societies with inaccurate information.

Now, let me ask you the questions. "Are we doing what you want us to do? If not, tell us what you want." Perhaps the AMA cannot change the course of history, but when the final judgment is written, let it be written that we worked and fought, for we refused to lose your profession to the social planners by default.

A physician once said to me, "If things get worse at the AMA, you will probably lose your job." I said, "No sir, but you may lose yours."

PRESCRIBING INFORMATION
Antiminth (pyrantel pamoate) Oral Suspension

Actions. Antiminth (pyrantel pamoate) has demonstrated anthelmintic activity against *Enterobius vermicularis* (pinworm) and *Ascaris lumbricoides* (roundworm). The anthelmintic action is probably due to the neuromuscular blocking property of the drug.

Antiminth is partially absorbed after an oral dose. Plasma levels of unchanged drug are low. Peak levels (0.05-0.13μg/ml.) are reached in 1-3 hours. Quantities greater than 50% of administered drug are excreted in feces as the unchanged form, whereas only 7% or less of the dose is found in urine as the unchanged form of the drug and its metabolites.

Indications. For the treatment of ascariasis (roundworm infection) and enterobiasis (pinworm infection).

Warnings. *Usage in Pregnancy:* Reproduction studies have been performed in animals and there was no evidence of propensity for harm to the fetus. The relevance to the human is not known.

There is no experience in pregnant women who have received this drug.

Precautions. Minor transient elevations of SGOT have occurred in a small percentage of patients. Therefore, this drug should be used with caution in patients with pre-existing liver dysfunction.

Adverse Reactions. The most frequently encountered adverse reactions are related to the gastrointestinal system.

Gastrointestinal and hepatic reactions: anorexia, nausea, vomiting, gastralgia, abdominal cramps, diarrhea and tenesmus, transient elevation of SGOT.

CNS reactions: headache, dizziness, drowsiness, and insomnia. Skin reactions: rashes.

Dosage and Administration. *Children and Adults:* Antiminth Oral Suspension (50 mg. of pyrantel base/ml.) should be administered in a single dose of 11 mg. of pyrantel base per kg. of body weight (or 5 mg./lb.); maximum total dose 1 gram. This corresponds to a simplified dosage regimen of 1 cc. of Antiminth per 10 lb. of body weight. (One teaspoonful = 5 cc.)

Antiminth (pyrantel pamoate) Oral Suspension may be administered without regard to ingestion of food or time of day; and purging is not necessary prior to, during, or after therapy. It may be taken with milk or fruit juices. Because of limited data on repeated doses, no recommendations can be made.

How Supplied. Antiminth is available as a pleasant tasting caramel-flavored suspension which contains the equivalent of 50 mg. pyrantel base per ml., supplied in 60 cc. bottles.

Notes of interest from Here . . . . and There

Dr. Durward G. Hall of Springfield and Washington, D. C., a former Missouri Seventh District Congressman, has been appointed to the board of regents of the Uniformed Services University of the Health Sciences. While in Congress, Dr. Hall was instrumental in passage of legislation which created the new Armed Forces institution which will graduate doctors for the U. S. military services, with possible elimination of the necessity to draft doctors away from civilian practices. Among others named to the board are **Malcolm Todd,** M.D., chairman of the AMA Council on Health Manpower, and **H. Ashton Thomas,** M.D., secretary of the Louisiana State Medical Society.

A team of American heart specialists headed by **Dr. E. Grey Dimond,** provost for health sciences at the University of Missouri-Kansas City, entered China on April 22 at the invitation of the People's Republic of China. The trip followed a tour of this country by Chinese physicians in October, 1972. Dr. Dimond, who made the arrangements for both trips, said the Chinese Medical Association invited him and seven other physicans to spend 14 days in China giving lectures and exchanging information. Sponsors of the visit are the American College of Cardiology and the Bureau of Educational and Cultural Affairs of the U. S. State Department.

Dr. Donald R. St. John is the new Clinical Director of the Marshall State School and Hospital. His appointment became effective on April 1. Dr. St. John has been a member of the State School medical staff and a resident of Marshall for the past seven years. He is a graduate of the St. Louis University School of Medicine.

Dr. Wilber B. Spalding, Plattsburg, has retired after practicing medicine for 43 years. He opened his practice in Plattsburg in 1928. Described as "a man who has served his profession and community faithfully and with dedication," Dr. Spalding has received special citations from the Pony Express Council of the Boy Scouts in St. Joseph and from the Rotary Club. Dr. and Mrs. Spalding are the parents of two sons who are ophthalmologists. They are **Dr. Wilber B. Spalding, Jr.** of Kansas City and **Dr. David Spalding** of Springfield.

Dr. Theodore H. Aschman, Kansas City, was one of five persons to be awarded an alumni citation from McPherson College in Kansas at the annual alumni dinner on May 1. Dr. Aschman, who has practiced obstetrics and gynecology since 1920, retired in October of last year.

For the third consecutive year, **Dr. John T. Logue** of Columbia has supplied an unusual gavel which sounds the opening and closing of the annual Journalism Week banquet at the University of Missouri. Obtained from Brazil, Dr. Logue's "Gavel '73" was donated by Project HOPE, courtesy of **Dr. William B. Walsh,** HOPE's founder and director. Dr. Logue became involved with HOPE in 1966 when he served for two months aboard the Project's hospital ship S. S. HOPE while it was docked at Corinto, Nicaragua. Created for the occasion, the Journalism Week gavels are retired to a special exhibit case in Neff Hall at the University.

Missouri senators and representatives were honored at he Legislative Day Luncheon in Jefferson City on April 11. *(Left to right)* Sen. Truman E. Wilson of St. Joseph; Mrs. Charles R. Willman, President of the MSMA Auxiliary; and Sen. William J. Cason of Clinton, president pro-tem of the Missouri Senate.

Senator Cason Addresses Woman's Auxiliary at Annual 'Legislative Day' Luncheon

"Know your senator and know your representative!"

This advice was offered by Sen. William J. Cason, president pro-tem of the Missouri Senate, when he addressed more than 120 Missouri physicians' wives who attended the MSMA Woman's Auxiliary's annual Legislative Day in Jefferson City on April 11.

The members of the Woman's Auxiliary had travelled to the Capital City from communities throughout the state to observe their second successful Legislative Day. After visiting the Missouri House of Representatives and Senate, members of the group toured the State Capitol Building, honored representatives and senators from their respective districts at a luncheon at the Hotel Governor and then toured the historic Governor's Mansion.

Mrs. Charles R. Willman of St. Joseph, President of the MSMA Auxiliary, said that the purpose of the day is to give the physicians' wives an opportunity to observe the state's seat of government and to see their representatives in action. It also is to accelerate the Auxiliary's interest in legislative affairs and their effect upon the medical profession and health care fields.

Members of the group were introduced to the House of Representatives by Rep. Mark A. Youngdahl of St. Joseph (9th District) and to the Senate by Sen. Truman E. Wilson of St. Joseph (34th District).

Mrs. Willman and Mrs. George J. Lytton, of Kansas City, President-Elect of the Auxiliary, were honored by personal introductions on the floor of the house. Miss Charlotte Willman and Miss Kerri O'Connor also received special recognition by being named Honorary Pages of the Day in the House of Representatives. Miss O'Connor is the daughter of Dr. and Mrs. William O'Connor, St. Joseph.

Mrs. Willman presided at the luncheon. She introduced Senator Wilson who spoke briefly. He then introduced Senator Cason.

Members of the Woman's Auxiliary to the Cole County Medical Society were hostesses for Legislative Day. Four of the Jefferson Citians are shown here visiting with their senator. *(Left to right)* Mrs. Jack S. Sanders; Mrs. James Gordon, MSMF Chairman for the MSMA Auxiliary; Sen. Ralph Uthlaut, Jr. (23rd District), New Florence; Mrs. H. K. Kanagawa, President-Elect in Cole County; and Mrs. David Scott.

Boone County Auxiliary members visited with the 19th District's Sen. Larry R. Marshall: *(Left to right, seated)* Mrs. George P. Wilson, Senator Marshall and Mrs. William Gaunt. *(Standing)* Mrs. James Denninghoff and Mrs. Tom McMurry. All are from Columbia.

Jackson County Auxiliary members were proud to introduce their Rep. Alex J. Fazzino (22nd District), who also is from Kansas City. *(Left)* Mrs. Pat A. Barelli and *(right)* Mrs. Glenn Elliott.

Sen. Paul L. Bradshaw (30th District) and friends from Springfield and Greene County Medical Auxiliary. *(Left)* Mrs. DeArmand Moore and *(right)* Mrs. Howard J. McAlhany. Dr. McAlhany is Councilor for the Eighth Councilor District of the Missouri State Medical Association.

Mrs. Wallace R. Stacey of Independence, a Past-President of the MSMA Woman's Auxiliary, was hostess to two legislators—*(left)* Sen. Lem T. Jones, Jr. (10th District) of Kansas City and *(right)* Sen. Jack E. Gant (16th District) of Independence.

Senator Cason complimented the Auxiliary members for their active interest in legislation and cited Mrs. Keith D. Jones of Warrensburg, Immediate Past-President of the Auxiliary, who initiated the annual Legislative Day during her term of office in 1972.

He encouraged the women to increase their knowledge and involvement in influencing the passage of good legislation pertaining to the health fields. He described the state's new "Hot Line" as an excellent source of information regarding the status of all bills introduced in the House and Senate.

Others who spoke briefly at the luncheon included Mrs. James A. Reid of Marshall, Auxiliary Public Affairs and MMPAC Chairman; Mrs. Gerald L. Miller of Kansas City, Legislative Chairman; and Raymond A. McIntyre of Jefferson City, executive secretary of the Missouri State Medical Association.

Mrs. Jerome Schmidt of Jefferson City, President of the Cole County Woman's Auxiliary and Mrs. Harold Robb, Legislative Chairman for Cole County, made arrangements for the luncheon and other events of the day.

WASHINGTON

Federal health expenditures in the current fiscal year will exceed $42 billion—an increase of $2 billion over the previous fiscal year.

The report on *Federal Medical-Health Appropriations,* prepared by the American Medical Association's department of governmental relations, offers a unique view of the federal government's overall involvement in health and health related activities.

In most cases, supplemental appropriations for specific programs are not included, meaning that actual figures are higher than presented. The bulk of the report deals with appropriations, but a table also shows estimated spending this fiscal year on trust fund and other expenditures for disability in various programs including Social Security, Veterans administration, military disability retirement and railroad retirement.

Considering appropriations alone, the total for the present fiscal year is $28.3 billion compared with $26.5 billion the previous year. Federal Medicare expenditures of $9.5 billion are included although $6.6 billion come from the Social Security Medicare trust fund for part A or hospital benefits. The Medicare law requires these funds to be treated as appropriations by Congress.

The Health, Education and Welfare Department, of course, leads the list in appropriations with $18.1 billion compared with $17.6 billion the year before. In order come the Veterans Administration, $2.9 billion; Defense, $2.8 billion; Environmental Protection, $2.3 billion; Federal Employes Health Insurance, $604 million; Agriculture, $362 million (animal and plant health inspection, etc.); State, $258 million; and OEO, $150 million.

In the nonappropriations area, Social Security payments to disabled workers were $4.2 billion, service-connected VA disability payments were $3 billion and nonservice connected, $1.5 billion.

A sweeping study has allayed the fear that this nation would become flooded with ex-GI drug addicts by finding that very few young soldiers who took narcotics in Vietnam have continued their addiction in civilian life.

The study also presented information indicating the physical grip of heroin addiction may not be as strong as heretofore believed—"one half of all those who reported heroin dependency in Vietnam had withdrawn on their own."

Commenting on the $400,000 study, Richard S. Wilbur, M.D., assistant secretary of defense for health and environment, declared:

"We now know that recovery from heroin dependency is not impossible; and that in the case of young, healthy, well-disciplined men in the armed services, rehabilitation will be successful in the majority of cases."

Dr. Wilbur compared the narcotic dependence rate of 1.3% among Vietnam returnees with the 1.2% rate of drug abusers identified in the civilian population of young draftees and recruits. He estimated the number of addicts of all Vietnam veterans at about 2,000 to 3,000 of the 313,000 enlisted men who served in Vietnam during the high use period in the last several years of the war. Little heroin was used prior to this by U. S. troops.

The study, prepared under the direction of Lee Robins, Ph.D., Professor of Sociology in Psychiatry at Washington University, was originated by the special White House action office on drug abuse and funded by the Defense Department, the Veterans Administration, the National Institute of Mental Health and the Labor Department. Some 900 enlisted men were interviewed.

Dr. Wilbur told a Pentagon news conference that there are many myths surrounding addiction. "I was taught that anyone who ever tried heroin was instantly, totally and perpetually hooked," he said.

"Treatment success rates were reported to be less than 5%. Therefore the use of methadone maintenance for all heroin addicts and even legalization of heroin seemed desirable to some advocates because it seemed impossible to get off heroin."

But the accumulating data being gathered by Defense in the wake of the Vietnam drug crises, including the latest report entitled "A followup of Vietnam drug users," has caused "us to reexamine the old beliefs more critically," said Dr. Wilbur.

The followup study said that only 7.2% of the men who had been detected as narcotic users in Vietnam had felt narcotic dependent at any time since their return. Dr. Wilbur pointed out that

What Missouri doctors need is a **Malpractice Liability Carrier** that won't fade when trouble comes.

93% of the men who had been identified in the service as drug users had not returned to their drug dependence upon return from Vietnam. This closely parallels estimates of success in Defense rehabilitation programs.

Dr. Wilbur, in referring to inservice treatment programs, reported more than 70,000 men had been treated for drug abuse with more than 59,000 either restored to duty or released from active service following successful rehabilitation, more than 6,000 men remained in short term rehabilitation and 4,000 more had been referred to the Veterans Administration for lengthier treatment at the end of their service tour.

The National Institutes of Health have announced a ban on research involving live aborted fetuses. The restriction applies only to NIH-supported research, but it is expected to be observed in much of the other medical research in this country.

Dr. Robert Berliner, NIH deputy director for science, said: "We know of no circumstances at present or in the foreseeable future which would justify NIH support of research on live aborted human fetuses."

Dr. John F. Sherman, NIH acting director, said any scientist receiving NIH funds found to be doing experiments on live aborted human fetuses would be asked to stop even if NIH funds were not allotted to that particular research.

The ban did not apply to fetal tissue but only on live fetuses capable of being kept alive under laboratory conditions for several hours after abortion.

The NIH announcement was prompted by a protest march being planned by seniors at the Stone Ridge Country Day School of the Sacred Heart, a Roman Catholic school for girls adjacent to the NIH in Bethesda, Md.

Must vasodilators and therapy for other diseases come into conflict?

not if the vasodilator is

VASODILAN®

(ISOXSUPRINE HCl)

the compatible vasodilator... no treatment conflicts reported

The cerebral or peripheral vascular disease patient often has coexisting disease[1] which calls for another drug along with his vasodilator. It may be a hypoglycemic, miotic, antihypertensive, diuretic, anticoagulant, corticosteroid, or coronary vasodilator.

Vasodilan is not incompatible with any of these drugs—no treatment conflict has been reported. And, unlike other vasodilators, Vasodilan has not been reported to affect carbohydrate metabolism, liver function, or intraocular pressure—or to complicate treatment of diabetes, hypertension, peptic ulcer, glaucoma, or liver disease.

In fact, there are no known contraindications to the use of Vasodilan in recommended oral doses, other than that it should not be given in the presence of frank arterial bleeding or immediately postpartum.

1. Gertler, M. M., et al.: Geriatrics *25*:134-148 (May) 1970.

Indications: Based on a review of this drug by the National Academy of Sciences-National Research Council and/or other information, the FDA has classified the indications as follows:

Possibly Effective:

1. For the relief of symptoms associated with cerebral vascular insufficiency.
2. In peripheral vascular disease of arteriosclerosis obliterans, thromboangiitis obliterans (Buerger's Disease) and Raynaud's disease.
3. Threatened abortion.

Final classification of the less-than-effective indications requires further investigation.

Composition: Vasodilan tablets, isoxsuprine HCl, 10 mg. and 20 mg.

Dosage and Administration: 10 to 20 mg. three or four times daily.

Contraindications and Cautions: There are no known contraindications to oral use when administered in recommended doses. Should not be given immediately postpartum or in the presence of arterial bleeding.

Adverse Reactions: On rare occasions, oral administration of the drug has been associated in time with the occurrence of severe rash. When rash appears, the drug should be discontinued. Occasional overdosage effects such as transient palpitation or dizziness are usually controlled by reducing the dose.

Supplied: Tablets, 10 mg.—bottles of 100, 1000, 5000 and Unit Dose; 20 mg.—bottles of 100, 500 and Unit Dose.

MeadJohnson LABORATORIES

Pinworm therapy is often a family affair

Contraindications: History of hypersensitivity to thiabendazole. **Warnings:** If hypersensitivity reactions occur, drug should be discontinued immediately and not resumed. Rarely, erythema multiforme has been associated with thiabendazole therapy; in severe cases (Stevens-Johnson syndrome), fatalities have occurred. Because CNS side effects may occur quite frequently, activities requiring mental alertness should be avoided. Safe use in pregnancy or lactation has not been established. **Precautions:** Ideally, supportive therapy is indicated for anemic, dehydrated, or malnourished patients prior to initiation of anthelmintic therapy. In presence of hepatic or renal dysfunction, patients should be carefully monitored. **Adverse Reactions:** Most frequently encountered are anore , nausea, vomiting, and dizziness. Less frequently, diarrhea, epigastric distress, pruritus, weariness, drowsiness, giddin s, and headache have occurred. Rarely, tinnitus, hyperirritabil , numbness, abnormal sensation in eyes, blurring of vision, xanthopsia; hypotension, collapse; enuresis; transient rise i cephalin flocculation and SGOT; perianal rash, cholestasis a parenchymal liver damage; hyperglycemia; transient leukop ia. malodor of the urine, crystalluria, hematuria; appearance o ve Ascaris in the mouth and nose. Hypersensitivity reactions

INDICATION | DOSAGE SCHEDULE

MINTEZOL® (Thiabendazole, MSD) has demonstrated effectiveness against a broad spectrum of nematode infections. Dosages are weight related. For your convenience, the information in the weight-dose chart below is included in the full prescribing information and in the 1973 edition of PDR.
The recommended maximum daily dose of MINTEZOL is 3 g (6 tablets).
MINTEZOL should be given after meals if possible. Dietary restriction, complementary medications, and cleansing enemas are not needed.
The usual dosage schedule for all conditions is two doses per day. The size of the dose is determined by the patient's weight.

Weight-dose chart:

WEIGHT (lb)	EACH DOSE (g)	TABLETS
25	0.25	½
50	0.5	1
75	0.75	1½
100	1.0	2
125	1.25	2½
150 & over	1.5	3

The regimen for each indication follows:

INDICATION	REGIMEN	COMMENTS
Pinworm disease	Two doses per day for 1 day. Repeat in 7 days. This regimen is designed to reduce the risk of reinfection.	If this is not practical, give 2 doses per day for 2 successive days.
Threadworm,* large roundworm,* hookworm,* and whipworm* disease	Two doses per day for 2 successive days.	A single dose of 20 mg/lb or 50 mg/kg may be employed as an alternative schedule, but a higher incidence of side effects should be expected.
Creeping eruption	Two doses per day for 2 successive days.	If active lesions are still present 2 days after completion of therapy, a second course is recommended.
Symptoms of trichinosis* during the invasive phase of the disease	Two doses per day for 2 to 4 successive days according to the response of the patient.	The optimal dosage for the treatment of trichinosis has not been established.

*Clinical experience with thiabendazole for treatment of each of these conditions in children weighing less than 30 lb has been limited.

SYNTHROID
T4

T_4 IS THE PREDICTABLE HORMONE BECAUSE IT LOVES PROTEIN.

SYNTHROID® (sodium levothyroxine) is pure synthetic T_4, the major circulating thyroid hormone. It is reliable to use because of its affinity for protein-binding sites in the blood. T_3 is more fickle. Sometimes it binds. Sometimes it doesn't. T_4 more *predictably* binds to protein.

RADAR
AHEAD

ALL THYROID-FUNCTION TESTS ARE USEFUL IN MONITORING SYNTHROID THERAPY

No calculations are needed, test interpretation is simple.

Any of the commonly used T_4 thyroid function tests (P.B.I., T_4 By Column, Murphy-Pattee, Free Thyroxine) are useful in monitoring patients on T_4 because they *all* measure T_4. Patients on SYNTHROID are thereby easy to monitor because their results will fall within predictable, elevated test ranges. Of course, clinical assessment is the best criterion of the thyroid status of the drug-treated patient.

TEST	HYPOTHYROID	SYNTHROID THERAPEUTIC NORMAL
P.B.I.	Less than 4 mcg %	6-10 mcg %
T_4 By Column	Less than 3 mcg %	7-9 mcg %
T_3 (Resin)	Less than 25%	27-35%
T_3 (Red Cell)	Less than 11%	11.5-18%
Free Thyroxine	Less than 0.7 nanograms %	0.7-2.5 nanograms %
Murphy-Pattee	Less than 2.9 mcg %	4-11 mcg %

HISTORICAL
MARKER

TWO GOOD REASONS WHY THE ROAD TO NORMALIZED THYROID STATUS IS SO SMOOTH FOR THE SYNTHROID PATIENT.

(1) The onset of action of T_4 is gradual. It has a long in vivo "half-life" of over six days. (Occasional missed doses or accidental double-doses are of les concern because of this factor)[1]; (2) since SYNTHROID contains onl T_4, the potential for metabolic surges traceable to more potent iodides (T_3) is eliminated.

AS WITH ANY THYROID PREPARATION, CAUTIOUS OBSERVATION OF THE PATIENT DURING THE BEGINNING OF THERAPY WILL ALERT THE PHYSICIAN TO ANY UNTOWARD EFFECTS.

Side effects, when they do occur are related to excessive dosage. Caution should be exercised in administering the drug to patient with cardiovascular disease. Rea the accompanying prescribing information for additional data o write Flint Laboratories.

synthetic thyroid drugs,
IROID is the most
nical to the patient.

WHY DOES SYNTHROID COST LESS THAN SYNTHETIC DRUGS CONTAINING T_3?

Very simple. T_3 costs more to make synthetically than does T_4. So it is economically necessary for a synthetic thyroid medication containing T_3 to cost more than one containing T_4 alone. Synthetic combinations cost patients nearly 50% more than SYNTHROID[3] because the T_3 costs more to start with; also there is the additional expense of formulating a tablet containing two active ingredients.

Address ____________________

City ____________ State ____________ Zip ____________

Indications: SYNTHROID (sodium levothyroxine) is specific replacement therapy for diminished or absent thyroid function resulting from primary or secondary atrophy of the gland, congenital defect, surgery, excessive radiation, or antithyroid drugs. Indications for SYNTHROID (sodium levothyroxine) **Tablets** include myxedema, hypothyroidism without myxedema, hypothyroidism in pregnancy, pediatric and geriatric hypothyroidism, hypopituitary hypothyroidism, simple (nontoxic) goiter, and reproductive disorders associated with hypothyroidism. SYNTHROID (sodium levothyroxine) **for Injection** is indicated for intravenous use in myxedematous coma and other thyroid dysfunctions where rapid replacement of the hormone is required. The injection is also indicated for intramuscular use in cases where the oral route is suspect or contraindicated due to existing conditions or to absorption defects, and when a rapid onset of effect is not desired.

Precautions: As with other thyroid preparations, an overdosage may cause diarrhea or cramps, nervousness, tremors, tachycardia, vomiting and continued weight loss. These effects may begin after four or five days or may not become apparent for one to three weeks. Patients receiving the drug should be observed closely for signs of thyrotoxicosis. If indications of overdosage appear, discontinue medication for 2-6 days, then resume at a lower dosage level. In patients with diabetes mellitus, careful observations should be made for changes in insulin or other antidiabetic drug dosage requirements. If hypothyroidism is accompanied by adrenal insufficiency, as Addison's Disease (chronic subcortical insufficiency), Simmonds's Disease (panhypopituitarism) or Cushing's syndrome (hyperadrenalism), these dysfunctions must be corrected prior to and during SYNTHROID (sodium levothyroxine) administration. The drug should be administered with caution to patients with cardiovascular disease; development of chest pains or other aggravations of cardiovascular disease requires a reduction in dosage.

Contraindications: Thyrotoxicosis, acute myocardial infarction. **Side effects:** The effects of SYNTHROID (sodium levothyroxine) therapy are slow in being manifested. Side effects, when they do occur, are secondary to increased rates of body metabolism; sweating, heart palpitations with or without pain, leg cramps, and weight loss. Diarrhea, vomiting, and nervousness have also been observed. Myxedematous patients with heart disease have died from abrupt increases in dosage of thyroid drugs. Careful observation of the patient during the beginning of any thyroid therapy will alert the physician to any untoward effects.

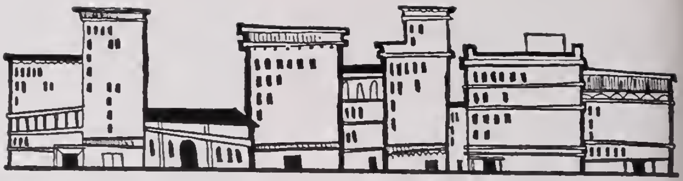
In most cases with side effects, a reduction of dosage followed by a more gradual adjustment upward will result in a more accurate indication of the patient's dosage requirements without the appearance of side effects.

Dosage and Administration: The activity of a 0.1 mg. SYNTHROID (sodium levothyroxine) TABLET is equivalent to approximately one grain thyroid, U.S.P. Administer SYNTHROID tablets as a single daily dose, preferably after breakfast. In hypothyroidism without myxedema, the usual initial adult dose is 0.1 mg. daily, and may be increased by 0.1 mg. every 30 days until proper metabolic balance is attained. Clinical evaluation should be made monthly and PBI measurements about every 90 days. Final maintenance dosage will usually range from 0.2-0.4 mg. daily. In adult myxedema, starting dose should be 0.025 mg. daily. The dose may be increased to 0.05 mg. after two weeks and to 0.1 mg. at the end of a second two weeks. The daily dose may be further increased at two-month intervals by 0.1 mg. until the optimum maintenance dose is reached (0.1-1.0 mg. daily).

Supplied: Tablets: 0.025 mg., 0.05 mg., 0.1 mg., 0.15 mg., 0.2 mg., 0.3 mg., 0.5 mg., scored and color-coded, in bottles of 100, 500, and 1000. Injection: 500 mcg. lyophilized active ingredient and 10 mg. of Mannitol, N.F., in 10 ml. single-dose vial, with 5 ml. vial of Sodium Chloride Injection, U.S.P., as a diluent. SYNTHROID (sodium levothyroxine) for Injection may be administered intravenously utilizing 200-400 mcg. of a solution containing 100 mcg. per ml. If significant improvement is not shown the following day, a repeat injection of 100-200 mcg. may be given.

FLINT LABORATORIES
DIVISION OF TRAVENOL LABORATORIES, INC
Morton Grove, Illinois 60053

From the Medical Schools



WASHINGTON UNIVERSITY

Expansion has begun on the Irene Walter Johnson Institute of Rehabilitation in the Washington University Medical Center. Three new levels are being added to the two-story building at 509 South Euclid Ave. Cost for completing and equipping the new facility will be close to $2 million.

A major portion of the funds were contributed by St. Louis area families and corporations. A "roof lifting" ceremony and reception on April 21 honored these donors.

Additionally, $340,000 was received through a Federal grant made under terms of the Hill-Burton Act. The Detroit-based Kresge Foundation provided $100,000.

Coordinator for the planning and the expansion has been *Hugh Chaplin, Jr.*, M.D., Kountz Professor of Preventive Medicine. Dr. Chaplin was director of the Institute from 1964 until 1972.

Edward B. Mower, Jr. served as chairman of the committee to raise money for the project, and *James Lee Johnson* and *Chapin Newhard* were committee co-chairmen.

In addition to expanding the present occupational and physical therapy facilities, the new structure will provide space for several new or enlarged programs or both.

On the top level will be a 1/26th-mile track, four lanes wide, which will be used in coronary and respiratory disease rehabilitation. The fourth level will contain the biomedical engineering laboratories, coronary rehabilitation facilities, the hand rehabilitation center, an orthotics (special braces) service and development unit and the brace/amputee clinic and conference room.

Space for physical therapy on the third level will approximately double that being used presently. Particularly noticeable will be the enlargement of pediatric facilities and the provision of areas for rehabilitational nursing, treatment and counseling. The occupational therapy activities will be continued on the second floor, and this too will have more space. Changes of note on the lower level include specialized speech therapy rooms, a larger library with adjoining conference room, and expanded administrative offices.

Thirty-seven of the 97 members in Washington University School of Medicine's 1973 graduating class began practice in St. Louis hospitals after receiving the M.D. degree on May 25.

Fourteen will begin internships at Barnes Hospital, 11 at The Jewish Hospital of St. Louis, eight at St. Louis Children's Hospital, three at St. John's Mercy Hospital and one at St. Luke's Hospital. The other 60 are going to 48 hospitals in 22 states, the District of Columbia and Canada. All appointments were arranged by the National Intern and Resident Matching Program.

ST. LOUIS UNIVERSITY

The Institute for Molecular Virology at the St. Louis University School of Medicine has been awarded $1,060,000 from the National Cancer Institute of the National Institutes of Health for the construction of a new research building. The laboratories in this building will be of special design with very sophisticated equipment for the study of potential cancer producing viruses isolated from humans and other primates. Construction is scheduled for completion some time in June, 1973. The Institute, directed by *Dr. Maurice Green,* lifetime NIH career awardee, is located at the corner of Spring and Park Avenues.

HEW's National Cancer Institute has announced the membership of two ad hoc subcommittees to review research programs conducted under the National Cancer Program. Dr. Maurice Green is one of the 12 members of the Ad Hoc Advisory Subcommittee for the Frederick Cancer Research Center.

The subcommittee of which Dr. Green is a member is reviewing a research program conducted by Litton Bionetics, Inc., at the Frederick Cancer Research Center, Fort Detrick, Frederick, Md. Litton's program performance will be examined and recommendations made for further development of an advanced systems laboratory at Frederick. This will serve as a sophisticated resource for experiments by visiting U. S. and foreign scientists. The other subcommittee of 11 scientists is reviewing overall research of the NCI Special Virus Cancer Program and making recommendations for future virus-cancer research.

Subcommittee members were selected by the National Cancer Advisory Board, a group of 23 cancer experts appointed last year by President Nixon. The Board advises and assists the Director of the NCI in administering the National Cancer Program.

The children's clinic conducted annually by the *Phi Delta Epsilon Fraternity* of the School of Medicine and *Morro House Club*, a group of St. Louis University undergraduate students, was held at the St. Louis Veterans Hospital (John Cochran Veterans Administration Hospital) on April 7.

Senior and junior medical students conducted physical examinations on about 95 grade school children who reside in the North St. Louis area. They performed the physicals under the guidance and assistance of graduate physicians.

Physicians cooperating in the student project included *Dr. Raymond G. Slavin*, associate professor of internal medicine; *Dr. Simon Horenstein,* chairman, Department of Neurology; *Dr. Murray Chinsky*, a private practitioner; and *Dr. Herman Shyken*, instructor in radiology.

Dr. V. L. Willman, professor and chairman of the Department of Surgery at the School of Medicine, is secretary of the AΩA Beta Chapter of Missouri.

Dr. Robert H. Felix, dean, School of Medicine, addressed the St. Louis Public Relations Hospital Association on Health Care on April 5. The luncheon meeting hosted by the St. Louis University Medical Center Public Relations Department was held in the President's Dining Room of Busch Memorial Center.

UNIVERSITY OF MISSOURI-COLUMBIA

Dr. Owen J. Koeppe, chairman of the Faculty Council and the Department of Biochemistry, has been named provost for academic affairs at the University of Missouri effective August 1.

Dr. Koeppe will replace *Dr. Clifton Cornwell,* who has held the post on a temporary basis since it was created last fall and who has indicated he does not want to serve as permanent provost.

Dr. Koeppe has been on the University faculty since 1955, a member of the Faculty Council since 1962 and chairman since 1970.

Three professors and two house staff members at the University Medical Center were cited by medical students on April 25 for excellence in teaching. The "Golden Apple" awards were presented at the school's Spring Honors Convocation.

First year medical students chose *J. Harry Cutts,* Ph.D., associate professor of anatomy, to receive the coveted award. Second year students elected *Marcus Beck,* M.D., associate professor of pathology. *Dr. Elizabeth James,* assistant professor of pediatrics and head of the newborn nursery at the Medical Center, received the votes of the third and fourth year students now in clinical training. It was the first time a woman has been selected as the outstanding teacher.

Dr. Ronald Vander Molen, a fourth year resident physician in surgery, was cited for the second year in a row for excellence in teaching and *Dr. William Trumbower,* a first year resident in obstetrics and gynecology, also received an award for excellence.

Guest speaker for the Honors Convocation was *Dr. William A. Sodeman Sr.*, now president of the American College of Physicians, who was chairman of the Department of Medicine at Missouri University from 1953 to 1957. The lectureship honors Dr. M. D. Overholser, former chairman of the Anatomy Department in the School of Medicine.

Appointments of several replacement and new clinical faculty members for the School of Medicine have been announced by *Dr. William D. Mayer,* dean and director of the Medical Center.

Expanding patient loans in the new Columbia Veterans Administration Hospital have caused an increasing need for physicians in several areas of clinical medicine, Dr. Mayer said. All VA physicians hold faculty appointments in the Medical Center. Teaching programs for residents, interns, and medical students in the VA Hospital are under the direction of the School of Medicine.

Dr. Charles R. Peterson will arrive on June 1 to become professor and chairman of the Department of Physical Medicine and Rehabilitation at the Medical Center. Currently at Baylor University College of Medicine in Houston, Dr. Peterson will begin recruitment for additional faculty members in his specialty.

The departure in July, 1972, of a number of the faculty in PM&R coincided with the move of *Dr. Lester E. Wolcott,* department chairman, to the new medical school at Texas Tech in Lubbock. Several of the rehab staff accompanied him.

Since last fall, McHaney Hall, the University Medical Center's rehabilitation facility, has been undergoing a renovation and expansion program for additional facilities for the severely handicapped patients, stroke victims, amputees, paraplegics and quadraplegics. The enlarged facility is expected to be completed in 1974.

The creation of a new division of pulmonary diseases within the VA Hospital and the Department of Medicine at the Medical Center will bring *Dr. Kaye Kilburn* to Missouri from Duke University to be chief of this medical specialty. Also coming from Duke University is *Dr. Daniel J. Hurst,* who will be on Dr. Kilburn's staff.

Dr. James H. Butt, II, whose specialty is in gastroenterology, will also join the Department of Medicine faculty June 1. Dr. Butt currently is on the faculty at Western Reserve in Cleveland. An ophthalmologist, *Dr. Waseem Kamal,* who trained at King Edward Medical College in Pakistan and at the University of Florida Medical Center, joined the faculty here in March.

Another new appointee is *Dr. Anthony Ferro,* a psychiatrist who came to Columbia from private practice in St. Louis. He was graduated from Havana University Medical School in 1949.

Missourians Attend AMA Leadership Conference

Missouri was well represented at the recent AMA Leadership Conference at the Marriott Hotel in Chicago. *(Left to right)* Dr. Vencel W. Hollo of St. Louis, consultant for St. Louis Blue Cross, visits with five of the representatives of the Missouri State Medical Association who attended the meeting—Dr. Donald Judd, St. Louis, Treasurer; Dr. Louis P. Hetlage, Troy, Fourth District Councilor; Mr. Raymond McIntyre, Executive Secretary; Dr. E. A. Stricker, St. James, President; and Dr. R. Allen Chandler, Kansas City, Chairman of the MSMA Council. *(Photo courtesy of Hallister S. Smith.)*

in Brief

A summary of AMA, medical & health news

American Medical Association/535 North Dearborn Street/Chicago, Illinois 60610/Phone (312) 527-1500/TWX 910-221-0300

A formal planning system will be established by the AMA beginning in 1974. The system was designed by the Batelle Research and Development Laboratories, Columbus, O., and was recommended to the Board of Trustees by the Council on Long Range Planning and Development. The overall plan will be prepared by the Board and submitted to the House of Delegates for approval or modification at the 1973 Clinical Convention. The system, which will relate all AMA activities to specified goals, will enable the AMA to sense change, sharpen objectives, create mechanisms for measuring progress, improve communications and improve the allocation of resources.

Two new insurance programs are planned for AMA members. Negotiations are proceeding on a group hospital indemnity plan and an accidental death and dismemberment plan. The AMA's entire insurance program, which includes group term life and excess major medical policies, is available to qualified medical students and interns and residents. Coverage for students ends at graduation unless the student becomes an AMA member. Coverage for interns and residents is contingent upon AMA membership. Physicians can receive quick information on the group life and excess major medical programs by calling the program administrator, Marsh & McLennan, Inc., on a Wats free line (800) 621-0366.

Practice management workshops will be offered by the AMA across the country this year and in 1974. The AMA will make its workshop program available to state medical societies and will assist the state societies in conducting the training sessions for young physicians planning to go into private practice. Ten workshops will be available in 1973 and 20 next year. The AMA recently completed an experimental series of six such workshops at AMA Headquarters. Workshops will be limited to 25 participants and registration fees of $35 for AMA members and $60 for non-members will be charged. Direct inquiries to Dept. of Practice Management, AMA Headquarters.

AMA officers and trustees will visit 22 state medical association annual meetings between May and October. Since the visitation program began one year ago, officers and Board of Trustees members have received invitations from every state association. The goal of the project is to gain insight into the problems of physicians through face-to-face visits, obtain recommendations on how to solve the problems and describe AMA activities. Since mid-February, AMA officials have visited 18 state association meetings.

A committee to study future housing needs of the AMA and to consider the appropriate location of AMA facilities was created by the Board of Trustees. Named to the committee were Trustees John M. Chenault, M.D., chairman, and Max H. Parrott, M.D.; Delegates James M. Blake, M.D., New York, and John G. Morrison, M.D., California; and Vice-Speaker of the House Tom E. Nesbitt, M.D. Dr. Chenault said the Board continues to hear comment about the merits of Chicago and Washington, D. C., as the site for AMA Headquarters.

A new award, the Brookdale Award in Medicine, will be presented by the AMA June 24 at the Annual Convention. The $5,000 cash award is made possible through the personal generosity of Arnold Schwartz, president of the Brookdale Foundation in New York City, and his wife, Marie. It will be given to a physician who is under 50 years of age and has made outstanding contributions to medical research, teaching or clinical practice.

Expenditures for health care totaled $83,417,000,000 in 1972, according to statistics published in 73 *Socioeconomic Issues of Health,* the "blue book" of the AMA's Center for Health Services Research and Development. Of the total spending, $77,291,000,000 went for hospital care and $32,460,000,000 went for physicians' services. Per capita expenditures in 1972 were $153.38 for hospital care and $76.31 for physicians' services. Copies of the book will be available for purchase at the Annual Convention in New York.

Aneurysm of Superior Mesenteric Artery

Case Report of Successful Repair

On the basis of autopsy studies,[1,2] as well as recent reviews of the literature,[3–5] clinically significant aneurysms of the superior mesenteric artery (SMA) are rare. They constitute approximately 15% to 20% of all the splanchnic artery aneurysms. At least 91 cases of superior mesenteric artery aneurysm have been reported, yet only 13 patients, including the one reported here, have been successfully treated.[3,5–7] Considering the etiology, 55% of the reported cases have been mycotic in origin, while those caused by arteriosclerosis, trauma and medial degenerative processes have occurred less frequently. Syphilitic aneurysms, which accounted for some of the earlier cases, have not been reported in the recent literature.

There is ample evidence that early and accurate diagnosis of this condition, as well as other splanchnic artery aneurysms, is mandatory if the patient is to be successfully treated. We report this case because of the unusual size of the aneurysm and because its true nature was not appreciated at the time of initial exploratory laparotomy. We particularly wish to emphasize the usefulness of selective arteriography both in the preoperative evaluation and the postoperative follow up and to demonstrate the value of aneurysmorrhaphy in the successful management of this serious problem.

Case Report

On March 25, 1972, a 57-year-old white man was transferred to Barnes Hospital. He was referred for treatment of an adbominal aortic aneurysm revealed at exploratory laparotomy two days earlier. The patient had enjoyed good health all of his life until approximately five days prior to his initial hospitalization when he began to have constant, dull, low anterior chest pain, which was noted particularly when he was in the sitting position and which was accompanied by mild shortness of breath and diaphoresis. The admission diagnosis of myocardial infarction was not substantiated; electrocardiogram, white blood cell count and enzymes were all normal. While he was in the hospital, an abdominal component to the pain developed and a small, discrete mass, which was not present at the time of admission to the hospital, was noted in the right upper abdomen. Exploratory laparotomy was performed to evaluate the abdominal mass, which was found to be an upper abdominal aortic aneurysm. Because

In reporting this case of an aneurysm of unusual size of the superior mesenteric artery, the authors emphasize the usefulness of selective arteriography in defining the site of origin preoperatively as well as in assessing the adequacy of surgical repair postoperatively. They also discuss relative incidence, etiology and surgical approach. Dr. Stanley is from the Mallinckrodt Institute of Radiology and Dr. Jaffe is from the Department of Surgery, Washington University School of Medicine.

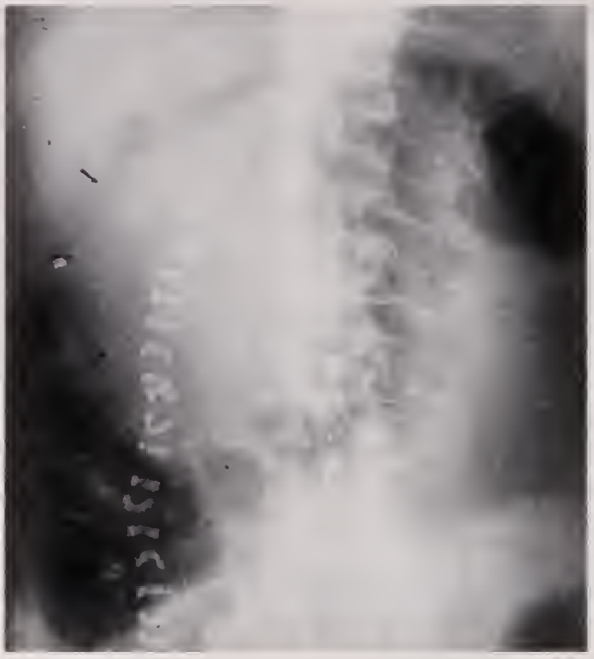

Fig. 1 AP supine film of abdomen demonstrates a large, rounded mass in the right upper quadrant displacing the antrum, duodenum and colon. Curvilinear circumferential calcification is noted *(arrow)* along the lateral margin of the mass. Skin clips are present from the initial exploratory laparotomy.

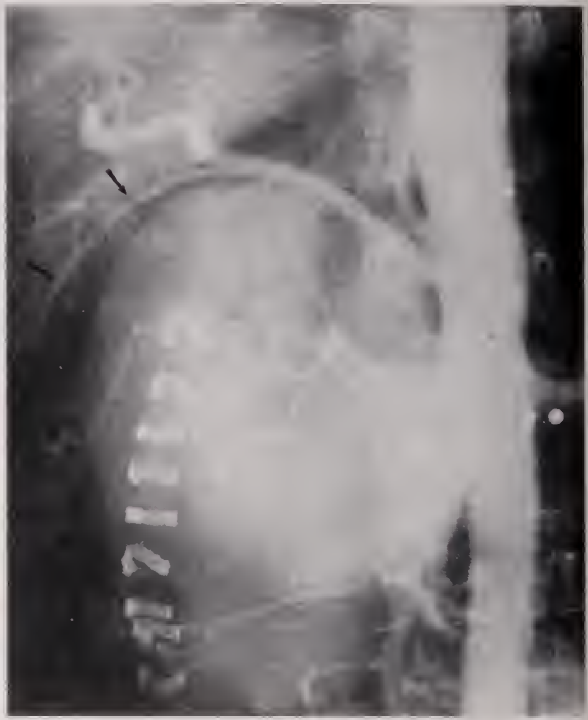

Fig. 2 Midstream aortogram demonstrates opacification of the right upper quadrant mass with the contrast, confirming that it is an arterial aneurysm. Note the marked stretching and lateral displacement of the common hepatic and gastroduodenal arteries *(arrows)*. The superior mesenteric artery appears slightly displaced, but is otherwise intact. The feeding vessel is not readily apparent from this study.

of its location, no attempt was made to repair the aneurysm. During the two postoperative days, the mass increased progressively in size and the patient was transferred to Barnes Hospital.

On admission to Barnes, the patient complained of persistent abdominal pain and upper back pain with radiation to the left subscapsular region. Physical examination revealed a 7 cm x 7 cm pulsatile upper abdominal mass with a loud bruit. Femoral and pedal pulses were normal. An electrocardiogram on the day of admission was normal. The hemoglobin level was 9 gm/100 ml, the hematocrit reading was 30% and the white blood cell count was 10,200/cu mm. The serum electrolytes and blood urea nitrogen were within normal limits, but the bilirubin, alkaline phosphatase and serum glutamic oxaloacetic transaminase were minimally elevated. A supine and cross table lateral view of the abdomen revealed a rounded mass in the right upper quadrant displacing the bowel anteriorly. A thin rim of calcification could be seen in the AP film (Fig. 1), but it was not visible in the lateral view.

During the next two days, the mass rapidly increased in size, necessitating emergency diagnostic studies and treatment. A midstream aortogram (Fig. 2) demonstrated a large saccular aneurysm to the right of the abdominal aorta producing marked stretching of the common hepatic and gastric duodenal arteries as well as slight postero-lateral displacement of the superior mesenteric artery. With the exception of the stretching and displacement, both the celiac and superior mesenteric arteries appeared otherwise intact. Initial attempts to selectively catheterize the celiac and superior mesenteric arteries were unsuccessful. However a selective catheter was finally positioned directly into the origin of the saccular aneurysm in the general area of the SMA (Fig. 3). A careful hand injection clearly demonstrated that the origin of the aneurysm was from either a small branch artery off the right lateral wall of the aorta or the proximal SMA itself.

The patient was immediately transferred to the operating room where an exploratory laparotomy was performed by employing a wide transverse subcostal incision. A large pulsatile mass approximately 11 cm in diameter was found posterior to the pancreas and stretching the pancreas over its surface. A left-sided approach was employed following splenectomy and mobilization of the left colon and the tail and body of the pancreas. No direct communication of the aneurysm with the abdominal aorta could be found. Nontraumatic clamp occlusion of the SMA produced a loss of pulsation in the aneurysm as well as in the peripheral branches of the SMA. It was presumed, therefore, that the aneurysm arose either directly from the lateral wall of the proximal SMA or from a small proximal branch, possibly the

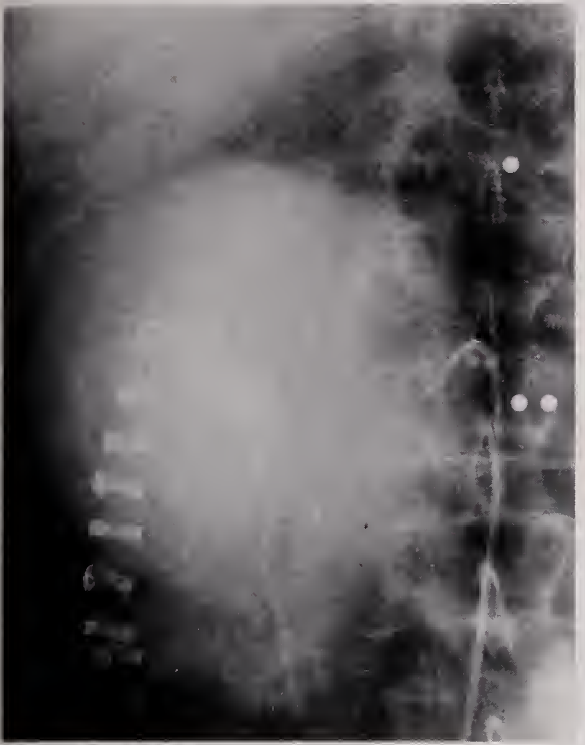

Fig. 3 A selective catheter with its tip in the general area of the origin of the superior mesentric artery (SMA) directs the contrast into the lumen of the saccular aneurysm without opacifying any portion of the feeding branch. Localization of the origin of the aneurysm was felt to be sufficiently well-defined to obviate the need for further injections.

inferior pancreaticoduodenal.

Following occlusion of the origin of the SMA, the aneurysm was directly incised and a 3 mm opening into the base of the aneurysm was identified. This aperture was suture ligated from within and the bulk of the aneurysmal wall was excised. After completion of the aneurysmorrhaphy and release of the occlusive clamp, adequate blood flow to the small bowel and proximal colon was demonstrated. Prior to the resection the aneurysm had stretched and compressed the portal vein over its wall so tightly that there was no evidence of flow through the portal system. Following repair, portal venous flow was restored. Bacterial and fungal cultures of the wall of the aneurysm were negative, and the gross and histologic appearance was typical of an arteriosclerotic aneurysm.

The patient tolerated the operative procedure remarkably well. With the exception of a transient and unexplained rise in serum bilirubin and alkaline phosphatase, his postoperative course was uneventful. The patient was discharged on the 13th postoperative day, at which time his serum alkaline phosphatase was still elevated but the serum bilirubin was approaching a normal level.

One month following discharge, the patient returned for follow up studies. A repeat aortogram (Fig. 4) and selective superior mesenteric arteriogram (Fig. 5) demonstrated that the common hepatic and gastroduodenal arteries had returned to a normal position. There were minimal irregularities

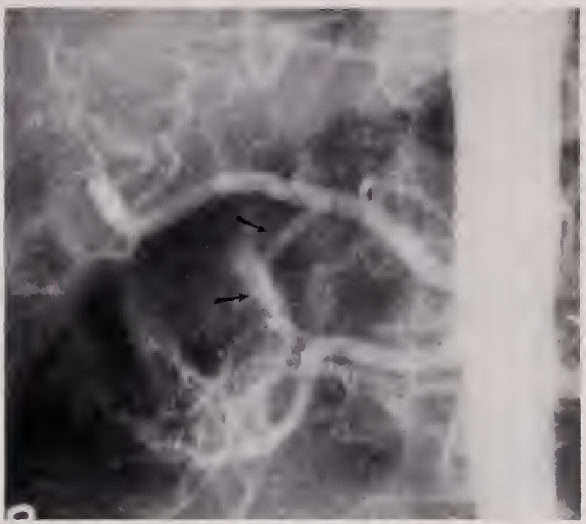

Fig. 4 Right upper quadrant detail from the postoperative midstream aortogram demonstrates a return of the common hepatic and gastroduodenal arteries *(arrows)* to a more normal anatomic position. No evidence of persistent aneurysm is seen.

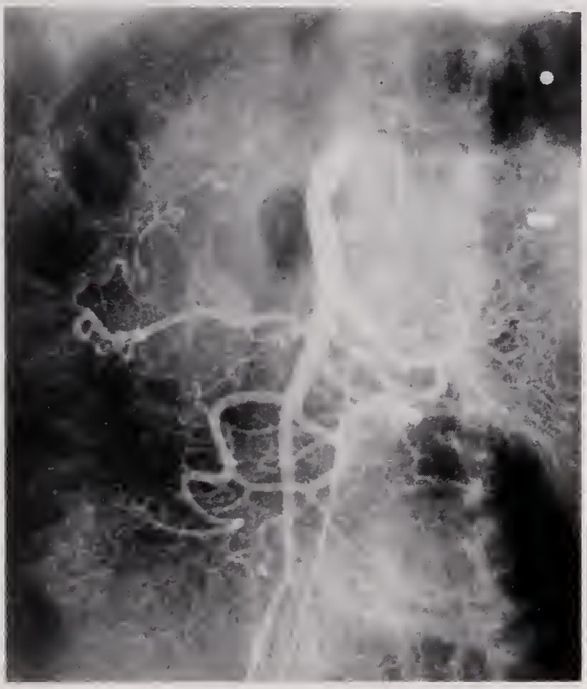

Fig. 5 Selective injection of the SMA demonstrates slight irregularity of the proximal lumen and an absence of branches on the right side proximal to the origin of the common right colic and middle colic artery. Again, no evidence of opacification of an aneurysm is seen.

in the right lateral wall of the proximal SMA without evidence of stenosis or recurrence of the aneurysm. The patient was free of symptoms and all blood chemistry values were now within normal limits.

Discussion

The diagnosis of a splanchnic artery aneurysm is difficult without the benefit of plain film radiography and selective arteriography. While curvilinear calcification in a mass is suggestive of an arterial aneurysm, it can not be considered diagnostic. The incomplete ring of circumferential calcification in the lateral view of the abdomen, which Weidner *et al*[8] consider to be presumptive evidence of an aneurysm of the SMA or celiac axis, was not visible in this case. The midstream abdominal aortogram demonstrated the general location and nature of this aneurysmal mass, but failed to define the feeding vessel. The somewhat fortuitous placement of the selective catheter directly into the lumen of the saccular aneurysm pinpointed the site of origin sufficiently to allow the direct surgical approach which was employed. The aortogram also excluded the possibility of multiplicity, a common feature of the splanchnic artery aneurysms.[9]

In contrast to some of the cases reported, this patient's symptoms were of relatively short duration and suggested primary chest or cardiac disease. While this patient's aneurysm was undoubtedly present for a long time, it remained essentially asymptomatic until the time of rapid increase in size and impending rupture. In addition, this patient had little, if any, clinical or radiographic evidence of significant atherosclerotic disease elsewhere. It is clear that the aneurysm was not mycotic in origin. Routine and fungal cultures were negative. Histologically, atherosclerosis was present in the wall of the aneurysm. None-the-less, a medial degenerative process could have the same final histologic appearance. So, it is impossible to determine which was the primary disease process. In many of the cases reported, atherosclerosis is presumed to be the etiology primarily because it is present in the specimen at the time of surgery or autopsy. As discussed by Stanley *et al*[5] a medial degenerative process may possibly be more common as the primary etiology of visceral artery aneurysms than the current literature would suggest.

Summary

An aneurysm of the superior mesenteric artery of unusual size is reported. Emphasis is placed on the usefulness of selective arteriography in defining the site of origin preoperatively as well as assessing the adequacy of surgical repair postoperatively. Relative incidence, etiology and surgical approach are discussed.

A Seminar on Therapeutics with major emphasis on *how* drugs should be used is scheduled at the Crown Center Hotel in Kansas City on June 14-15. Sponsors of the program are the University of Missouri-Kansas City School of Medicine and the Division for Continuing Education, the Kansas City Southwest Clinical Society, the Missouri Regional Medical Program and The Academy of Health Professions.

The subject matter to be discussed includes "Digitalis: an Electrophysiologic Approach to Detection and Management of Arrhythmias" and the "Characterization and Management of Hypertension." Outstanding guest faculty are Gordon A. Ewy, M.D., Associate Professor of Medicine, University of Arizona College of Medicine; Charles Fisch, M.D., Professor of Medicine and Director of the Cardiovascular Division, Indiana University School of Medicine; and John H. Moyer, III, M.D., D.Sc., Professor of Medicine, the Hahnemann Medical College.

For further information, write to The University of Missouri-Kansas City Division for Graduate Medical Education, 2220 Holmes St., Kansas City, Mo. 64108 or phone (816) 471-3876.

ntegument!

r skin—the human integument
:overs us, defines us, protects
But skin is subject to cuts,
rns, abrasions. And infections.
osporin Ointment fights
ection by providing broad
tibacterial action against sus-
ptible skin invaders. It contains
tibiotics that are rarely used
stemically, reducing the risk
sensitization.

INDICATIONS: *Therapeutically*, used as an adjunct to appropriate systemic therapy for topical infections, primary or secondary, due to susceptible organisms, as in: • infected burns, skin grafts, surgical incisions, otitis externa • primary pyodermas (impetigo, ecthyma, sycosis vulgaris, paronychia) • secondarily infected dermatoses (eczema, herpes, and seborrheic dermatitis) • traumatic lesions, inflamed or suppurating as a result of bacterial infection.

Prophylactically, the ointment may be used to prevent bacterial contamination in burns, skin grafts, incisions, and other clean lesions. For abrasions, minor cuts and wounds accidentally incurred, its use may prevent the development of infection and permit wound healing.

CONTRAINDICATIONS: Not for use in the external ear canal if the eardrum is perforated. This product is contraindicated in those individuals who have shown hypersensitivity to any of the components.

PRECAUTION: As with other antibiotic preparations, prolonged use may result in overgrowth of nonsusceptible organisms and/or fungi. Appropriate measures should be taken if this occurs. Articles in the current medical literature indicate an increase in the prevalence of persons allergic to neomycin. The possibility of such a reaction should be borne in mind.

Complete literature available on request from Professional Services Dept. PML.

EOSPORIN® Ointment

OLYMYXIN B-BACITRACIN-NEOMYCIN)

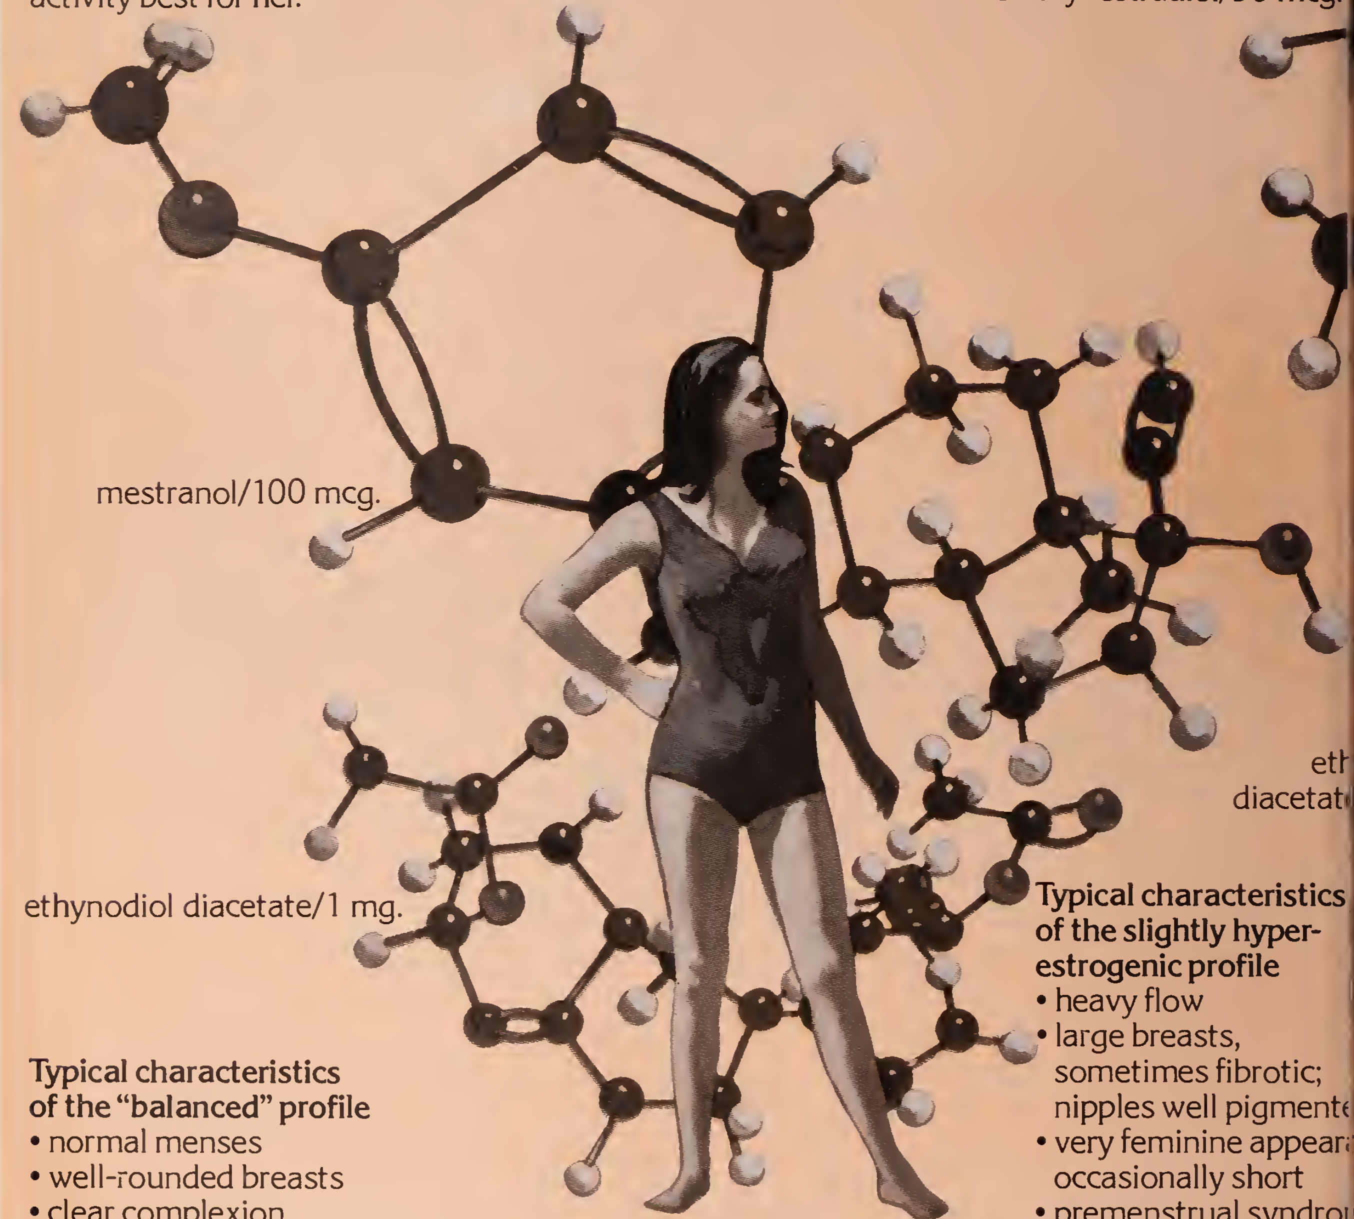
Each gram contains: Aerosporin® brand Polymyxin B Sulfate 5,000 units; zinc bacitracin 400 units; neomycin sulfate 5 mg. (equivalent to 3.5 mg. neomycin base); special white petrolatum q.s. In tubes of 1 oz. and ½ oz. and 1/32 oz. (approx.) foil packets.

Wellcome

Burroughs Wellcome Co.
Research Triangle Park
North Carolina 27709

What's in it for her?

All steroid molecules are not the same... in their activity. In prescribing birth-control pills, estrogen/progestogen activity is more important than milligrams. The woman's hormone profile often indicates the activity best for her.



ethinyl estradiol/50 mcg.
mestranol/100 mcg.
eth
diacetat
ethynodiol diacetate/1 mg.

Typical characteristics of the "balanced" profile

- normal menses
- well-rounded breasts
- clear complexion
- normal figure with normal secondary sex characteristics
- normal cytohormonal pattern

This "center spectrum" pill has had excellent user acceptance for over seven years.

Ovulen®

Available in 20-, 21- and 28-pill schedules
Each white tablet contains: ethynodiol diacetate 1 mg./mestranol 0.1 mg.
Each pink tablet in Ovulen-28® is a placebo containing no active ingredients.

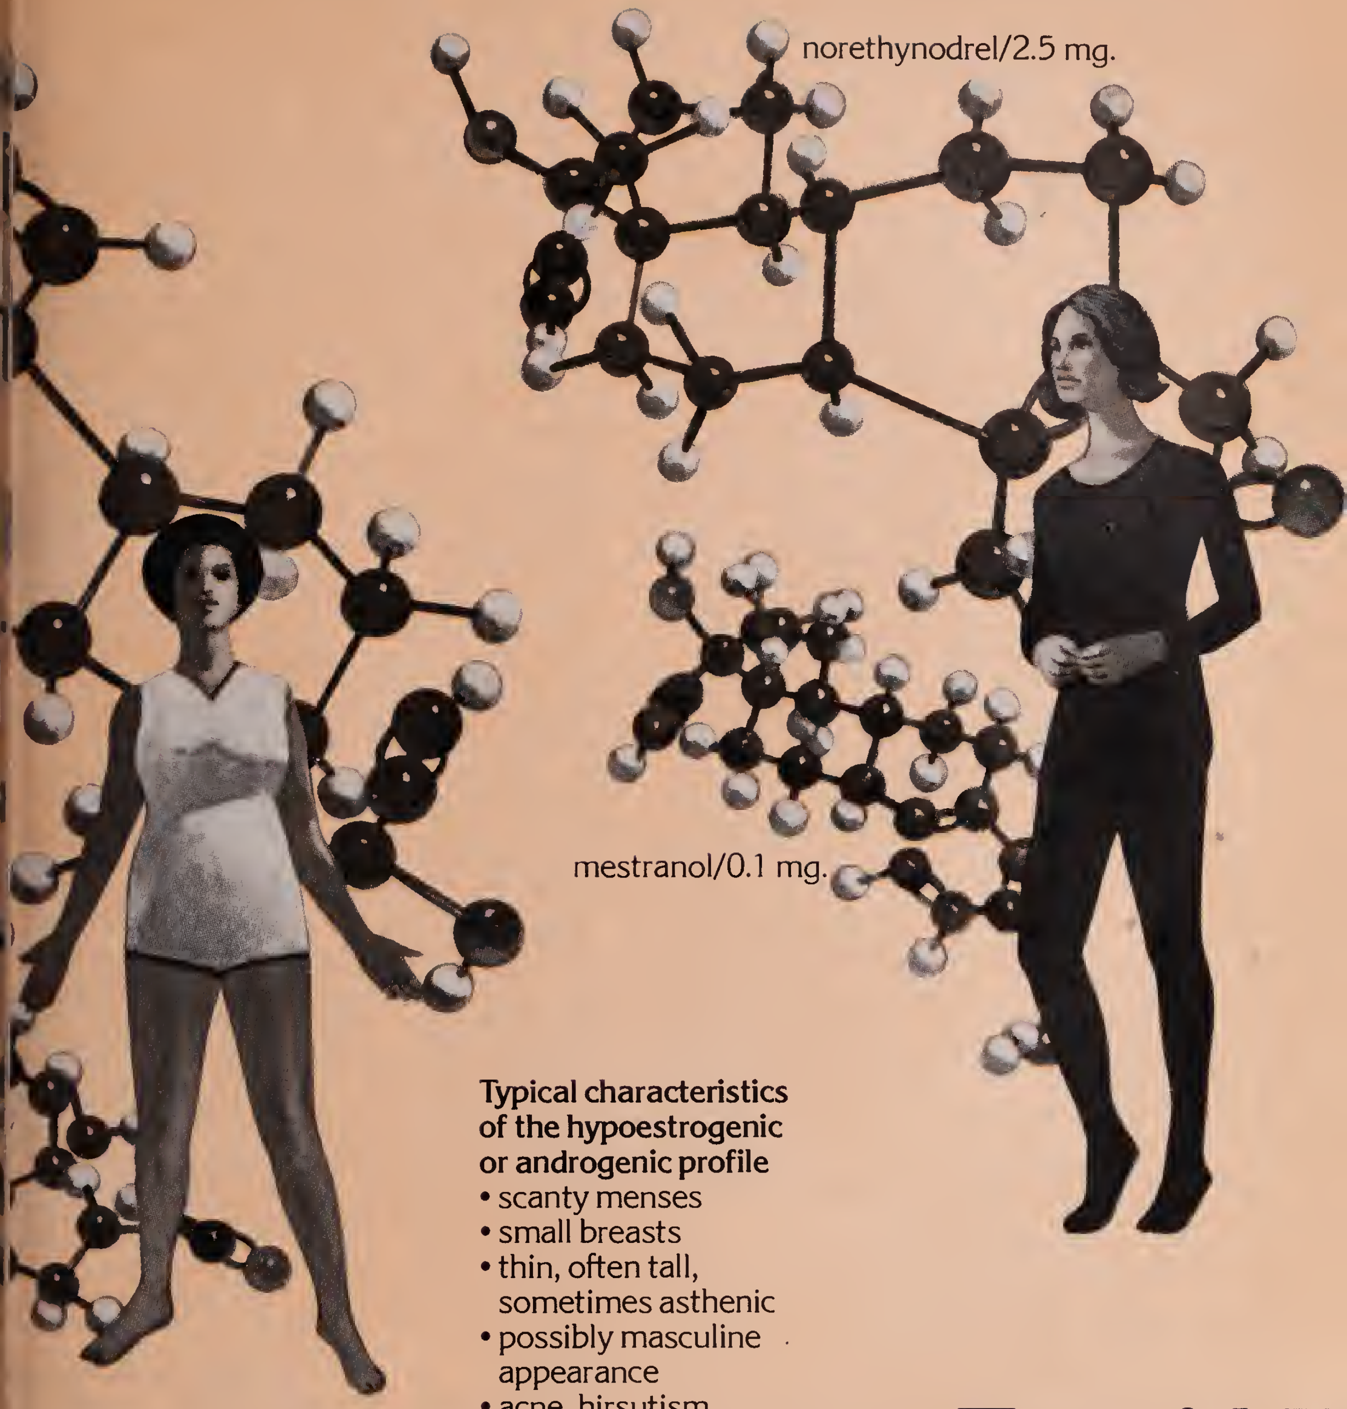
for the majority of women... when centrally balanced activity is preferred

Typical characteristics of the slightly hyper-estrogenic profile

- heavy flow
- large breasts, sometimes fibrotic; nipples well pigment
- very feminine appear occasionally short
- premenstrual syndro fluid retention
- tendency to uterine fibroids
- high pyknotic index

This formulation, whic less estrogenic activity a moderate progestoge dominance, may be a g beginning.

For brief summary of prescribing information, please see next page.



norethynodrel/2.5 mg.
mestranol/0.1 mg.

Typical characteristics of the hypoestrogenic or androgenic profile

- scanty menses
- small breasts
- thin, often tall, sometimes asthenic
- possibly masculine appearance
- acne, hirsutism
- low sexual motivation
- thin vaginal lining, tendency to vaginitis and dyspareunia

This pill has a relatively weak and unique* progestogen with inherent estrogenicity. Clinically, just as in animal studies, it appears not to possess antiestrogenic and androgenic activity.

emulen®

ilable in 21- and 28-pill schedules
h white tablet contains: ethynodiol
etate 1 mg./ethinyl estradiol 50 mcg.
h pink tablet in Demulen-28® is a
ebo containing no active ingredients.

ll suited to most women
ien low estrogenic activity
d moderate progestogen
minance are preferred

Enovid-E

Available in 20- and 21-pill schedules
Each tablet contains: norethynodrel
2.5 mg./mestranol 0.1 mg.

a clear choice for women when estrogen dominance and no androgenic activity are preferred

*Of all the progestogens, norethynodrel most resembles the molecular structure o the estrogens. It has the weakest progestational activity of any progestogen in a combination pill.

Ovulen®

Each white tablet contains:
ethynodiol diacetate 1 mg./mestranol 0.1 mg.

Demulen®

Each white tablet contains:
ethynodiol diacetate 1 mg./ethinyl estradiol 50 mcg.

Each pink tablet in Ovulen-28® and Demulen-28® is a placebo, containing no active ingredients.

Actions—Ovulen and Demulen act to prevent ovulation by inhibiting the output of gonadotropins from the pituitary gland. Ovulen and Demulen depress the output of both the follicle-stimulating hormone (FSH) and the luteinizing hormone (LH).

Special note—Oral contraceptives have been marketed in the United States since 1960. Reported pregnancy rates vary from product to product. The effectiveness of the sequential products appears to be somewhat lower than that of the combination products. Both types provide almost completely effective contraception.

An increased risk of thromboembolic disease associated with the use of hormonal contraceptives has now been shown in studies conducted in both Great Britain and the United States. Other risks, such as those of elevated blood pressure, liver disease and reduced tolerance to carbohydrates, have not been quantitated with precision.

Long-term administration of both natural and synthetic estrogens in subprimate animal species in multiples of the human dose increases the frequency of some animal carcinomas. These data cannot be transposed directly to man. The possible carcinogenicity due to the estrogens can be neither affirmed nor refuted at this time. Close clinical surveillance of all women taking oral contraceptives must be continued.

Indication—Ovulen and Demulen are indicated for oral contraception.

Contraindications—Patients with thrombophlebitis, thromboembolic disorders, cerebral apoplexy or a past history of these conditions, markedly impaired liver function, known or suspected carcinoma of the breast, known or suspected estrogen-dependent neoplasia and undiagnosed abnormal genital bleeding.

Warnings—The physician should be alert to the earliest manifestations of thrombotic disorders (thrombophlebitis, cerebrovascular disorders, pulmonary embolism and retinal thrombosis). Should any of these occur or be suspected the drug should be discontinued immediately.

Retrospective studies of morbidity and mortality conducted in Great Britain and studies of morbidity in the United States have shown a statistically significant association between thrombophlebitis, pulmonary embolism, and cerebral thrombosis and embolism and the use of oral contraceptives. There have been three principal studies in Britain[1-3] leading to this conclusion, and one[4] in this country. The estimate of the relative risk of thromboembolism in the study by Vessey and Doll[3] was about sevenfold, while Sartwell and associates[4] in the United States found a relative risk of 4.4, meaning that the users are several times as likely to undergo thromboembolic disease without evident cause as nonusers. The American study also indicated that the risk did not persist after discontinuation of administration and that it was not enhanced by long-continued administration. The American study was not designed to evaluate a difference between products. However, the study suggested that there might be an increased risk of thromboembolic disease in users of sequential products. This risk cannot be quantitated, and further studies to confirm this finding are desirable.

Discontinue medication pending examination if there is sudden partial or complete loss of vision, or if there is a sudden onset of proptosis, diplopia or migraine. If examination reveals papilledema or retinal vascular lesions medication should be withdrawn.

Since the safety of Ovulen and Demulen in pregnancy has not been demonstrated, it is recommended that for any patient who has missed two consecutive periods pregnancy should be ruled out before continuing the contraceptive regimen. If the patient has not adhered to the prescribed schedule the possibility of pregnancy should be considered at the time of the first missed period.

A small fraction of the hormonal agents in oral contraceptives has been identified in the milk of mothers receiving these drugs. The long-range effect to the nursing infant cannot be determined at this time.

Precautions—The pretreatment and periodic physical examinations should include special reference to the breasts and pelvic organs, including a Papanicolaou smear since estrogens have been known to produce tumors, some of them malignant, in five species of subprimate animals. Endocrine and possibly liver function tests may be affected by treatment with Ovulen or Demulen. Therefore, if such tests are abnormal in a patient taking Ovulen or Demulen, it is recommended that they be repeated after the drug has been withdrawn for two months. Under the influence of progestogen-estrogen preparations pre-existing uterine fibromyomas may increase in size. Because these agents may cause some degree of fluid retention, conditions which might be influenced by this factor, such as epilepsy, migraine, asthma, cardiac or renal dysfunction, require careful observation. In breakthrough bleeding, and in all cases of irregular bleeding per vaginam, nonfunctional causes should be borne in mind. In undiagnosed bleeding per vaginam adequate diagnostic measures are indicated. Patients with a history of psychic depression should be carefully observed and the drug discontinued if the depression recurs to a serious degree. Any possible influence of prolonged Ovulen or Demulen therapy on pituitary, ova
adrenal, hepatic or uterine function awaits further study. A decrea
glucose tolerance has been observed in a significant percentag
patients on oral contraceptives. The mechanism of this decrea
obscure. For this reason, diabetic patients should be carefully obse
while receiving Ovulen or Demulen therapy. The age of the patient
stitutes no absolute limiting factor, although treatment with Ovule
Demulen may mask the onset of the climacteric. The pathologist sh
be advised of Ovulen or Demulen therapy when relevant specin
are submitted. Susceptible women may experience an increas
blood pressure following administration of contraceptive steroids.

**Adverse reactions observed in patients receiving oral
traceptives**—A statistically significant association has been der
strated between use of oral contraceptives and the following ser
adverse reactions: thrombophlebitis, pulmonary embolism and
bral thrombosis.

Although available evidence is suggestive of an association, su
relationship has been neither confirmed nor refuted for the follo
serious adverse reactions: neuro-ocular lesions, e.g., retinal thr
bosis and optic neuritis.

The following adverse reactions are known to occur in pat
receiving oral contraceptives: nausea, vomiting, gastrointestinal sy
toms (such as abdominal cramps and bloating), breakthrough blee
spotting, change in menstrual flow, amenorrhea during and after t
ment, edema, chloasma or melasma, breast changes (tender
enlargement and secretion), change in weight (increase or decre
changes in cervical erosion and cervical secretions, suppressio
lactation when given immediately post partum, cholestatic jaun
migraine, rash (allergic), rise in blood pressure in susceptible individ
and mental depression.

Although the following adverse reactions have been reporte
users of oral contraceptives, an association has been neither
firmed nor refuted: anovulation post treatment, premenstrual
syndrome, changes in libido, changes in appetite, cystitis-like syndr
headache, nervousness, dizziness, fatigue, backache, hirsutism, lo
scalp hair, erythema multiforme, erythema nodosum, hemorrh
eruption and itching.

The following laboratory results may be altered by the use of
contraceptives: hepatic function: increased sulfobromophthalein re
tion and other tests; coagulation tests: increase in prothrombin, Fac
VII, VIII, IX and X; thyroid function: increase in PBI and butanol ext

Enovid-E®

**with estrogen-
dominant/
nonandrogeni
activity**

norethynodrel 2.5 mg./mestranol 0.1 mg.

Actions—Enovid-E acts to prevent ovulation by inhibiting the
put of gonadotropins from the pituitary gland. Enovid-E depresses
output of both the follicle-stimulating hormone (FSH) and the lu
izing hormone (LH).

Indication—Enovid-E is indicated for oral contraception.

The *Special Note, Contraindications, Warnings, Precautions*
Adverse Reactions listed above for Ovulen and Demulen are applic
to Enovid-E and should be observed when prescribing Enovid-E.

Successful Treatment of Insulin Resistance With Dealaninated Pork Insulin (DPI)

Case Report

In this case report of a 50-year-old woman with maturity onset diabetes mellitus who developed insulin resistance, unusual features include the patient's rapid response to dealaninated pork insulin (DPI) after failure to respond to pure pork insulin. The authors conclude that DPI is an agent useful in the treatment of insulin resistance. The authors are from the University of Missouri Medical Center. This study was supported by National Institutes of Health Grants 5 RO1 AM5316-09 and 5 RO1 AM 11265-03.

INSULIN RESISTANT is a term used in describing the nonacidotic diabetic patient requiring 200 units or more of insulin for at least several days.[1] The precise mechanism underlying this excessive insulin requirement is not known, but, presumably, binding of the exogenous insulin of animal origin by tissue or circulating antibodies is involved. A number of agents and methods have been used in the treatment of insulin resistance. These include oral hypoglycemic agents,[2] dimercaprol (BAL),[3] nitrogen mustard,[4] human insulin,[5] discontinuance of insulin and alternate day insulin administration. Sulfated insulin[6] and fish insulin[7] also have been used, but these are not commercially available in this country. In this case report, the patient had a dramatic response to dealaninated pork insulin (DPI) after being resistant to both commercially available beef-pork insulin and to pure porcine insulin.

CASE REPORT

History

A 50-year-old Negro woman was first admitted to the University of Missouri Medical Center in 1962 at which time the diagnosis of diabetes mellitus was made on the basis of fasting blood glucose levels persistently above 150 mg/100 ml, glycosuria and acetonuria. Initially, the patient had been given up to 25 units of NPH insulin, but, by the time of her discharge, the diabetic state had been well-controlled without insulin, with fasting blood glucose values of approximately 100 mg/100 ml. She was discharged with a 1,500 calorie diet composed of 140 gm of carbohydrate, 60 gm of fat and 97 gm of protein, and she was instructed to take 2 gm of tolbutamide per day. During the next six years, her weight remained stable at about 155 lb, she had no episodes of acidosis or hypoglycemic shock and her urine was usually negative for glucose. In May, 1968, treatment with 500 mg of chlorothiazide daily was started for the control of essential hypertension.

In January, 1969, the patient noted the onset of weakness, weight loss, anorexia, polyuria and polydipsia associated with 3 to 4+ glycosuria. She was hospitalized by her local physician who found no underlying cause for the change in her diabetic status. She was discharged on a regimen of 50 units of Lente insulin and 20 units of regular insulin in the morning and 20 units of Lente in the evening. She became aglycosuric and both her appetite and strength improved. However, she continued to lose weight and by April, 1969, she weighed 115 lb. She again experienced anorexia and weakness and noted that 3 to 4+ glycosuria had recurred. On April 25, 1969, she was readmitted to her local hospital where she was found to be confused and dehydrated and to have a blood glucose value of 500 mg/100 ml. One week later, in spite of receiving approximately 90 units of insulin (Regular and Lente) daily, the patient lapsed into deep coma with grand mal seizures. A blood glucose concentration of 1,015 mg/100 ml, serum bicarbonate of 5 mEq/l, blood pH of 7.02 and large amounts of acetone in the urine were reported. With intensive treatment including large amounts of regular insulin and approximately 3,000 cc of 5% dextrose in lactated Ringer's solution per day, the patient gradually improved. However, even after the acidosis had been corrected and the patient was again conscious and alert, she continued to require in excess of 200 units of Regular insulin daily (range of 180 to 270 units insulin) to maintain her blood glucose in the range of 300 to 350 mg 100 ml. Because of the persistent, unexplained insulin resistance, she was transferred to the University of Missouri Medical Center on May 14, 1969.

Physical Examination

At the time of admission, the patient was alert and afebrile; blood pressure was 140/70, pulse rate was 76 per minute and weight was 114 lb. Funduscopic examination revealed bilateral retinal microaneurysms and small dot hemorrhages in the left fundus. There were bilateral immature cataracts. Auscultation over the neck revealed bilateral carotid bruits. The apex impulse of the heart was shifted slightly to the left of the midclavicular line and auscultation revealed a Grade III/VI systolic ejection type murmur audible over the aortic area with radiation into the neck. There was no costovertebral angle tenderness. The remainder of the examination was within normal limits.

Laboratory Data

The hemoglobin level was 10.5 gm/100 ml; the hematocrit reading, 35%; white blood cell count, 6,100/cu mm with 66% neutrophils, 32% lymphocytes, 1% monocytes and 1% eosinophils; and reticulocyte count, 2.1%. A sickle cell preparation was negative. Urinalysis revealed a specific gravity of 1.020 with 2% glucose without albumin or acetone; microscopic: occasional red and white blood cells.

The initial blood glucose level was 318 mg/100 ml; electrolytes: sodium, 135 mEq/liter; potassium, 4.1 mEq/liter; chloride, 97 mEq/liter; bicarbonate, 25 mEq/liter; blood urea nitrogen (BUN) 12 mg/100 ml; serum creatinine, 1.1 mg/100 ml. Serum proteins were 1.9 gm/100 ml albumin and 3.8 gm/100 ml globulin. Total lipids were 763 mg/100 ml (normal, 450-1,000 mg/100 ml); triglycerides, 127 mg/100 ml (normal, 30-135 mg/100 ml, fasting); phospholipids, 250 mg/100 ml (normal, 125-300 mg/100 ml); and total cholesterol, 266 mg/100 ml. Electrocardiogram revealed left ventricular hypertrophy and left axis deviation. Chest film showed tortuosity of the thoracic aorta and a normal heart size.

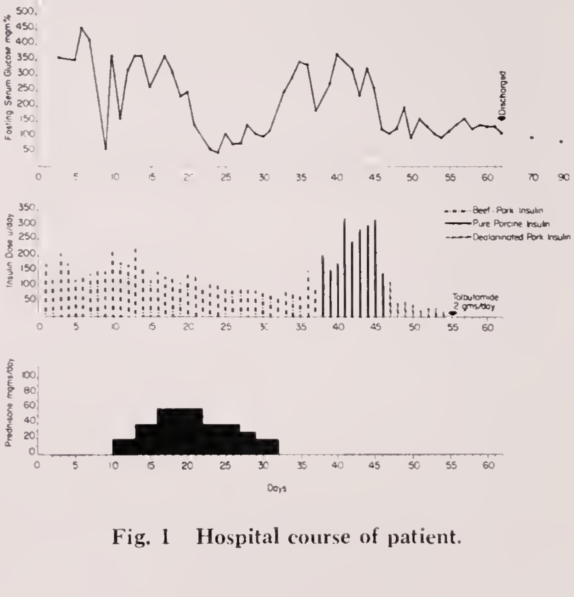

Fig. 1 Hospital course of patient.

Hospital Course

While searching for a cause to explain the apparent insulin resistance, diabetic control was attempted with two injections daily of mixtures of regular and NPH insulin. The dosage of insulin used and blood glucose values obtained are summarized in Fig. 1. It soon became apparent that the blood glucose of this patient could not be controlled with this regimen and she was treated with regular insulin only, four times per day. The dose was determined by the degree of glycosuria and acetonuria. However, even when she received more than 200 units of insulin, the urine showed persistent 5% glycosuria and moderate to large amounts of acetone. On the tenth hospital day, a regimen of prednisone was begun and, as the dose was increased to 60 mg daily, the insulin requirement and fasting blood glucose levels gradually decreased (Fig. 1). By the 13th day of prednisone treatment, the fasting blood glucose level was normal and the daily insulin dosage had been reduced to approimately 90 units per day. Between the 22nd and 32nd hospital days, prednisone dosage was gradually tapered and discontinued. Within four to five days after withdrawal of prednisone, insulin resistance recurred. The fasting serum glucose values exceeded 250 mg/100 ml with the patient requiring more than 100 units of beef-pork insulin daily. On the 38th hospital day, treatment with pure porcine insulin was instituted in an attempt to lower her insulin requirement. During the following nine days, while taking pork insulin, the patient's requirement averaged greater than 200 units per day with persistently elevated fasting blood sugars and glycosuria. Pure porcine insulin was discontinued and therapy with dealaninated pork insulin (DPI) was then begun. The response was dramatic. Within 48 hours, the insulin requirement fell to 40 units per day and the fasting serum glucose was 122 mg/100 ml (Fig. 1). The patient remained aglycosuric from the fourth day of DPI treatment throughout the rest of her hospitalization. The dose of DPI was cautiously reduced and then discontinued eight days after it had been started. Tolbutamide, 2 gm per day, was commenced on the 55th hospital day. On this dose, the patient had fasting blood glucose values of approximately 130 mg/100 ml and was without glycosuria. After more than a week of close observation on tolbutamide therapy, the patient was discharged.

During follow-up in the Outpatient Clinic, the patient has done well. She has felt well and has maintained her weight, and all her urine tests were negative for glucose and acetone. After discharge, fasting blood glucose values of 98 mg/100 ml and 82 mg/100 ml were noted at one and four weeks, respectively. Six months after discharge, the patient's diabetic status remains stable. Sera for insulin antibody determination and for pork insulin-binding capacity were drawn on the 48th hospital day and one and three weeks after discharge. Insulin antibodies were consistently present, and the binding capacities for pork insulin were reported as being above the highest standard with 320 units/liter in each sample examined.

Discussion

Insulin resistance is generally believed to be due to the presence of circulating antibodies which bind and inactivate insulin.[8] All patients receiving exogenous insulin eventually develop detectable titers of insulin antibodies in their sera.[9] In one study, insulin resistance was demonstrated to be directly related to the ability of the serum to bind insulin.[10] The plasma insulin-binding capacity of diabetics who are responsive to usual amounts of insulin is usually less than 20 units per liter, whereas insulin binding capacity in patients with insulin resistance is usually in excess of 50 units per liter.[11]

ACTH and corticosteroids have been efficacious in the treatment of insulin resistance and are thought to be effective because of their ability to diminish antibody formation.[12–14] Administration of these agents for longer than two weeks has been found to cause a decreased level of circulating antibodies.[15] However, it may take as long as four weeks for steroids to produce the desired result of reducing the insulin requirement in the insulin resistant patient.[16] The lowered insulin requirements may or may not persist after discontinuation of steroid therapy.[17] In the case presented, the patient responded favorably to prednisone therapy within two weeks, but the insulin resistance promptly recurred when prednisone was discontinued. Possibly, her insulin requirements would have remained low had prednisone been administered for a longer period of time.

Pork	threo	ser	ileu	ala
Dealaninated pork	threo	ser	ileu	ala

Pure porcine insulin has been an effective agent in the treatment of insulin resistance in some cases.[16, 18] Patients who respond to this agent usually do so within 24 to 48 hours.[18, 19] The rationale for the utilization of pure pork insulin is based on its structural similarity to human insulin. The structure of porcine insulin is depicted in Fig. 2, and the differences between human, bovine, porcine and dealaninated porcine insulin (DPI) are summarized in Table 1. Human and porcine insulin have identical structures except for the C terminal amino acid of the B chain.[15] Alteration of the insulin molecule has been undertaken in an effort to diminish its antigenicity while maintaining a high level of biologic activity. As illustrated schematically in Fig. 2, DPI is made by the enzymatic removal of the C terminal amino acid, alanine, from the B chain,[20] so that it is structurally identical to human insulin except that the latter has a threonine at the C terminal position on the B chain and the former has no amino acid in the 30 position. This removal of the C terminal alanine from the B chain does not alter the biologic activity of insulin.[21] Miller recently has suggested that the insulin antibodies to beef-pork insulin and to pure pork insulin do not cross-react with DPI. This implies that the presence of a C terminal alanine is instrumental in the production of insulin resistance.[22] If the A chain is primarily responsible for insulin antigenicity,[23] human insulin and DPI should be antigenically identical. It is possible, however, that the processing of pancreatic material alters insulin in some manner that ren-

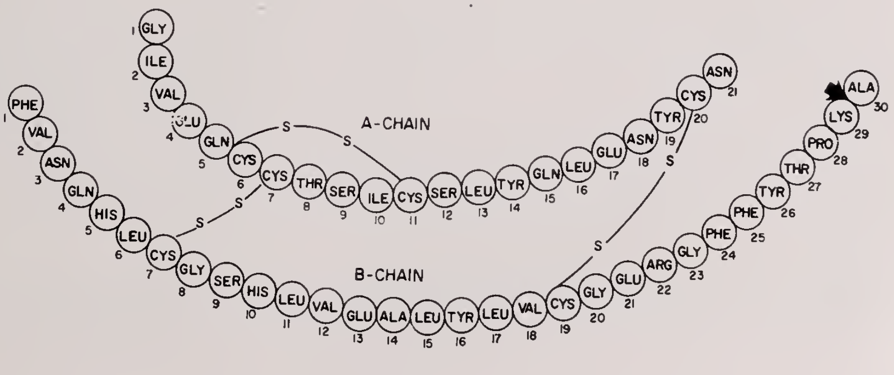

Fig. 2 Structure of porcine insulin. Arrow indicates site at which the C terminal alanine is removed to produce DPI.

ders it antigenic even for its own species.[24]

In spite of the theoretical advantage of DPI over pure pork insulin, the latter has been at least as effective in treating insulin resistance in the experience of some investigators.[15, 20] Boshell *et al*[25] have previously reported that three of seven insulin resistant patients responded equally favorably to human, porcine or DPI after being resistant to commercially available mixtures of bovine and pork insulin. Akre *et al*[20] made a similar observation in six of 11 insulin resistant patients treated with pure pork, DPI or human insulin.

The patient reported here, however, responded to DPI after failure to respond to pure porcine insulin. This dramatic response commenced within 48 hours after starting DPI and was manifested by a marked reduction in her daily insulin requirement from more than 200 units per day of pure pork insulin to 30 to 40 units per day of DPI and then to no insulin requirement. The usefulness of DPI treatment of insulin resistance with a patient unresponsive to pure pork insulin has been infrequently emphasized.[22] We believe this agent should be employed more frequently in this condition.

There are several interesting aspects of this case which merit further comment. For example, we do not know why, after seven years of good control with tolbutamide, the patient's diabetic status changed so that she required insulin in increasingly large doses, went into a severe episode of ketoacidosis and was resistant to insulin after this episode. Equally puzzling is the remarkable reversal of this sequence commencing within 48 hours after DPI was commenced. The patient's insulin requirement not only decreased but disappeared so that her diabetic status was comparable to that which existed before January, 1969. That the insulin treatment in 1962 might have influenced the development of her insulin resistance is a possibility upon which one can only speculate. Since we do not know what events initiated her resistance and because immunologic insulin resistanee may be manifested as an anamnestic response, insulin resistance could well recur in this patient.

SUMMARY

The case report of a 50-year-old woman with maturity onset diabetes mellitus who developed insulin resistance is presented. Prednisone treatment diminished the patient's insulin requirements significantly, but the insulin resistance recurred after discontinuation of prednisone. The patient failed to respond to pure porcine insulin but responded dramatically to dealaninated pork insulin (DPI), and she ultimately was controlled on diet and oral hypoglycemic agents alone. The unusual features of this case include a very rapid response to DPI after failure to respond to pure porcine insulin. We believe that DPI is a useful agent in the treatment of insulin resistance.

Acknowledgements: The DPI used in this investigation was supplied by Eli Lilly Company, Indianapolis, Ind., through Dr. John Galloway. Determination of the insulin binding capacity was provided by Dr. Richard Guthrie.

Untoward Effects—Vagotomy or Drainage Procedures?

When medical means have failed to control gastric acid, operations have been employed, all being directed at control of excessive acid. The authors describe the technique and advantage of peritoneal patch pyloroplasty as a surgical procedure proved to be safe and effective in retaining normal gastric emptying time. The authors are from the departments of surgery at Washington University School of Medicine, Barnes Hospital and St. John's Mercy Hospital.

Ulcer and hydrochloric acid have long been linked together, perhaps because both are measurable and are generally related clinically and because reduction of hydrochloric acid causes healing of most ulcers. Almost all regimens for treatment have been directed at control of gastric acid. When medical means have failed, operations have been employed ranging from gastroenterostomy, gastric resection, vagotomy and pyloroplasty to combinations of these, all being directed at control of excessive acid.

"Why is it that as one lives through one successful and superior therapeutic procedure after another, the results approach 85%?"[1] It also is provocative to observe that all procedures have been directed toward the same goal: control of acid. There are increasing suggestions that the basic disturbance in peptic ulcer disease may be an abnormal gastric emptying mechanism (GEM), which itself is not well understood, and that excessive acid is only a manifestation of this defect. While seeking surgical control of acid secretion, however, this important GEM, by intent or accident, has been subjected to adversities which do the following (Fig. 1):

1. Bypass it—as with gastroenterostomy
2. Remove it—as with gastrectomy
3. Distort it—as with Heineke-Mikulicz and Finney pyloroplasties
4. Paralyze it—as with vagotomy.

While the adverse effects of gastroenterostomy, gastric resection and vagotomy are better known, it has only recently been recognized that Finney and Heineke-Mikulicz pyloroplasties themselves may cause delay in gastric emptying, possibly accounting for some of the failures with these methods.[2, 3]

In a study of this problem, our attention was

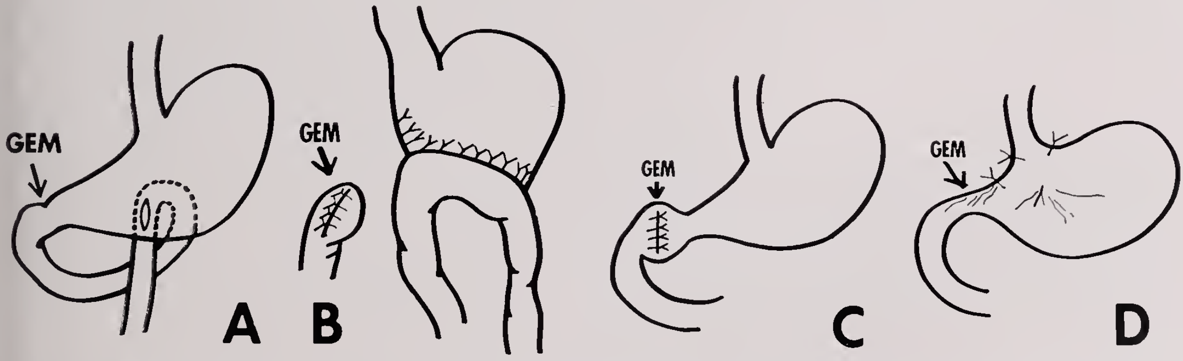

Fig. 1 Method employed to control the acid problem in peptic ulcer disease which have been directed also at the point of gastric emptying mechanism (GEM). (A) Bypass it [gastroenterostomy]. (B) Remove it [gastrectomy]. (C) Distort it [H-M and Finney pyloroplasties]. (D) Paralyse it [vagotomy].

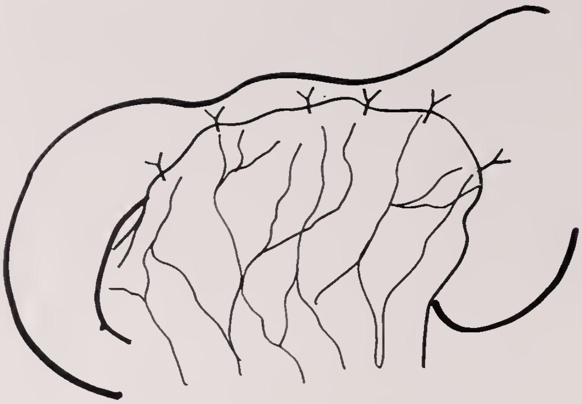

Fig. 2 Finished appearance of the antroduodenotomy with mucosal closure and omental graft as practiced by Qvist. In some instances, this has not prevented cicatricial contracture in our experience.

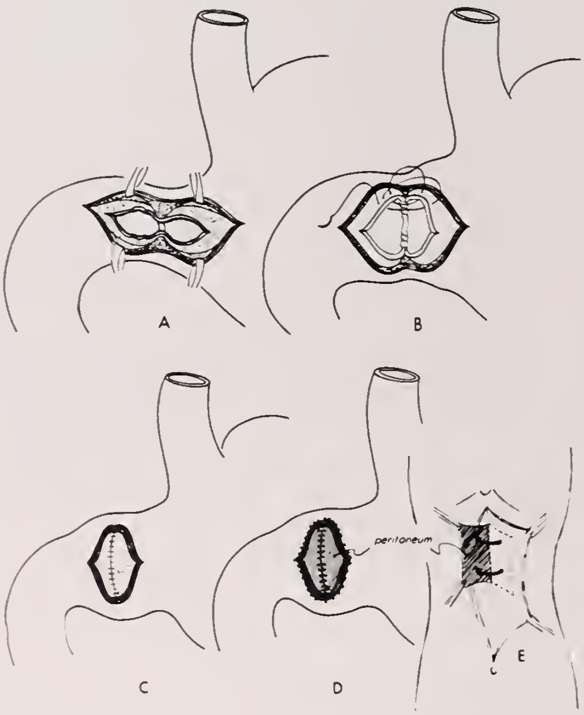

Fig. 3 Technique of peritoneal patch pyloroplasty. A. A longitudinal incision is made in the anteroir pyloric wall through sphincter and mucosa. It is then extended 5 cm into the antrum and 3 cm into the duodenum. Anterior wall ulcers, scars or tumors may be excised. B. The plane between the mucosa and the seromuscular layers is developed so as to mobilize a wide cuff of mucosa which is then closed transversely with a 2-0 chromicized catgut suture. C. The mucosal closure completed. D. & E. A free peritoneal patch dissected away from the parietes is transposed to the seromuscular defect and fixed with either interrupted or continuous marginal sutures of 3-0 dexon.

attracted to the simple observation that the commonly performed pyloromyotomy of Ramstedt, when performed for hypertrophic pyloric stenosis, has resulted in prompt relief of obstruction and absence of long term adverse effects. Certainly, normal gastric emptying seems to occur following sectioning of the pyloric sphincter, and its essential function in the GEM has remained questionable.

A disadvantage of the Ramstedt procedure, when contemplated for treatment of peptic ulcer disease, is that the duodenum is frequently involved with deformities of scar, edema, inflammation or ulcer which eventuate in cicatrix and obstruction.

Qvist[4] has accomplished pyloromyotomy without muscle closure and secured a transverse mucosal closure with an omental graft (Fig. 2). Such grafts have been followed by excessive cicatrix in duodenal closures in some of our cases, thereby creating an obstacle to improving gastric emptying. Thus, the surgical need may be threefold: (1) Allows wide exposure of the antroduodenal region for inspection, biopsy, excision or undersuturing of ulcer when indicated; (2) preserves continuity in the longitudinal neuromuscular gastroduodenal wall; (3) closes the defect safely with protection against subsequent scar contracture. Peritoneal patch pyloroplasty appears to be a method of incorporating the advantages of the Ramstedt pyloromyotomy while avoiding the disadvantages of other types of gastric emptying procedures. This method has been studied in dogs and forms the basis of this report.

Technique of Peritoneal Patch Pyloroplasty (Fig. 3)

A longitudinal incision is made through the pyloric sphincter and extended 5.0 cm through the antrum and 3.0 cm distally through the duodenum. The plane between mucosa and seromuscular layers is developed so as to mobilize a wide cuff of mucosa which is then closed transversely with a continuous 2-0 chromacized catgut suture. A peritoneal patch is dissected sharply and bluntly from the anterior abdominal wall or, even more conveniently, from the fold at the ligamentum teres. This is then applied as an onlay to the seromuscular defect and fixed with a continuous marginal suture of 3-0 dexon.

As Qvist[4] pointed out, by approximating these mucosae over the divided pyloric muscle at the proximal and distal ends of the transverse poles, a lengthened posterior wall is constructed which consists of the entire circumference of the mucosa at the pyloric ring in addition to 1 cm to 2 cm of sutured gastric and duodenal mucosae at both ends.

Experiment

1. Six healthy, adult dogs were subjected to pyloroplasty with transverse mucosal closure only.
2. Six healthy adult dogs were subjected to pyloroplasty with transverse mucosal closure reinforced with a free peritoneal patch taken from the anterior abdominal wall.
3. Control gastric-emptying time for a regular kennel feeding containing Hypaque powder was determined in three healthy adult dogs by serial x-ray examinations.
4. Six months following operations, each survivor dog:
    - A. Had gastric emptying time tests with serial x-ray examinations following a kennel meal containing Hypaque powder.
    - B. Was explored surgically for gross and microscopic biopsy examination of the pyloroplasty.

Results (Fig. 4)

1. *Controls*

Normal gastric emptying time for a kennel meal containing Hypaque powder was found to be 11 to 12 hours when studied in three healthy adult dogs by serial x-ray examinations.

2. *Pyloroplasty With Mucosal Closure Only*

Of the six dogs subjected to mucosal closure only (without peritoneal patch), one died three days postoperatively of a massive blowout of the pyloroplasty. Two others were found to have extensive adhesions between the pylorus, liver and omentum when reexplored six months later. These extensive fibrous adhesions, however, did not interfere with gastric emptying (11 to 12 hours) or with nutrition.

3. *Pyloroplasty, Mucosal Closure and Free Peritoneal Patch*

Of the six dogs with pyloroplasty, mucosal closure and free peritoneal patch, one died ten days postoperatively of evisceration unassociated with any disturbance in the pyloroplasty. Of the five long-term survivors, there was no disturbance in nutrition, and gastric emptying by serial x-ray examination was 11 to 12 hours as with the controls. At reexploration in six months, there was found to be preservation of the originally designed lumen and of the peritoneal patch by measurements. There was no circular muscle regeneration grossly or microscopically. There was no cicatrix, stenosis or extensive adhesion as found in the "nonpatch" dogs.

	MUCOSAL CLOSURE	MUCOSAL CLOSURE PLUS PERITONEAL PATCH
GASTRIC EMPTYING TIME	Normal	Normal
POST-OPERATIVE BLOW-OUT	One	None
ADHESIONS 6 MONTHS POST-OPERATIVE	Two	None
LONG TERM NUTRITION IN SURVIVORS	Excellent	Excellent
PRESERVATION OF DESIGNED LUMEN AT 6 MONTHS	All	All

Fig. 4 Results in dogs subjected to pyloroplasty with mucosal closure only and in those subjected to mucosal closure plus peritoneal patch.

Conclusions

A free peritoneal patch pyloroplasty adds the desired security of a free patch over the mucosal closure while avoiding anatomical and functional interference with the gastroduodenal stream. This type of pyloroplasty is an advantage where pyloric disease requires excision of ulcer, tumor or scar. Reestablishment of gastric drainage with least derangement of anatomy and function is accomplished and the danger of stenosis from a sliding omental graft is avoided. Results in dogs have proved this surgical procedure to be safe and effective in retaining normal gastric emptying time. It is presently being used in humans instead of other types of gastric drainage procedures. A long term follow-up of these patients is being planned.

Selective Tympanocentesis in Children

A Study

Otitis media is a common disease in the pediatric age group, and making an accurate clinical diagnosis often presents a problem. The disease probably is overdiagnosed and, as a result, overtreated since most children given this diagnosis are placed on antibiotic therapy. Many investigators[1-6] have studied acute exudative otitis media by needle aspiration in order to make a bacteriologic diagnosis. In most series, there is a high percentage of sterile aspirates.[7] This study was done to determine the incidence of bacterial isolation in acute otitis media when rigid criteria are observed. The report also is concerned with the degree of correlation between the bacterial isolate from the middle ear fluid, the flora of the nasopharynx and throat and the degree of correlation between the organism cultured and the Gram stain of the same exudate.

Materials and Methods

One hundred randomly selected children (69 male and 31 female) were evaluated. The age range was from two months to 13 years. A smaller number of older children in the series can be accounted for by the smaller incidence of the disease and the difficulty in obtaining good cooperation during the aspiration procedure. All cases had definite bulging of the tympanic membrane, associated with erythema of at least two thirds of the drum or bullous myringitis.

Nearly all had fever, either at the time of tympanocentesis or by history, in the previous 24 hours. Ear canals were prepared prior to aspiration by flushing or swabbing with a benzalkonium preparation. Local analgesia was not routinely used. Under direct vision, the tympanic membrane was entered in the lower posterior quadrant. Exudate obtained by needle aspiration was inoculated on blood and chocolate agar and a Gram stain was made of a drop of the same material. The smears were interpreted by the house officer performing the procedure. Nasopharyngeal and throat swabs were cultured in the same manner at the time of tympanocentesis. The 100 cases includes seven children with bullous myringitis. Thirteen of the 100 patients had antibiotic treatment from one to 14 days prior to aspiration without clinical improvement.

Results

Of 100 aspirates, 78 patients yielded 81 organisms, including *D. pneumoniae, H. influenzae, hemolytic* or *nonhemolytic staphylococcus, Neisseria sp., Streptococcus pyogenes* or *alpha-hemolytic streptococcus.* Two cases had both *D. pneumoniae* and *H. influenzae* and one case had both *D. pneumoniae* and *Neisseria sp.* These data are shown in Table 1 by age group. The correlation of the ear aspirate with the

Streptococcus pyogenes	1		1			2
Alpha-hemolytic streptococcus		1				1
						81

* Two cases grew D. pneumoniae and Neisseria sp. One case grew H. influenzae and Neisseria sp.

nasopharyngeal and throat cultures was poor. In this series, the organism found in the middle ear also was isolated from the nasopharynx in 48% and the throat in 57% of the cases. This is in close agreement with other studies.[1, 4, 5] Only two aspirates grew *Streptococcus pyogenes.* One of these was from a 15-month-old boy with hemorrhagic bullous myringitis.

Table 2 shows the age distribution of the positive cases and the Gram stain correlation. Of the 64 positive cases in which a Gram stain was done, the organism was identified on the smear in 80%. However, in 18 remaining cases in which culture of the exudate was sterile, an organism was seen or thought to be seen on 11 of the stained smears. The identification of an organism, i.e., its morphology and Gram stain properties, was dependent upon the experience and expertise of the house officer. This improved as the study progressed. Another possibility for the false positives was that the organism was not viable or was not present in sufficient numbers to isolate on routine culture.

All 29 cases of *Hemophilus influenzae* otitis occurred in children under four years of age. This included nine of 13 children who were treated with antibiotics prior to aspiration. The "treated" children had received either parenteral long-acting penicillin, an oral penicillin or erythromycin from one to 14 days earlier but failed to improve. The aspirates from the remaining four "treated" patients were sterile.

Discussion

This study was concerned primarily with isolation of bacteria from bulging tympanic membranes. Viral cultures were not performed. Mortimer and Watterson[5] have shown an incidence of bacteria in middle ear exudates of between 50% and 60%. Coffey's series[3] also is comparable. Our isolation of 81 organisms from 78 patients is relatively high. Those aspirates which contained hemolytic and nonhemolytic staphylococcus were included because they were in pure culture in moderate to heavy growth.

TABLE 2

CORRELATION OF GRAM STAIN WITH ASPIRATE CULTURE

		% Correlation
0-6 mo	13/14	93
7-12 mo	11/17	65
1-2 yr	9/11	82
2-4 yr	10/13	77
>4 yr	8/9	89
Totals	51/64	80

Results of this duo-purpose study indicate that when strict diagnostic criteria are followed, the incidence of bacterial isolation in otitis media in children is high. Tympanocentesis is shown to be a safe procedure which can give important information to the clinician interested in accurate diagnosis. It also can be therapeutic. The authors are from The Children's Mercy Hospital where Dr. Fugazzatto is a Pediatric Resident. Dr. Burry also is Associate Professor of Pediatrics, University of Missouri-Kansas City School of Medicine.

Of the seven cases of bullous myringitis in the series, five had bacterial etiology. This is an interesting finding since this condition is usually considered to be a result of viral infection.[8] Although treatment and complications are not the focus of this report, needle aspiration did seem to give immediate relief of pain in many cases. The Gram stain and culture information was generally followed by specific antimicrobial therapy. Follow-up of a large number of these children showed the tympanic membrane to be healed and dry 24 to 72 hours after aspiration and institution of proper antibiotic therapy.

Summary

When strict diagnostic criteria are followed, the incidence of bacterial isolation in otitis media is high. The most frequent offenders continue to be *D. pneumoniae* and *H. influenzae.* The latter is less likely if the child is four years old or older. Nasopharyngeal and throat cultures are not reliable indicators of the organism in the middle ear exudate. The Gram stained smear of the exudate is much more reliable, especially as experience is gained in interpreting the smear.

Tympanocentesis is a safe procedure which can be therapeutic. It can give important information to the clinician interested in accurate diagnosis. Aspiration may be especially valuable when signs and symptoms of infection continue in spite of apparently adequate antimicrobial treatment.

Uterine Leiomyosarcoma at Ellis Fischel State Cancer Hospital

Case Report

Leiomyosarcoma of the uterus is a relatively rare entity reported only sporadically in the literature. In the past ten years, small series of cases have appeared in the English-speaking literature at the rate of one or two per year. A recent case seen at Ellis Fischel State Cancer Hospital (EFSCH) prompted this review of the English literature and, also, a review of the experience at the EFSCH.

Excellent records with virtually 100% follow-up add to the valuable fund of information available at EFSCH. However, only seven cases have been seen and treated in the years from 1940 to 1971, only three of which were primarily diagnosed at EFSCH. The others were referred there for therapy after metastatic disease was established. In that same time period, approximately 40,000 patients were seen at this institution. This surprisingly small incidence of leiomyosarcoma at a specialty cancer hospital reflects the rarity of the lesion. As no one individual or institution has accrued a large series, it is felt that reports of relatively small numbers of cases are valuable in adding to the total fund of knowledge of the lesion covered by the literature.

Case Report

A 51-year-old white woman was first seen at the EFSCH on June 25, 1971 with a history of having completed her menopause approximately 18 months previously and then developing vaginal bleeding which had been continuous for the previous two months. Her local physician detected an exophytic cervical lesion (Pap smear was class II). The patient was gravida VI, para IV, aborta II. Past history revealed a right oophorectomy and appendectomy in 1959. Physical examination was unremarkable except for the findings on pelvic examination. A large necrotic mass was present in the apex of the vaginal vault. Biopsy revealed inflammatory tissue. Her entire diagnostic work-up was otherwise unremarkable, including sigmoidoscopy, cystoscopy, chest x-ray, intravenous pyelogram, barium enema, upper gastrointestinal series, gallbladder series and electrocardiogram.

A second biopsy was obtained and again showed acute inflammation with some areas of necrosis and granulating tissue and, also, dilated vessels with prominent endothelial linings and atypical proliferation of fibroblasts. However, no tumor was recognized. On July 1, the patient was taken to the operating room, and this mass was grasped with a tenaculum and gently retracted toward the introitus. It came out yielding very little resistance. The mass appeared to be a polyp approximately 5 cm x 5 cm and 6 cm in diameter with a small stalk. It was fairly obvious that this was an endocervical polyp arising either in the cervix or in the endocervical and presenting in the endometrial canal. The distal half was necrotic because the blood supply was compromised by the resistance to stretching of the cervix. The inner or more proximal half near the stalk appeared grossly similar to a benign leiomyoma. Other than being greatly dilated, the cervix was unremarkable. Endometrial curettings and four quadrant cervical biopsies were obtained.

Pathology reported the polypoid lesion to be a grade II leiomyosarcoma, believed to be inadequately excised. The remainder of the tissue was within normal limits. On July 13, she underwent a total abdominal hysterectomy and left salpingo-oophorectomy (completion oophorectomy). The postoperative course was benign. The pathology report disclosed that there was no further identifiable leiomyosarcoma in the uterus. There was a tiny area of scarring just inside the endocervix in the endometrial cavity which probably was the area of attachment of the pedunculated polyp.

Discussion

This was an unusual case because uterine leiomyosarcoma rarely presents as a polypoid mass protruding from the cervix. Furthermore, this case prompted a review of the literature and a comparison of the EFSCH series with the literary experience. Ober[1] states that leiomyosarcoma is the most common uterine sarcoma, accounting for approximately 50% to 75% of the sarcomas of the uterus in most series. This was not the case at EFSCH because during the same time period in which seven leiomyosarcomas were seen, there were more than 30 other uterine sarcomas, e.g., mixed mesodermal sarcomas, carcinosarcomas and others.

The average age of our seven patients at the time of their initial diagnosis was 64.5 years. Most reports show lower ages. All the patients seen at EFSCH were postmenopausal. This also is at variance with the usual findings. Most series contain roughly equal numbers of premenopausal and postmenopausal patients. In general, premenopausal patients have been shown to do better.

One additional case was encountered but not included since the patient was not treated at EFSCH for the lesion. She had been treated in 1954 for "precancerous hyperplasia of the endometrium" by intracavitary radium instillation. Her case was closed in 1957. It was fortuitously learned that the patient had a laparotomy and hysterectomy in 1966 for what proved to be leiomyosarcoma of the uterus. No further follow-up was available. The case was of interest in that many authors point to a striking incidence of leiomyosarcoma of the uterus in patients who have had previous radiotherapy to the pelvis, usually for benign uterine conditions. This is the only patient we encountered (although not in our series) who fits this category. She is mentioned simply for that reason.

The question of parity is frequently discussed, though it seems to have no relationship with the onset of this disease. Our series bears this out. Patients were equally divided between nulliparous and multiparous women. The question of race also seems to have little bearing. Of our seven patients, six were white and one was a Negro. The hospital's average Negro population runs about 2%. With such small figures, however, nothing significant can be made of this.

In general, our cases did poorly; only two of the seven are potentially curable. The other five have died of their disease. However, four of these patients were referred for evaluation and treatment of their metastatic lesions and, therefore, represent a worse group of patients in terms of ultimate survival, having already established metastatic disease. Prediagnostic symptoms varied in duration from one to about seven or eight months, usually consisting of some combination of vaginal bleeding or discharge, low back pain or the appearance of a mass or lower abdominal swelling. Metastatic lesions, of course, gave symptoms of varying duration and types depending upon their location. Fairbanks[2] points out that fever may be a very early presenting symptom. The author elsewhere personally observed a case in which this was true. It is of note that in our series, no patient seemed to manifest fever either before the diagnosis of leiomyosarcoma or with the metastatic lesions of leiomyosarcoma.

Bell and Edgehill[3] emphasize the relatively high incidence of double or multiple malignancy. Only one of our seven patients gave a history of previous carcinoma, and that was a cancer of the left breast for which mastectomy was performed some 30 years previously. No coincident gynecologic cancers were found.

Four patients were treated for metastatic disease, and three were treated primarily. One patient had a preoperative diagnosis of ovarian cancer and did not undergo dilation and curettage (D & C). At laparotomy, a huge uterus with apparent attachment to other intra-abdominal and pelvic structures was noted. Because the patient was 78 years of age and, more particularly, because her response to the laparotomy was very poor, it was elected not to further treat this patient but simply to biopsy the mass to verify the diagnosis. She died at home five months later of either uremia or small bowel obstruction. In this patient, the preoperative diagnosis was not properly entertained.

Hindle[4] points out that the preoperative diagnosis is correctly established in only 40% of the cases. Our other two cases which were treated primarily did have the diagnoses established prior to their definitive treatment. Newton[5] points out that in his experience, if the preoperative diagnosis is established properly, i.e., by D & C or cervical biopsy or endometrial curettage, the

---

A recent, unusual presentation of uterine leiomyosarcoma in a patient at Ellis Fischel State Cancer Hospital prompted the author to review that institution's experience with this lesion and compare it to the literature. The surprisingly small incidence of leiomyosarcoma at this specialty cancer hospital reflects the rarity of the lesion. Dr. Shaw is from the Department of Surgery, Washington University School of Medicine, St. Louis and Ellis Fischel State Cancer Hospital.

---

mortality rate is at least 67%. Our two patients, who had their diagnoses established preoperatively, probably represent a more favorable outlook. Our second patient was 54 years old at the time of her treatment. She underwent two diagnostic D & C's, on the second of which the diagnosis of sarcoma of the uterus was made (this constitutes a relatively correct preoperative diagnosis). She underwent total abdominal hysterectomy, as did the patient described here. She also had bilateral salpingo-oophorectomy. Her survival is 16 years to the present time.

The only definitive treatment mentioned in the literature is total abdominal hysterectomy and bilateral salpingo-oophorectomy. No arguments are advanced for doing myomectomies alone, even in patients who seem to have leiomyosarcomas arising in previously existing leiomyomata.

It is stated that in premenopausal women, normal appearing ovaries can be left in place without any sacrifice in terms of mortality. Inasmuch as there seem to be no metastases to the ovaries, this would seem warranted. The other four cases seen at this institution after primary treatment elsewhere all had total abdominal hysterectomy as their primary treatment, the status of the ovaries being unknown in all cases.

The criteria necessary to establish the diagnosis of leiomyosarcoma are debated in the literative. Bartsich,[6] for example, tries to rule out the so-called "cellular leiomyomas" which he feels are clinically benign fibroids with just slightly different microscopic appearances. In his series, this leaves only the invasive forms of leiomyosarcoma in which he would make that definitive diagnosis. In his experience, these are 100% lethal. This is not surprising in that Montague[7] points out, for example, that extension beyond the uterus has proven to be universally fatal. In the three cases treated primarily at the EFSCH, this seemed to be true. The lady who had no definitive treatment but had simply biopsy at the time of her laparotomy apparently had considerable extension beyond the uterus to adjacent pelvis viscera and loops of bowel. She had a relatively rapid termination. The other two patients apparently had leiomyosarcomata arising in previous leiomyomas, which were submucosal in origin. The tumors did not appear to extend into the endometrium in either case and, therefore, not beyond the leiomyoma. Consequently, it was not invasive in either case (our index patient had no other coincidental leiomyomata, whereas the other patient had one coincidental subserous leiomyoma). Neither patient, therefore, would fulfill Bartsich's criteria for the diagnosis of leiomyosarcoma. But this is only one point of view.

The more common viewpoint is that the diagnosis of leiomyosarcoma should be based on histologic grounds alone and not on macroscopic invasion of other organs or the depths of the myometrium. Radman[8] stresses the particularly bad nature of the lesion if it is a so-called "primary lesion" vs the relatively good prognosis if the lesion is a "secondary lesion," that is, arising in a myoma. This is borne out by our two surviving patients, one being a 16-year cure and the other, hopefully, having a good prognosis.

Sprio[9] points out the inadequacies of the conventional histologic criteria as a guide for the behavior of some of the well differentiated, smooth muscle tumors. Several other authors disagree. Gudgeon[10] asserts that "symplastic cells" often referred to in the literature (which are multi-nucleated giant cells) are probably indicative of the benignity of a lesion rather than its malignancy. Criteria favoring the malignant end of the spectrum, as pointed out by Laberge,[11] are anaplasia and high mitotic counts. Both carry a poor prognosis. Laberge, at the opposite end of the spectrum, claims that histologic criteria alone are helpful in indicating the prognosis of the patient. This also was found to be true by Spiro and Koss,[12] who, in their series from Memorial Hospital, reported close to 100% cure rates with what they called stage I lesions, whereas stage II lesions had an approximate 20% cure rate. At stages III and IV, there were virtually no survivors. The stages were based simply on histologic criteria. Once again, they pointed out that leiomyosarcomas arising in previous leiomyomas (which they do consider true leiomyosarcomas if they have the proper histologic appearance) have a much better prognosis.

Boutselis and Ullery[13] report that distant metastases lead the causes of death from uterine leiomyosarcoma particularly lung metastases. In our series, distant spread was apparently not responsible for the death of one elderly lady who had laparotomy for biopsy only. She apparently died for reasons of local extension, which were either bowel or ureter obstruction. One other patient among our five, who were definite nonsurvivors, was referred for treatment of metastatic lesions consisting of peritoneal metastases. These metastases produced multiple partial intestinal obstructions which ultimately became high grade. The patient died of intestinal obstruction nine months following her initial treatment, which had consisted of hysterectomy and coincidental segmental small bowel resection and sigmoid resection. This patient obviously represented far advanced disease at the time of her initial treatment with extension beyond her uterus at that time. It is no wonder that she developed further signs of peritoneal metastases and ultimately succumbed to the same.

So, two of our five deaths were due to nondistant metastatic disease. The other three clearly died of distant metastases. All three had lung metastases plus other areas of metastatic disease. One patient bears some special note. She is a patient previously mentioned who had a mastectomy for breast cancer 30 years prior to the diagnosis of uterine leiomyosarcoma. She was referred because of chest lesions seen by x-ray. Because it could not be established without thoracotomy whether the chest lesions were metastatic breast or metastatic uterine cancer, the patient underwent exploratory thoracotomy and the lesions turned out to be leiomyosarcoma. Since they were easily resectable, however, she underwent a lobectomy for one and a wedge resection for the other. This patient died six or seven months after the thoracotomy, but she represented a 55-month survival after the initial hysterectomy. She probably fits in toward the benign end of the spectrum having gone so long after the initial treatment until the appearance of her metastatic disease. Before her termination, she also developed a bony chest wall metastases, but ultimately died of pneumonia and respiratory failure based on lung parenchymal metastases. The other two patients who had lung metastases were less fortunate and died seven to ten months, respectively, after their hysterectomies. Both died of respiratory failure. In addition to lung metastases, one also had recurrence at the vaginal cuff.

SUMMARY

A recent, unusual presentation of uterine leiomyosarcoma seen in a patient at Ellis Fischel State Cancer Hospital prompted a review of this institution's experience with this lesion and a comparison with the literature. The overall survival rate of this small series of seven patients is at best 2:7. However, four were referred for treatment of already established metastatic disease.

It is agreed that primary treatment should consist of total abdominal hysterectomy. The criteria for establishing the diagnosis are discussed at length in relation to comments of other authors. Lesions without invasion of the uterine stroma or adjacent structures (as in the index case) carry the best prognosis. Histologic criteria are likewise important prognostic signs. Causes of death of the five nonsurvivors are discussed. One additional case not in the series is mentioned only for its relationship to previous pelvic irradiation.

Missouri State Medical Association presents for its members and their families

Rhine Escape

11 Days in the Heart of Europe Featuring a Luxurious 5 Day Cruise Through Holland, Germany, France and Switzerland.

$569 inclusive

The Great Escape! Imagine an exciting four-country cruise through Holland, Germany, France and Switzerland along the Mighty Rhine. It's individualized service all the way from your chartered jet to your deluxe hotel accommodations in Amsterdam and Zurich for a fun-filled holiday of shopping, sightseeing and nightlife.

Your Rhine cruise ship takes you through the most beautiful and romantic parts of Europe. See fairytale castles! Explore medieval towns that haven't changed in thousands of years! Sample the great Rhine wines from lush mountain vineyards!

You'll travel in a spacious deluxe outside cabin with private bath; enjoy cuisine from all of Europe as well as American specialties. The continental service meets the most demanding standards. There will be fresh flowers in your cabin every day and a hospitality desk throughout your stay for individual and group sightseeing arrangements.

It's an unforgettable experience!

President's Message

WHAT'S NEXT FOR MEDICINE?

During the past few months, two national laws involving the practice of medicine have been passed—PSRO and HMOs. The next major move on Capitol Hill will be some form of national health insurance. American medicine is at the threshold of long-range shifts in financing and delivery of health care services. This has been made obvious by the many legislative proposals. They vary from the compulsory health services modeled after the British or Swedish plans to one that we now have in Medicare and Medicaid. Hopefully, the changes will be financial in nature and with a minimal amount of controls over the providers.

There may be attempts to develop a "production line" type of efficiency for the delivery of medical care. But a health services system can *never* approximate the industrial model as long as patient needs and demands are as varied as they are and the physician is given the professional freedom to diagnose and treat patients as he deems necessary. Dr. C. A. Hoffman, our AMA President, also points out that good medical care and good health are not the same thing. The first may be considered a person's right, but good health is one's own responsibility and cannot be legislated.

However, Congress will try to do so. So, we must hope for a national health policy like Medicredit, which has been created by the AMA and already has 167 sponsors among the legislators. It would take care of the poor and the aged and has the important catastrophic clause which would cover long-term illness and severe accidents. Even the families who want to—and usually can—provide for themselves cannot cope with the expense of prolonged illness. They greatly fear this possibility.

E. A. Stricker, M.D.

Medicredit is voluntary and protects the physician-patient relationship even while making insurance coverage available to everyone. It would work on a sliding-scale system of income tax credit, allowing persons to buy health protection from private insurers. Also, it could be handled through existing channels without creating another massive and costly federal bureaucracy.

Medicredit is a plus for doctors and for the AMA because it is a positive and helpful approach to the health care problem. It is giving us a much better image with the lawmakers, even though the picture is not yet fully developed.

Woman's Auxiliary

50th Anniversary

Spring has meant "Rally Days" to members of the MSMA Woman's Auxiliary this year, and rally they did to our district meetings in St. Charles, St. Louis, Joplin, Springfield, Kansas City, Cape Girardeau, Columbia and Sedalia. We are grateful for their cooperation.

Mrs. Charles R. Willman
President

Success of the meetings can be attributed to Mrs. William McPhee of Jackson County, our President-Elect; Mrs. Truman Schertz of Clay County; and Mrs. John Balhuizen of Clay County. As members of our state Program Development Committee, they worked with the State Auxiliary's ten district directors and all county auxiliary presidents.

The Woman's Auxiliary has initiated an inspiring *Five Point Tel-Star Program* which we believe will increase auxiliary service opportunities throughout the state and attract the membership of many doctors' wives who have yet to join the Auxiliary. The program was explained at each district meeting by members of a special traveling team, as follows:

★ **TEL-E-MEMBER**—Mrs. George Lytton of Kansas City, President-Elect, explained this point which is concerned with increasing our membership and, in turn, increasing the effectiveness of our efforts on behalf of good legislation. If your wife is not an auxiliary member or member-at-large, please ask her to contact Mrs. Donald Fakhoury, 4332 N. Central, Kansas City 64116.

★ **TEL-E-PROGRAM**—Mrs. McPhee discussed this point of the star which offers 13 excellent package programs developed to focus public attention on current health needs and to help county auxiliaries plan and implement these programs. Subject matter includes Nutrition, Alcohol, Physical Fitness, Drug Abuse, Immunization, Smoking, Sex Education, Teenage Venereal Disease, Blood Donors and Mental Health of Children.

★ **TEL-E-COMMUNITY**—This plan suggests Auxiliary-sponsored Health Education Conferences in our communities as a means of raising the level of awareness of the vital need for all citizens to develop a sense of personal and community responsibility for solving health problems.

★ **TEL-E-YOUTH**—Health Manpower, the AMA-Educational Research Fund and the Missouri State Medical Foundation (student loan fund) are included in this program, which was explained by Mrs. Larry Ozenberger of Plattsburg, AMA-ERF Chairman of the MSMA Auxiliary. The goals are to continue to interest young people in health careers and further support the two loan funds. The AMA-ERF provides funds for students and medical schools throughout the nation. The MSMF provides financial assistance for medical students in Missouri. We urge you to send your contributions today for the MSMF to Mrs. James Gordon, 600 Boonville Rd., Jefferson City 65101.

★ **TEL-E-LEG**—This new program also is known as LEGS or Legislative Effort Group System, which is a unique communications system that Auxiliary members will use to assist the MSMA by conveying on a moment's notice the views of Missouri physicians to county, state or national legislators and others who are concerned. Mrs. Gerald L. Miller of Kansas City is the State Auxiliary Legislation Chairman and the team member involved with this point.

We hope that the Auxiliary *Tel-Star* program will capture the interest of the MSMA members, also . . . and that you'll watch this page in future issues for news of further developments.

EDITORIAL

ALL FOR $1.50

I suppose this is not the spot for a book review, but perhaps it is—at least for this one. As an introduction, may I quote a personal experience.

My grandfather died when I was in high school. He and I were very close, as it has usually been when age and experience still had some value. Even as a boy, I respected him because I knew he worked hard, was successful, realistic and practical. Therefore, even though I knew little of such things, it came as a shock to me when my grandfather departed this life without a will. He was well along in his 70s and he certainly had ample warning to prepare for death.

Fortunately, the family behaved as my grandfather would have expected. The necessary signatures were obtained and my grandmother was provided for as everyone knew was intended, but all this took time, effort and probate expense. Much of that could so easily have been avoided. Although I found all this difficult to believe in my grandfather's case, I am much more puzzled now to find that some of my contemporaries and colleagues behave similarly. Perhaps dying without a will is not so frequent now as a generation ago, but I am told by an attorney-friend that the equally fundamental and critical matter of planning for the disposition of one's estate is, more often than not, never properly executed.

In these days of increasingly restrictive laws and confiscatory taxes, it is not easy to accumulate an estate. Therefore, how much more foolish it becomes not to utilize every legal means to see that what is accumulated is disposed of as desired by the person who worked to acquire it. That great jurist, Learned Hand, wrote ". . . there is not even a patriotic duty to increase one's taxes." But that is precisely what occurs when estate planning is not done. The great recipient is Uncle Sam.

This is a long-winded way of recommending a book. Every person who reads this editorial and who has not studiously considered the disposition of his worldly goods should purchase this book and should be quick about it. This book is "The Complete Estate Planning Guide," by Robert Brosterman (paper bound, Mentor Executive Library, MW-1015, $1.50). This book is updated to include present laws, has gone through many printings and is widely used popularly and in college and graduate courses. It is easy to read, full of sensible advice and startling warnings. It will certainly convince the reader of the advisability of putting his affairs in order and periodically doing it all over again as his estate diminishes or increases. This book, by no means, will replace good legal counsel, but it will make the estate owner a vastly better informed individual when he goes to his attorney.

Proper planning for the disposal of one's estate, large or small, may not insure peace for a man's soul, but it should do much for his peace of mind.

WILFRED E. WOOLDRIDGE, M.D.
Springfield

IMPROVED ACCIDENT & HEALTH PROGRAMS

The Disability Income Policy sponsored by the Missouri State Medical Association since 1943 has now been made GUARANTEED RENEWABLE and income benefits are available up to $300.00 weekly to members under age 56 subject to acceptance by the Company.

Also, the Major Hospital and Nurse Expense Program offers higher limits with increased Room & Board Benefits.

County Society News

FIRST DISTRICT

COUNCILOR
JOHN N. MARTIN, M.D., ST. JOSEPH

BUCHANAN COUNTY MEDICAL SOCIETY

The annual "Cancer" meeting of the Buchanan County Medical Society was held on April 4 following a dinner at the Hotel Robidoux in St. Joseph.

The program was sponsored by the Buchanan County Unit of the American Cancer Society. The speaker was Virgil Loeb, Jr., M.D. of St. Louis, who presented a paper on "Medical Oncology—An Emerging Specialty."

An instructor and researchers in the field of cancer, Dr. Loeb told of advances in chemotherapy treatment of cancer, particularly leukemia. He also cited the possibilities in cancer treatment by immunology.

Dr. Loeb was introduced by Mr. Richard J. Knox, executive director of the Buchanan County and Northwest Missouri units of the Cancer Society. Mr. Knox was honored at the meeting with a resolution of appreciation for his effective work in combatting cancer and for his civic contributions to the community.

The program and meeting were arranged by members of the Society's program committee, who are Dr. Gerald E. Fox, chairman; Dr. Edward M. Beheler; and Dr. Sydney L. Bryant.

MISSOURI MEDICINE

We hope that you have made this address change in your records and mail list. Our phone number remains the same . . . 314-636-5151.

New MSMA HEADQUARTERS

Our new headquarters is an historic site located across from the Governor's Mansion and two blocks from the State Capitol. The City Parking Garage is only one-half block away.

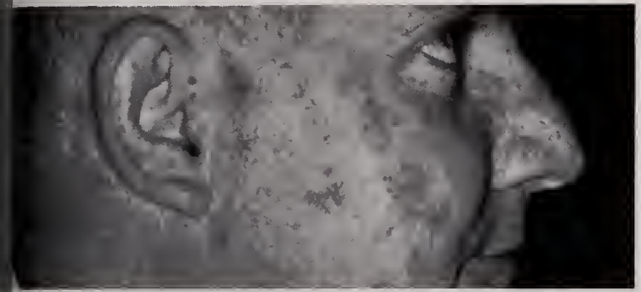
What's on your patient's face...

may be more important than
his chief complaint

he lesions on his face may
e solar/actinic — so-called
enile" keratoses...and
ney may be premalignant.

olar, actinic or senile keratoses

hese lesions may be called by several names, but they
sually can be identified by the following character-
tics: the typical lesion is flat or slightly elevated, of a
ownish or reddish color, papular, dry, rough, adherent,
nd sharply defined. They commonly occur as multiple
sions, chiefly on the exposed portions of the skin.



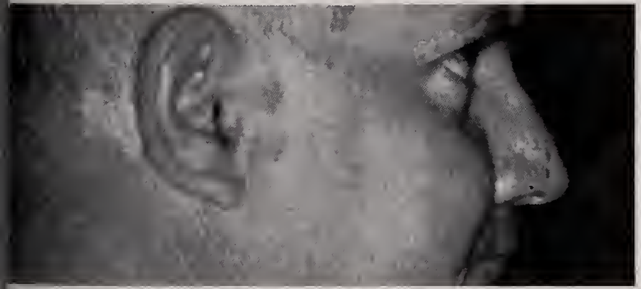
atient P.T. seen on 3/29/67 shows typical lesions of*
oderately severe keratoses. Note residual scarring on
dge of nose from previous cryosurgical and electro-
urgical procedures.

equence of therapy/
electivity of response

fter several days of therapy with Efudex® (fluorouracil),
ythema may begin to appear in the area of the lesions;
e reaction usually reaches its height of unsightliness
nd discomfort within two weeks, declining after dis-
ontinuation of therapy. This reaction occurs in affected
reas. Since the response is so predictable, lesions that
o not respond should be biopsied.

cceptable results

reatment with Efudex provides highly favorable cos-
etic results. Incidence of scarring is low. This is
articularly important with multiple facial lesions.
fudex should be applied with care near the eyes, nose
nd mouth.



atient P.T. seen on 6/12/67, seven weeks after discon-*
inuation of 5%-FU cream. Reaction has subsided.
esidual scarring not seen except for that due to prior
urgery. Inflammation has cleared and face is clear of
eratotic lesions.

ata on file, Hoffmann-La Roche Inc., Nutley, N.J.

Before prescribing, please consult complete product information, a summary of which follows:

Indications: Multiple actinic or solar keratoses.
Contraindications: Patients with known hypersensitivity to any of its components.
Warnings: If occlusive dressing used, may increase inflammatory reactions in adjacent normal skin. Avoid prolonged exposure to ultraviolet rays. Safe use in pregnancy not established.
Precautions: If applied with fingers, wash hands immediately. Apply with care near eyes, nose and mouth. Lesions failing to respond or recurring should be biopsied.
Adverse Reactions: Local—pain, pruritus, hyperpigmentation and burning at application site most frequent; also dermatitis, scarring, soreness and tenderness. Also reported—insomnia, stomatitis, suppuration, scaling, swelling, irritability, medicinal taste, photosensitivity, lacrimation, leukocytosis, thrombocytopenia, toxic granulation and eosinophilia.
Dosage and Administration: Apply sufficient quantity to cover lesion twice daily with nonmetal applicator or suitable glove. Usual duration of therapy is 2 to 4 weeks.
How Supplied: Solution, 10-ml drop dispensers —containing 2% or 5% fluorouracil on a weight/weight basis, compounded with propylene glycol, tris(hydroxymethyl)aminomethane, hydroxypropyl cellulose, parabens (methyl and propyl) and disodium edetate.
Cream, 25-Gm tubes—containing 5% fluorouracil in a vanishing cream base consisting of white petrolatum, stearyl alcohol, propylene glycol, polysorbate 60 and parabens (methyl and propyl).

This patient's lesions were resolved with

Efudex®

Nutley, N.J. 07110

Antivert®
(meclizine HCl)
for vertigo*

...and then on to Venice

ndicated in the management of nausea,
miting and dizziness associated with mo-
n sickness.

'ound useful in the management of verti-
associated with diseases affecting the ves-
ular system.

Available as Antivert® (12.5 mg. meclizine
Cl) blue and white scored tablets and also
Antivert®/25 (25 mg. meclizine HCl) yel-
v and white scored tablets.

INDICATIONS. Based on a review of this drug by
the National Academy of Sciences-National Research
Council and/or other information, FDA has classified
the indications as follows:

Effective: Management of nausea and vomiting and
dizziness associated with motion sickness.

Possibly Effective: Management of vertigo asso-
ciated with diseases affecting the vestibular system.

Final classification of the less than effective indica-
tions requires further investigation.

CONTRAINDICATIONS. Administration of Antivert during pregnancy or to women who may become pregnant is contraindicated in view of the teratogenic effect of the drug in rats.

The administration of meclizine to pregnant rats during the 12th-15th day of gestation has produced cleft palate in the offspring. Limited studies using doses of over 100 mg./kg./day in rabbits and 10 mg./kg./day in pigs and monkeys did not show cleft palate. Congeners of meclizine have caused cleft palate in species other than the rat.

Meclizine HCl is contraindicated in individuals who have shown a previous hypersensitivity to it.

WARNINGS. Since drowsiness may, on occasion, occur with use of this drug, patients should be warned of this possibility and cautioned against driving a car or operating dangerous machinery.

Usage in Children: Clinical studies establishing safety and effectiveness in children have not been done; therefore, usage is not recommended in the pediatric age group.

Usage in Pregnancy: See "Contraindications."

ADVERSE REACTIONS. Drowsiness, dry mouth and, on rare occasions, blurred vision have been reported.

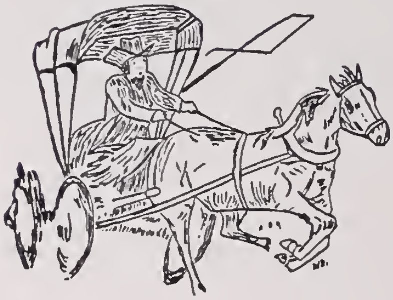
LEO H. POLLOCK, M.D.

Missouri Medicine in Review



FORTY YEARS AGO

Dr. Dudley S. Conley, Columbia, professor of surgery at the University of Missouri School of Medicine, has been appointed dean of the school to succeed Dr. Edgar Allen, who has tendered his resignation to become effective at the beginning of the next school year. Dr. Conley became a member of the faculty of the M.U. School of Medicine in 1919. He formerly was a member of the faculty of Columbia University College of Physicians and Surgeons, where he received his medical degree in 1906. Dr. Allen has resigned to join the faculty of the Yale University School of Medicine.

Dr. M. Pinson Neal, Columbia, was the guest of the staff of Freeman Hospital in Joplin on May 11.

The Ear, Nose and Throat Club of St. Louis has elected officers. They are Dr. L. W. Dean, acting president and senior member of the Executive Committee, and Dr. B. J. McMahon, secretary.

The Kansas City Urological Society has elected the following officers for the ensuing year: Drs. Oscar Davidson, Kansas City, Kan., president; Julius Frisher, Kansas City, vice-president; and Irwin S. Brown, Kansas City, secretary.

TWENTY-FIVE YEARS AGO

Jesse E. Douglass, M.D., Webb City, was installed as president of the Missouri Trudeau Society at a meeting on March 14. Florence MacInnes, M.D., Kansas City, was elected president-elect.

Editorial Note: "The vote of the British Medical Association reported recently in the press is a vote against bureaucratic regimentation which cannot, by any stretch of the imagination, be correctly called a 'strike vote.' At no time have our British colleagues implied a strike against those who have been and always will remain their only employers, their patients. The physicians of Britain have indicated no tendency to desert their posts of duty. Neither moral law nor the ethics of medicine require the physician to subject himself to conditions under which service to his patients will be made onerous or, because of compulsion, the keen edge of that inward desire to serve made dull. In view of these incontrovertible facts, the overwhelming objection of the doctors of Britain against the stifling hand of authoritarianism is readily understood. A life worth living is worth fighting for. The life of medical practice soon would die beneath the sterile rays of a parliamentary made practice by edict. The American people, the political weather vanes, the journalistic opportunists might well take heed."

TEN YEARS AGO

At an April meeting of the American Dermatological Association, six men were singled out for preeminence in the specialty. Among them was Richard S. Weiss, M.D., St. Louis.

Recently-elected officers of the St. Louis Gynecological Society are Drs. Milton Meyerhardt, president; Thomas M. Mier, vice-president; Carl J. Dreyer, secretary; Arthur Bortnick, treasurer; and M. H. Backer, Jr., editor.

Joseph S. Cope, M.D., Lexington, has been elected president of the Lexington Library Board.

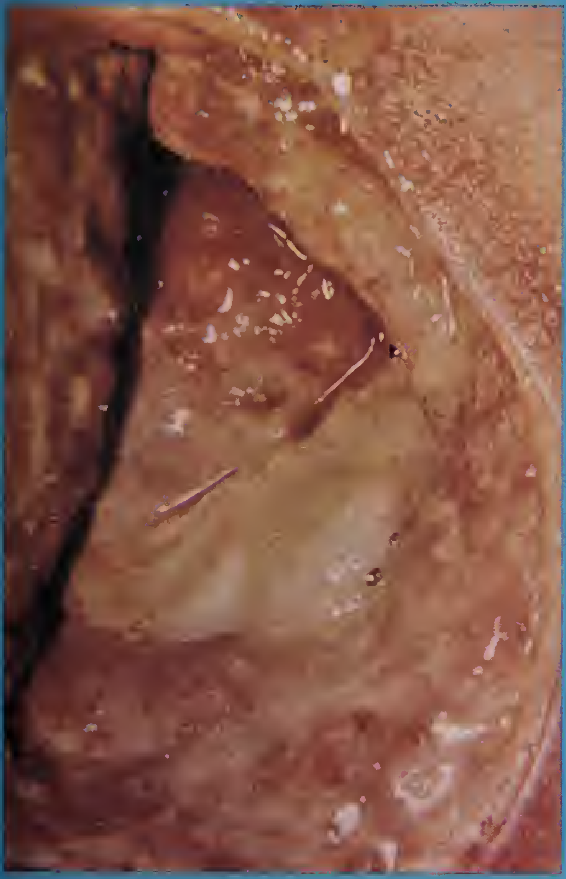
The 11th consecutive annual joint meeting of the Buchanan County Medical Society and the Northwest Missouri District Dental Society was held on May 1 in the Empire Room of Hotel Robidoux. Seventy-eight Northwest Missouri and Northeast Kansas physicians and dentists attended the dinner and program. Presiding jointly at the meeting were the presidents of the two organizations, John R. McDaniel, M.D. and George T. Hopkins, D.D.S.

A dinner meeting of the Ozarks Medical Society and the members' wives was held at Crowe's Dinner House in Cassville on April 9. Local arrangements for the evening were made by Dr. Mary Newman of Cassville.

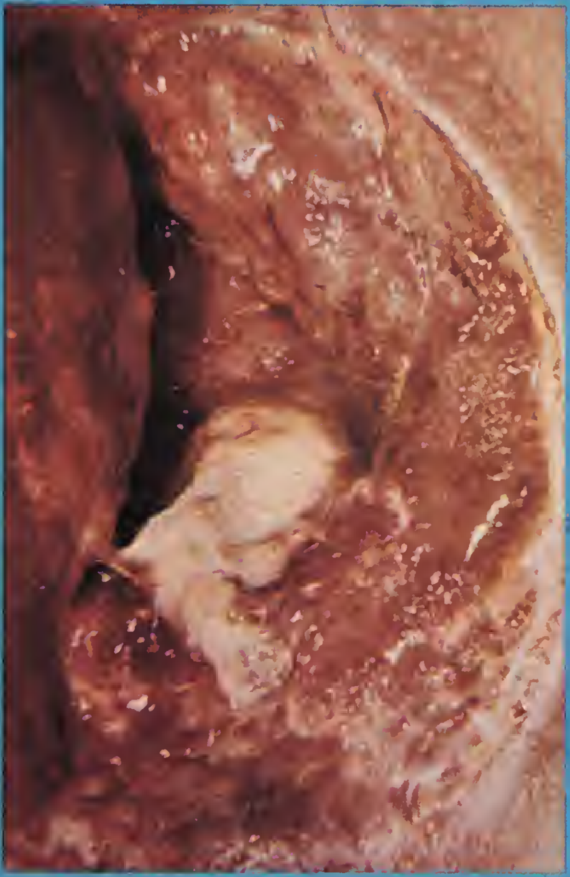
Decubitus Ulcers Yield to

Travase® Ointment

brand of **Sutilains**



Before treatment, necrotic matter coated the inner surfaces of this decubitus ulcer.



After six days of TRAVASE therapy, debridement is nearly complete and granulation evident.

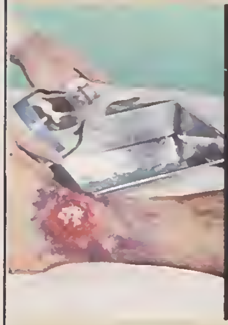
ravase® Ointment brand of Sutilains

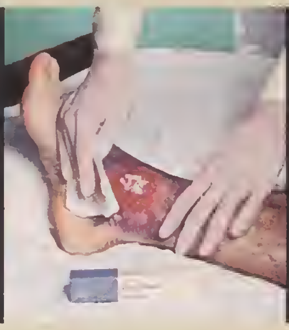
PPLICATION TECHNIQUE: TRAVASE Ointment is indicated as an adjunct o established methods of wound care for biochemical debridement. It lissolves and facilitates the removal of necrotic tissues and purulent xudates.

RAVASE enzymes are selective. Virtually inactive on viable tissue.

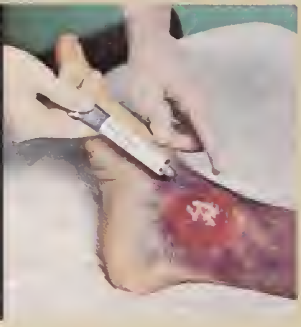
Vhen this recommended nursing technique is followed without deviation, his procedure can generate visible improvement within 48 hours . . .



cer being irrigated) oroughly cleanse and gate the wound area using y sterile water or sodium oride solution. Be sure to anse the wound of any iseptics or heavy-metal ibacterial agents which y interfere with the yme activity.

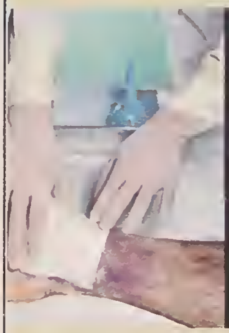


Thoroughly soak the wound area. Where practical, tubbing or showering is suitable. Or wet soaks with gauze pads may be used. Remember to avoid chemical cleansing agents which may interfere with the therapy.

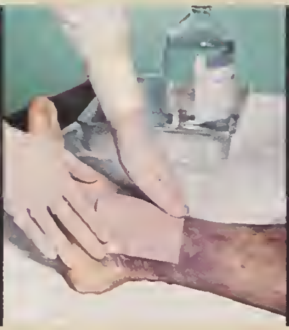


With a sterile cotton swab or finger cot, apply a very **thin** layer of TRAVASE Ointment. The ointment spreads easily and only a small amount is needed (a small dab of ointment will cover an area as big as the back of a hand).

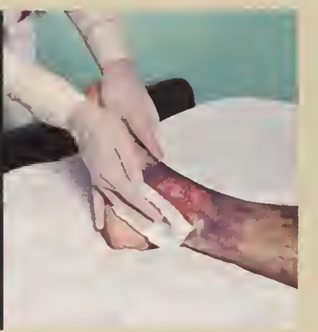
Be sure, though, to rub the ointment well into every crack or crevice of the wound and overlap the surrounding skin one-fourth to one-half inch beyond the area to be debrided—to be sure of complete coverage.



ply loose, wet dressings, oroughly soaked in sodium loride solution or sterile iter to the area to be brided only.



Cover the moist dressings with an occlusive wrap (Saran wrap, Telfa Pads, or other plastic wrappings) to keep wound site moist. Do not extend occlusive wrap over ½ inch beyond area to be debrided.



When changing dressing, gently wipe away the dissolved material. Repeat the complete dressing procedure, including application of TRAVASE Ointment, four times daily.

ie ulcer shown in these photos is simulated on a model in order to demonstrate e correct TRAVASE application technique.

______Additional Information on TRAVASE® Ointment (brand of Sutilains)

______In-service training program

______Comment ______________________________

DESCRIPTION: TRAVASE® (brand of sutilains) Ointment is a preparation of proteolytic enzymes, elaborated by **Bacillus sut** hydrophobic ointment base consisting of 95% white petrolatu polyethylene. One gram of ointment contains approximately 8 units* of proteolytic activity.

ACTION: TRAVASE Ointment selectively digests necrotic soft proteolytic action. It dissolves and facilitates the removal of n tissues and purulent exudates that otherwise impair formation granulation tissue and delay wound healing (4).

At body temperatures these proteolytic enzymes have optimal the pH range from 6.0 to 6.8.

INDICATIONS: For wound debridement (1,2)—TRAVASE Ointn indicated as an adjunct to established methods of wound care biochemical debridement of the following lesions:

Second and third degree burns,
Decubitus ulcers,
Incisional, traumatic, and pyogenic wounds,
Ulcers secondary to peripheral vascular disease.

CONTRAINDICATIONS: Application of TRAVASE (brand of sut Ointment is contraindicated in the following conditions:

Wounds communicating with major body cavities,

Wounds containing exposed major nerves or nervous tiss

Fungating neoplastic ulcers,

Wounds in women of child-bearing potential—because of laboratory evidence of effects of TRAVASE upon the deve

WARNING: Do not permit TRAVASE Ointment to come into cc the eyes. In treatment of burns or lesions about the head or the ointment inadvertently come into contact with the eyes, th be immediately rinsed with copious amounts of water, prefera

PRECAUTIONS: A moist environment is essential to optimal a enzyme. Enzyme activity may also be impaired by certain age several detergents and antiseptics (benzalkonium chloride, hexachlorophene, iodine, and nitrofurazone) may render the s indifferent to the action of the enzyme (3). Compounds such containing metallic ions interfere directly with enzyme activit slight degree, whereas neomycin, sulfamylon-streptomycin, ar do not affect enzyme activity. In cases where adjunctive topic has been used and no dissolution of slough occurs after treat TRAVASE Ointment for 24 to 48 hours, further application, be interference by the adjunctive agents, is unlikely to be rewar

In cases where there is existent or threatening invasive infect appropriate systemic antibiotic therapy should be instituted c

Although there have been no reports of systemic allergic rea humans, studies have shown that there may be an antibody r humans to absorbed enzyme material.

ADVERSE REACTIONS: Adverse reactions consist of mild, tra paresthesias, bleeding and transient dermatitis. Pain usually controlled by administration of mild analgesics. Side effects enough to warrant discontinuation of therapy occasionally ha

If bleeding or dermatitis occurs as a result of the application (brand of sutilains) Ointment, therapy should be discontinued toxicity has been observed as a result of the topical applicati TRAVASE Ointment.

Dosage and Administration

STRICT ADHERENCE TO THE FOLLOWING IS REQUIRED FC RESULTS OF TREATMENT

1. Thoroughly Cleanse and Irrigate Wound Area with so or water solutions. Wound **MUST** be cleansed of anti heavy-metal antibacterials which may denature enzy substrate characteristics (e.g., Hexachlorophene, Sil Benzalkonium Chloride, Nitrofurazone, etc.).
2. Thoroughly moisten wound area either through tubbi or wet soaks (e.g., sodium chloride or water solution
3. Apply TRAVASE Ointment in a thin layer assuring int with necrotic tissue and complete wound coverage e ¼ to ½ inch beyond the area to be debrided.
4. Apply loose wet dressings.
5. Repeat entire procedure 3 to 4 times per day for bes

How Supplied

3P3002 TRAVASE Ointment is supplied sterile in one-half (14.2 g.) containing 82,000 casein units of sutilains hydrophobic ointment base.

The ointment must be stored under refrigeration at 2° to 10° (35° to 50° F).

How strong must a tranquilizer be for severe anxiety?

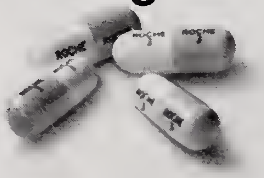
As strong as Librium® 25 mg

(chlordiazepoxide HCl)

ROCHE
ROCHE

The achievement of desired therapeutic results is often a function of the dosage *strength* as well as the drug's intrinsic action. Thus, when anxiety is *severe*, the 25-mg strength of Librium frequently provides the necessary antianxiety action with a minimum of unwanted adverse reactions. Librium 25 mg is a convenient dosage form for the relief of severe, incapacitating anxiety, specifically formulated to supplement your counsel and reassurance.

Benefits-to-risks ratio permits higher dosage



For over 13 years, Librium has been recognized for its excellent benefits-to-risks ratio, an asset in the *higher* dosage ranges as in more common clinical applications. Thus, the frequency of dosage with Librium 25 mg can be flexibly adjusted to the needs and response of the individual patient, up to 100 mg daily if required. Total daily dosage for the elderly and debilitated should not exceed 20 mg. When severe anxiety has been reduced, Librium dosage should be correspondingly reduced or discontinued entirely.

basic support in severe anxiety

Librium® 25 mg

(chlordiazepoxide HCl)

1 capsule t.i.d./q.i.d.

ROCHE

Roche Laboratories
Division of Hoffmann-La Roche Inc

Before prescribing, please
plete product information, a sun
which follows:

Indications: Relief of anxiet
occurring alone or accompanying v
states.

Contraindications: Patients
hypersensitivity to the drug.

Warnings: Caution patients
combined effects with alcohol and
depressants. As with all CNS-actin
patients against hazardous occupat
complete mental alertness (*e.g.*, op
ery, driving). Though physical and
dependence have rarely been repor
mended doses, use caution in admi
addiction-prone individuals or the
increase dosage; withdrawal symp
convulsions), following discontinu
drug and similar to those seen with
have been reported. Use of any drug in pregr
lactation, or in women of childbearing age re
that its potential benefits be weighed against
possible hazards.

Precautions: In the elderly and debilit
and in children over six, limit to smallest eff
tive dosage (initially 10 mg or less per day) t
preclude ataxia or oversedation, increasing g
ally as needed and tolerated. Not recommen
in children under six. Though generally not
ommended, if combination therapy with oth
psychotropics seems indicated, carefully cons
individual pharmacologic effects, particularl
use of potentiating drugs such as MAO inhil
and phenothiazines. Observe usual precautio
presence of impaired renal or hepatic functi
Paradoxical reactions (*e.g.*, excitement, stimu
and acute rage) have been reported in psychi
patients and hyperactive aggressive children
Employ usual precautions in treatment of an
states with evidence of impending depressio
suicidal tendencies may be present and prote
measures necessary. Variable effects on blo
coagulation have been reported very rarely
patients receiving the drug and oral anticoag
lants; causal relationship has not been establ
clinically.

Adverse Reactions: Drowsiness, ataxi
confusion may occur, especially in the elderl
debilitated. These are reversible in most inst
by proper dosage adjustment, but are also oc
sionally observed at the lower dosage ranges
few instances syncope has been reported. Als
countered are isolated instances of skin erup
edema, minor menstrual irregularities, naus
constipation, extrapyramidal symptoms, inc
and decreased libido—all infrequent and ger
controlled with dosage reduction; changes i
patterns (low-voltage fast activity) may ap
during and after treatment; blood dyscrasias
cluding agranulocytosis), jaundice and hepa
dysfunction have been reported occasionally
ing periodic blood counts and liver function
advisable during protracted therapy.

Supplied: Librium® Capsules contain
5 mg, 10 mg or 25 mg chlordiazepoxide H
Libritabs® Tablets containing 5 mg, 10 mg
25 mg chlordiazepoxide.

116th MSMA Annual Session
April 4-7, 1974 Kansas City

Everybody experiences psychic tension.

Most people can handle this tension.

Some people develop excessive psychic tension and need your counse

and a few may need counseling
and the psychotropic action of Valium® (diazepam).

Before deciding to make Valium
zepam) part of your treatment
, check on whether or not the
ent is presently taking drugs
, if so, what his response has
n. Along with the medical and
al history, this information can
you determine initial dosage,
possibility of side effects and
ultimate prospects of success
ilure.

While Valium can be a most
ful adjunct to your counseling,
ould be prescribed only as long
xcessive psychic tension per-
; and should be discontinued
en you decide it has accom-
hed its therapeutic task. In
eral, when dosage guidelines
followed, Valium is well
rated (see Dosage). For con-
ience it is available in 2-mg, 5-mg
10-mg tablets.

Drowsiness, fatigue and ataxia
e been the most commonly re-
ted side effects.

Until response is determined,
ents receiving Valium should
autioned against engaging in
ardous occupations requiring
plete mental alertness, such
riving or operating machinery.

ROCHE
Roche Laboratories
Division of Hoffmann-La Roche Inc.
Nutley, N.J. 07110

Before prescribing, please consult complete product information, a summary of which follows:

Indications: Tension and anxiety states; somatic complaints which are concomitants of emotional factors; psychoneurotic states manifested by tension, anxiety, apprehension, fatigue, depressive symptoms or agitation; symptomatic relief of acute agitation, tremor, delirium tremens and hallucinosis due to acute alcohol withdrawal; adjunctively in skeletal muscle spasm due to reflex spasm to local pathology, spasticity caused by upper motor neuron disorders, athetosis, stiff-man syndrome, convulsive disorders (not for sole therapy).

Contraindicated: Known hypersensitivity to the drug. Children under 6 months of age. Acute narrow angle glaucoma; may be used in patients with open angle glaucoma who are receiving appropriate therapy.

Warnings: Not of value in psychotic patients. Caution against hazardous occupations requiring complete mental alertness. When used adjunctively in convulsive disorders, possibility of increase in frequency and/or severity of grand mal seizures may require increased dosage of standard anticonvulsant medication; abrupt withdrawal may be associated with temporary increase in frequency and/or severity of seizures. Advise against simultaneous ingestion of alcohol and other CNS depressants. Withdrawal symptoms (similar to those with barbiturates and alcohol) have occurred following abrupt discontinuance (convulsions, tremor, abdominal and muscle cramps, vomiting and sweating). Keep addiction-prone individuals under careful surveillance because of their predisposition to habituation and dependence. In pregnancy, lactation or women of childbearing age, weigh potential benefit against possible hazard.

Precautions: If combined with other psychotropics or anticonvulsants, consider carefully pharmacology of agents employed; drugs such as phenothiazines, narcotics, barbiturates, MAO inhibitors and other antidepressants may potentiate its action. Usual precautions indicated in patients severely depressed, or with latent depression, or with suicidal tendencies. Observe usual precautions in impaired renal or hepatic function. Limit dosage to smallest effective amount in elderly and debilitated to preclude ataxia or oversedation.

Side Effects: Drowsiness, confusion, diplopia, hypotension, changes in libido, nausea, fatigue, depression, dysarthria, jaundice, skin rash, ataxia, constipation, headache, incontinence, changes in salivation, slurred speech, tremor, vertigo, urinary retention, blurred vision. Paradoxical reactions such as acute hyperexcited states, anxiety, hallucinations, increased muscle spasticity, insomnia, rage, sleep disturbances, stimulation have been reported; should these occur, discontinue drug. Isolated reports of neutropenia, jaundice; periodic blood counts and liver function tests advisable during long-term therapy.

Dosage: Individualize for maximum beneficial effect. *Adults:* Tension, anxiety and psychoneurotic states, 2 to 10 mg b.i.d. to q.i.d.; alcoholism, 10 mg t.i.d. or q.i.d. in first 24 hours, then 5 mg t.i.d. or q.i.d. as needed; adjunctively in skeletal muscle spasm, 2 to 10 mg t.i.d. or q.i.d.; adjunctively in convulsive disorders, 2 to 10 mg b.i.d. to q.i.d. *Geriatric or debilitated patients:* 2 to 2½ mg, 1 or 2 times daily initially, increasing as needed and tolerated. (See Precautions.) *Children:* 1 to 2½ mg t.i.d. or q.i.d. initially, increasing as needed and tolerated (not for use under 6 months).

Supplied: Valium® (diazepam) Tablets, 2 mg, 5 mg and 10 mg; bottles of 100 and 500. All strengths also available in Tel-E-Dose® packages of 1000.

Valium®
(diazepam)

To help you manage excessive psychic tension

"*. . . I have been impressed by the number of physicians who are involved, who want to become involved or who want to know how to become involved.*"

Remarks of
Walter T. Gunn, M.D., President

Walter T. Gunn, M.D.

Mr. Speaker, Officers, Members of the House of Delegates and Friends:

I closed my talk before this House last year with the challenge, "Get Involved." That challenge, I believe, remains valid. Involvement is the life blood of an Association and without it we have nothing.

I might add, however, that while traveling around the state to county and district meetings and attending several national meetings during the past year, I have been impressed by the number of physicians who *are* involved, who *want* to become involved or who want to know *how* to become involved. Not all, due to individual circumstances, can serve the Association and the profession in the same way, but very, very few are not concerned or not interested in the problems which we face as physicians.

Don't let this deceive you into thinking that since there is concern and interest, we are all pulling in the same direction. It is obvious we are not. This, of course, is not a problem unique to medicine; all organizations and associations experience it.

Why, then, should we physicians strive to accomplish a task that few other groups can do? There are two basic reasons—Washington and Jefferson City! Legislation which would affect our profession seems to crop up in a disproportionate share in our capitols. And, while the pressure on our profession mounts, what do we see but more and more splinter groups emerge that siphon off needed strength while, at the same time, not offering better solutions to the problems.

Your county, state and national medical associations are not perfect, but they are the best and most effective tools we have today. By working constructively from within these already viable organizations, we provide strength *now* when it is most vitally needed.

It has been a great privilege for me to make new and renew old acquaintances with physicians during my term as President. I also feel that we can point to improvements in our State

Association which will benefit all MSMA members for years to come. These forward steps are not attributable to me, but rather to you as Members of the House, your Officers and Councilors and the Membership-at-Large.

I would like to express my sincere thanks to the committee members and individual physicians who have sacrificed time and effort for our Association during the past year. Someone must be responsible for getting the work done, and these physicians never hesitate to do the job.

I think we have seen an improvement in our dealings with our lawmakers in Washington and in the Missouri General Assembly. We don't always "get our way," but we are heard. This is a task in which all MSMA members must become better informed and more active. Let's face it. Your vote, your time and, yes, your contributions mean much to your elected representatives. MMPAC, of course, provides us with a much needed outlet. I, personally, hope that each of you, if you are not already a member, will join MMPAC and AMPAC and urge your colleagues to do so. Also, each of us should take the time to become personally acquainted with our legislators.

The MSMA Headquarters Building, which this body provided for last year, is definitely going to be a plus for our Association. Our new home, which should be ready for occupancy within a month, is located across the street from the Governor's Mansion and two blocks from the State Capitol Building. This is the *Headquarters of all MSMA members.* You and the members in your area are encouraged to stop by to discuss matters of importance or merely become better acquainted with the staff and its work.

Also in the past year, your State Association has worked with the State Department of Education, State Division of Health, Missouri Parent-Teacher's Association and Osteopathic Association to develop first a venereal disease curriculum and, in the future, a comprehensive health education curriculum for Missouri's schools.

We also have worked with the Division of Health on an ongoing project to determine health manpower needs in the state, have cosponsored timely conferences with the JCAH and the Large and Small Hospital organization and have attended and had input into many, many meetings dealing with health-related subjects.

Another high note this past year, to which we can all point with pride, has been the Missouri State Medical Foundation's record-setting $70,000 in loans to 119 medical students in the state.

These activities, of course, represent only a fraction of the day-to-day routine carried out by your State Association. The Association can offer more or different services, and component societies and individual members are invited and urged to provide suggestions and participation.

To return to my original thought, I believe the most important ingredient for the success of your State Association is *involvement.* I feel that the Association is doing a fine job now. But, it can do even more if all of us here today and all those members who we represent will become more involved in organized medicine at all levels.

"Let Unity be the watchword of the future."

E. A. Stricker, M.D.

Remarks of
E. A. Stricker, M.D., President-Elect

Mr. Speaker, Officers, Members of the House of Delegates and Guests:

It will not be an easy task to follow my good friend and predecessor, Walter Gunn. He has been an energetic and dynamic figure in Missouri medicine this past year. He is to be commended for the leadership he has given us, and I hope to call on him during the ensuing year for his advice and counsel.

I have been on the Council since 1960 and have found the Officers and Councilors to be a conscientious and dedicated group, who work long hours in your behalf. I have no qualms about the future of our society when we have men of this caliber steering the operation of our Association. With a team so dedicated to the principles of our profession, we should be able to resolve any problems which we may encounter in the year ahead.

Let Unity be the watchword of the future.

Because problems we still do have. We are living in a fast-moving, restless society. Medicine is still under fire from all angles. There are cries of increased health care costs, lack of doctors in ghetto and rural areas, health care crises of all kinds. We are constantly confronted with new proposals which may affect the practice of medicine and our way of life. Two pressing problems are the PSRO law, with its requirements for continued medical education and peer review, and the new bills for national health insurance and health maintenance organizations (HMOs). Other immediate problems are unfair price curbs on medicine, venereal disease, abortion legality, physicians' unions or guilds, acupuncture and the clamor for more representation by youth, women and minorities.

Despite the fact that a strong and unified effort is so important in coping with these problems, there is a declining ratio of members in our state and national organizations to the total physician population. We can improve upon this, just as we are making progress in other areas. Our rapport with the news media is much improved. Through AMPAC and MMPAC, we now have good communication with legislators at state and national levels.

We can continue to progress, but only if we work together and understand each other. You as delegates are all aware of this or you would not be here. It takes a lot of time and brain power, and you are giving it to make your state medical organization function as a unit. It takes a lot of sharing of ideas and opinions, and I'm sure we will all be plenty vocal.

Well, that's good. Let's be vocal in ways that will do some good. Let's not just "cuss"; let's discuss. In order to coordinate our efforts, we must be able to communicate more effectively to the public and within our profession. Let's talk to our colleagues at home and tell them what we are doing. Get them to support MSMA and AMA and strengthen the voice we can and must have in proposed medical programs.

Welcome to those of you who are delegates for the first time. You may be here because you like what we're doing and want to help. You may be here because you dislike some MSMA policies and want to change. Either way—good for you! You're working and are working within the system. We're glad to have your input.

Bring us names of new and young members of your local medical society for committees. We can use their ideas, their energy and their

Mrs. Keith D. Jones

"Our greatest emphasis this year has been to make women more knowledgeable in the fields of legislation, public affairs and politics."

Report of

Mrs. Keith D. Jones

President of the Woman's Auxiliary

Mr. Speaker, Mr. President, Members of the House of Delegates and Guests:

It is with great pleasure that I bring a report of the Woman's Auxiliary. Our women have accepted the responsibility of viewing their problems within their community and, with initiative, they have worked to solve them. One of my greatest privileges in this office is the opportunity to visit our county and district auxiliary meetings. I was quite impressed to see that our women were on the job working to improve health education within the community.

We cosponsored with the MSMA Council the first statewide health education day on October 25. This was held in conjunction with our Annual Fall Conference. More than 70 state organizations were invited to participate at this meeting. Our program was selected by the Woman's Auxiliary to the AMA as a pilot for the other 49 states. Our goal was to assess the community needs and see how we could help. Our counties have been selective. They have exemplified those qualities of independent thought and individual commitment which are so necessary to move the Auxiliary to a point where it is a vital force for community health and a real helping hand to the physician. We have assisted in the 19 PTA workshops on drugs, venereal disease and sex education. Projects assumed under Health Education, in which notable work has been done to make voluntarism in Missouri highly successful, are in the areas of immunizations, blood donor recruitment, mental health, safety, drug abuse, alcohol campaigns, home care programs, meals-on-wheels and all forms of environmental help.

American Medical Association-Education Research Foundation contributions have increased from $3,000 last year to more than $11,000. Your direct contributions are being credited to the Auxiliary, making us the 22nd state with this joint effort.

You have been so kind to us this year, and at this time, we would like to present to you this check from the Auxiliary for the Missouri State Medical Foundation in honor of Doctor's Day, March 30. We are pleased to have increased this amount from $300 last year to a total of nearly $2,500 at this time. We held our first benefit dinner for the Foundation on October 24 at a joint meeting with the Fifth District Councilor meeting.

Our greatest emphasis this year has been to make our women more knowledgeable in the fields of legislation, public affairs and politics. After representing the Auxiliary the past two years at the American Medical Political Action Committee Workshop in Washington, I, personally, realized that we in Missouri needed to become more involved. To give a few highlights, we created a Public Affairs and PAC chairmanship, and we sold more than 100 women PAC memberships, a 1,000% increase. Today, I would like to impress upon you that if you have not joined AMPAC and MMPAC, a family membership is only $40. Organized medicine needs all the friends we can secure, and with these funds, we can help to elect friends of medicine.

We had our first Ladies Day at the Legislature and our second is planned for April 11. We featured legislation at our Fall Conference, where both gubernatorial candidates addressed us. We also plan to have our first Champagne Public Affairs Breakfast tomorrow at the Starlight Roof at 7:45 a.m. Dr. James Sammons, Vice-Chairman of the AMA Board of Trustees, will speak on the "Here and Now of Politics." Come be our guests, but do sign a list at the registration desk. We are working through a Legislative Effort Group System to help notify legislators. We have 26 women who, with a telephone call, will contact another ten and suddenly we have a force of 260 or 2,600 to write letters or make telephone calls when needed.

To inform you of all the projects which have been accomplished by our women this year would make this report much too lengthy, so I have only touched upon a few of the outstanding ones.

We sincerely want to thank you for your support and guidance. We appreciated being included at the Council meetings and having the opportunity to make a report to the Council of our activities. We feel that we have certainly bridged the communications gap this year.

The thing that stands out predominantly in all my observations is that Missouri doctors' wives were outstanding women and hard working women, but basically wives, mothers and homemakers who take time and effort to make their own home towns better places in which to live for all the people. Because of their concern, as expressed by their good works, the image of Missouri physicians undoubtedly has taken on a higher luster. We cannot foresee what brilliant achievements may be attained by this Auxiliary in the name of the physicians of Missouri.

Remarks of President-Elect

(Continued from page 397)

enthusiasm. Let's welcome participation by interns and residents, too. They have much to contribute and they may find that our "Establishment" does function and can speak as one strong voice.

Encourage your wives to join the state Auxiliary, so that their voices can be heard, also. The Auxiliary is very active in Missouri and is helping MSMA in many ways.

Fortunately, we have an extremely capable and interested staff at both the state and national level to keep us alerted to new bills, to act as liaison with our legislators and with the news media and to carry out the thousand and one details of our decisions.

But, it is up to this group of delegates to make those decisions, to agree on progressive action that will reestablish doctors as leaders of the fight for quality medical care for their patients.

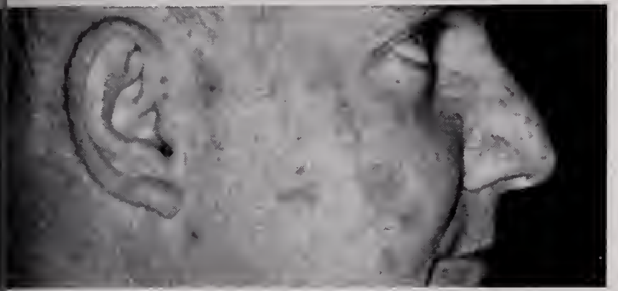
What's on your patient's face...

may be more important than
his chief complaint

he lesions on his face may
solar/actinic – so-called
nile" keratoses...and
ey may be premalignant.

lar, actinic or senile keratoses

ese lesions may be called by several names, but they
ally can be identified by the following character-
cs: the typical lesion is flat or slightly elevated, of a
wnish or reddish color, papular, dry, rough, adherent,
sharply defined. They commonly occur as multiple
ons, chiefly on the exposed portions of the skin.



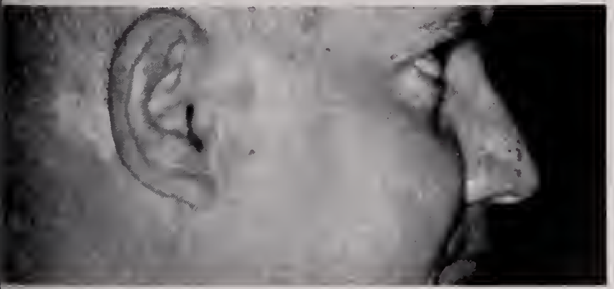
ient P.T. seen on 3/29/67 shows typical lesions of*
derately severe keratoses. Note residual scarring on
ge of nose from previous cryosurgical and electro-
gical procedures.

quence of therapy/
lectivity of response

er several days of therapy with Efudex® (fluorouracil),
thema may begin to appear in the area of the lesions;
reaction usually reaches its height of unsightliness
d discomfort within two weeks, declining after dis-
tinuation of therapy. This reaction occurs in affected
as. Since the response is so predictable, lesions that
not respond should be biopsied.

cceptable results

atment with Efudex provides highly favorable cos-
tic results. Incidence of scarring is low. This is
ticularly important with multiple facial lesions.
udex should be applied with care near the eyes, nose
d mouth.



tient P.T. seen on 6/12/67, seven weeks after discon-*
uation of 5%-FU cream. Reaction has subsided.
sidual scarring not seen except for that due to prior
rgery. Inflammation has cleared and face is clear of
ratotic lesions.

ta on file, Hoffmann-La Roche Inc., Nutley, N.J.

Before prescribing, please consult complete product information, a summary of which follows:

Indications: Multiple actinic or solar keratoses.

Contraindications: Patients with known hypersensitivity to any of its components.

Warnings: If occlusive dressing used, may increase inflammatory reactions in adjacent normal skin. Avoid prolonged exposure to ultraviolet rays. Safe use in pregnancy not established.

Precautions: If applied with fingers, wash hands immediately. Apply with care near eyes, nose and mouth. Lesions failing to respond or recurring should be biopsied.

Adverse Reactions: Local – pain, pruritus, hyperpigmentation and burning at application site most frequent; also dermatitis, scarring, soreness and tenderness. Also reported – insomnia, stomatitis, suppuration, scaling, swelling, irritability, medicinal taste, photosensitivity, lacrimation, leukocytosis, thrombocytopenia, toxic granulation and eosinophilia.

Dosage and Administration: Apply sufficient quantity to cover lesion twice daily with nonmetal applicator or suitable glove. Usual duration of therapy is 2 to 4 weeks.

How Supplied: Solution, 10-ml drop dispensers – containing 2% or 5% fluorouracil on a weight/weight basis, compounded with propylene glycol, tris(hydroxymethyl)aminomethane, hydroxypropyl cellulose, parabens (methyl and propyl) and disodium edetate.
Cream, 25-Gm tubes – containing 5% fluorouracil in a vanishing cream base consisting of white petrolatum, stearyl alcohol, propylene glycol, polysorbate 60 and parabens (methyl and propyl).

This patient's lesions were resolved with

Efudex®
(fluorouracil)

5% cream/solution

Must vasodilators and therapy for other diseases come into conflict?

not if the vasodilator is

VASODILAN®

(ISOXSUPRINE HCl)

the compatible vasodilator… no treatment conflicts reported

The cerebral or peripheral vascular disease patient often has coexisting disease[1] which calls for another drug along with his vasodilator. It may be a hypoglycemic, miotic, antihypertensive, diuretic, anticoagulant, corticosteroid, or coronary vasodilator.

Vasodilan is not incompatible with any of these drugs—no treatment conflict has been reported. And, unlike other vasodilators, Vasodilan has not been reported to affect carbohydrate metabolism, liver function, or intraocular pressure—or to complicate treatment of diabetes, hypertension, peptic ulcer, glaucoma, or liver disease.

In fact, there are no known contraindications to the use of Vasodilan in recommended oral doses, other than that it should not be given in the presence of frank arterial bleeding or immediately postpartum.

Indications: Based on a review of this drug by the National Academy of Sciences-National Research Council and/or other information, the FDA has classified the indications as follows:

Possibly Effective:

1. For the relief of symptoms associated with cerebral vascular insufficiency.
2. In peripheral vascular disease of arteriosclerosis obliterans, thromboangiitis obliterans (Buerger's Disease) and Raynaud's disease
3. Threatened abortion.

Final classification of the less-than-effective indications requires further investigation.

Composition: Vasodilan tablets, isoxsuprine HCl, 10 mg. and 20 mg.

Dosage and Administration: 10 to 20 mg. three or four times daily.

Contraindications and Cautions: There are no known contraindications t oral use when administered in recommended doses. Should not be given immediately postpartum or in the presence of arterial bleeding.

Adverse Reactions: On rare occasions, oral administration of the drug h been associated in time with the occurrence of severe rash. When rash appears, the drug should be discontinued. Occasional overdosage effect such as transient palpitation or dizziness are usually controlled by reducing the dose.

Supplied: Tablets, 10 mg.—bottles of 100, 1000, 5000 and Unit Dose; 20 mg.—bottles of 100, 500 and Unit Dose.

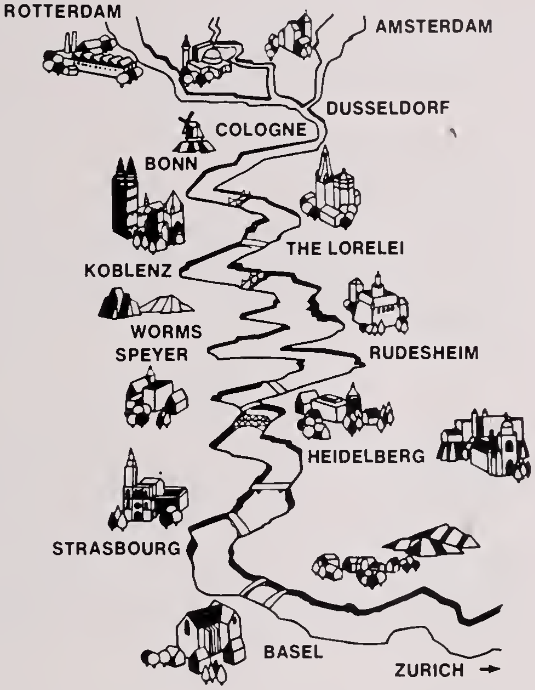
Missouri State Medical Association presents for its members and their families

Rhine Escape

11 Days in the Heart of Europe Featuring a Luxurious 5 Day Cruise Through Holland, Germany, France and Switzerland.

$569 inclusive



The Great Escape! Imagine an exciting four-country cruise through Holland, Germany, France and Switzerland along the Mighty Rhine. It's individualized service all the way from your chartered jet to your deluxe hotel accommodations in Amsterdam and Zurich for a fun-filled holiday of shopping, sightseeing and nightlife.

Your Rhine cruise ship takes you through the most beautiful and romantic parts of Europe. See fairytale castles! Explore medieval towns that haven't changed in thousands of years! Sample the great Rhine wines from lush mountain vineyards!

You'll travel in a spacious deluxe outside cabin with private bath; enjoy cuisine from all of Europe as well as American specialties. The continental service meets the most demanding standards. There will be fresh flowers in your cabin every day and a hospitality desk throughout your stay for individual and group sightseeing arrangements.

It's an unforgettable experience!

Minutes of the
115th Annual Session
MISSOURI STATE MEDICAL ASSOCIATION
House of Delegates
Chase-Park Plaza Hotel, St. Louis
March 29-April 1, 1973

FIRST SESSION

The First Session of the House was called to order at 1:30 PM on March 29, 1973 in the Khorassan Room with E. D. Imes, Speaker, presiding. The following officers, councilors and delegates were present during the 115th Annual session:

Officers

President	Walter T. Gunn, St. Louis
President-Elect	E. A. Stricker, St. James
Vice-President	Paul F. Max, St. Louis
Vice-President	C. A. McBurney, Slater
Vice-President	Truman B. Schertz, N. Kansas City
Secretary	John I. Matthews, Jefferson City
Treasurer	Charles R. Gulick, St. Louis
Speaker of the House	E. D. Imes, Maryville
Vice-Speaker of the House	R. A. Slickman, Kansas City
Immediate Past-President	Gerald L. Miller, Kansas City

Councilors

1st District	John N. Martin, St. Joseph
2nd District	Lysle M. Bach, Hannibal
3rd District	Max S. Franklin, St. Louis
4th District	Louis P. Hetlage, Troy
5th District	James C. Cope, Columbia
6th District	William D. Bradshaw, Clinton
7th District	R. Allen Chandler, Kansas City
8th District	Howard J. McAlhany, Springfield
9th District	Claude W. Cooper, Thayer
10th District	Eugene T. Hansbrough, Poplar Bluff

Mr. Merlin Brown, University of Missouri-Kansas City School of Medicine
Mr. James Barton, Washington University School of Medicine
Mr. Barry Farber, Washington University School of Medicine
Mr. Ira M. Rutkow, St. Louis University School of Medicine
Mr. John P. Jones, St. Louis University School of Medicine
Mr. Orlyn Lockard, University of Missouri-Columbia School of Medicine
Mr. John Brandt, University of Missouri-Columbia School of Medicine

The invocation was given by Association President Walter T. Gunn.

Dr. F. Eugene Pennington, Chairman of the Credentials Committee, reported that satisfactory credentials thad been presented by nine officers, ten councilors and 125 delegates. He informed the House that this number of delegates constitutes a quorum and dispensed with a roll call.

Dr. Max Franklin, Chairman of the Committee on Arrangements, welcomed the Association members, their wives and guests to the 115th Annual Session and expressed the hope for a successful meeting.

The Speaker then introduced Dr. James Sammons, Vice-Chairman of the AMA Board of Trustees and a distinguished guest at the Annual Session.

The minutes of the 114th (1972) Annual Session, which were published in the July 1, 1972 issue of MISSOURI MEDICINE, were approved as published.

The Speaker announced appointment of the following reference committees and presented his instructions to the committees:

ON AMENDMENTS TO THE CONSTITUTION AND BYLAWS

Robert H. Felix, St. Louis, Chairman
William R. Richardson, Union
Roy E. Kenney, Neosho
Robert F. Dettmer, Ironton
F. A. Barnett, Paris

ON RESOLUTIONS

Robert A. Mayer, St. Louis County, Chairman
Jack N. Wiles, West Plains
R. John Torontow, Nevada
F. Eugene Pennington, St. Louis
T. J. Bryant, Kansas City

ON REPORTS OF OFFICERS

MacDonald Bonebrake, Springfield, Chairman
Carol F. Williams, St. Louis
Richard P. Bowles, Liberty
Robert H. Tanner, Jefferson City
Ronald A. Youmans, Kansas City

ON MISCELLANEOUS AFFAIRS

E. Warren Allen, Carrollton, Chairman
Joseph B. Vacca, St. Louis
John C. Soucy, St. Charles
O. Dale Smith, Prairie Village, Kan.
Thomas M. Macdonnell, Marshfield

ON MEDICAL EDUCATION AND PUBLIC WELFARE

Andrew McCanse, Kansas City, Chairman
Benedict A. Moranville, Columbia
Edwin K. Burford, Jr., Cape Girardeau
E. J. Cunningham, Jr., St. Louis County
Richard V. Bradley, St. Louis

ON NECROLOGY

T. Eugene Ruff, Poplar Bluff, Chairman
Ruth Kauffman, Versailles
David N. Kerr, St. Louis
Gordon C. Sauer, Kansas City
E. E. Wadlow, St. Joseph

The Speaker introduced Dr. Gunn who delivered the annual President's Message.

(The President's Message is published on page 395.)

The Speaker then asked Dr. E. A. Stricker to present the annual message of the incoming President.

(Dr. Stricker's address is published on page 397.)

(Both Presidential messages were referred to the Reference Committee on Reports of Officers.)

The Speaker then invited Mrs. Keith D. Jones to present the annual report of the President of the Woman's Auxiliary.

(This report is published on page 398.)

(Mrs. Jones's report was referred to the Reference Committee on Reports of Officers.)

The Speaker stated that the reports of the Health Care Foundation of Missouri, Officers, Committees, Commissions and Council were published in the Delegates Handbook and referred the reports to the appropriate reference committees. He asked for any supplementary reports from committee and commission chairmen. There were no supplementary reports.

The Speaker then requested any supplementary report of the Council. He referred the various subjects within the Supplementary Report of the Council to appropriate reference committees.

Park Plaza
HOTEL

Dr. E. D. Imes, Speaker of the House of Delegates, declares the 115th Annual Session of the Missouri State Medical Association open as he calls the House to order on March 29, 1973. Seated *(left to right)* are MSMA President Walter T. Gunn, President-Elect E. A. Stricker and Vice-Speaker R. A. Slickman.

(This report is published on page 483.)

The reports of the Health Care Foundation of Missouri, Officers, Committees, Commissions and Council are as follows:

REPORT OF THE HEALTH CARE FOUNDATION OF MISSOURI

During the calendar year 1972 and the first two months of 1973, the Health Care Foundation of Missouri struggled with several major problems. This report will cover seven major areas of activity, which have led to some feeling of accomplishment and identification of future purpose of the Health Care Foundation, but with a distinct feeling that all problems have not been solved and that much more remains to be done.

In January, 1972, the Board of Directors clearly recognized that the initial seed monies, which had been basically the sole source of funding for the Health Care Foundation, would have to be supplemented substantially if, indeed, the Foundation was to grow and mature. A multilateral approach was attempted and met with varying degrees of success.

Various private foundations throughout the state were contacted, in particular, were Mr. Homer Wadsworth of Kansas City, President of the Kansas City Association of Trusts and Foundations, representing more than 25 private foundations; and Mr. Richard Dunlop of St. Louis, who represented more than 35 private foundations. Both of these gentlemen expressed much interest in the activities of the Health Care Foundation, but none were able to relate to the Foundation financially because of an inappropriate IRS tax designation. Negotiations were reopened with IRS in St. Louis to achieve a more favorable classification, and, as of the time of this report, the desired 501(c)(3) designation has still not been granted but appears to be within our grasp within the near future. This will make the Health Care Foundation a most appropriate depository for private giving, with complete release of the donor from any obligation to justify the financial support given.

The commercial health insurance industry through the Health Insurance Council was contacted, and a meeting was held in Kansas City on March 30 by representatives of the Health Care Foundation and representatives of HIC from both New York and Chicago. A great deal of optimism was expressed by the representatives of HIC that financial support on a pro rata basis from the larger companies doing a significant percentage of the health care insurance business in Missouri would be forthcoming. However, this meeting led to the establishment of a task force of their member companies, which task force was not even appointed until September, and the end result of all of these negotiations to date has been essentially zero. The HIC task force has been unable to develop a plan that would permit equitable funding from their standpoint, in spite of many reassurances which have been given verbally and in writing to the contrary.

The four Blue programs in the state of Missouri have been contacted both personally and in writing regarding continued support of the activities of the Health Care Foundation. As may be remembered, the two Blue Shield programs in Missouri were responsible for the major provision of seed money when the Health Care Foundation was first started in 1970. As the result of the recent contacts in 1972 to the four plans, Kansas City Blue Shield did make a second contribution, which was considered their appropriate fair share on the basis of premium dollars engendered in Missouri by the major carriers (Blues and otherwise). In spite of continuing negotiations with Blue Shield of St. Louis and the two Blue Cross pro-

What Missouri doctors need is a Malpractice Liability Carrier that won't fade when trouble comes.

grams in the state, no further contributions have been forthcoming.

Early success has been met by initial discussions with several large management groups in western Missouri. To date we have had a very favorable response from all of them and negotiations are still continuing in an atmosphere of optimism. To support this optimism, two large companies have already given considerable financial support to the Foundation for a year's evaluation of our activities and the ability of the Health Care Foundation to help monitor quality of care as provided for employees of these corporations and to control costs, as this may become necessary.

The Missouri Regional Medical Programs have long expressed their interest in helping the Health Care Foundation, particularly as it relates to evaluation studies of the quality of care in Missouri, as to the identification of educational needs resulting from such evaluation, and for developing, through the University of Missouri, computerization of those portions of the program conducted by the Health Care Foundation which lend themselves to computer analysis. In June, 1972, the Health Care Foundation developed a program which has been ongoing since September and which has been funded on a monthly basis at the level of $2,000 a month, as pilot project reports have been prepared and reviewed. During these negotiations with Missouri Regional Medical Programs, the Health Care Foundation was encouraged to expand its proposals and to apply for a grant through Regional Medical Programs to become effective in August, 1973. Such a proposal has been drafted, reviewed and accepted with some modifications. The various advisory Comprehensive Health Planning agencies in the state have had to pass on this proposal, and very favorable responses have been forthcoming from them. The State Regional Advisory Council to Missouri Regional Medical Programs has approved a grant beginning in August 1973, pending approval of the National Regional Medical Programs Advisory Council and that of HEW. This was the source of continuing encouragement to the Health Care Foundation, until recent severe budgetary cut-backs recommended by President Nixon, which may very well delete any long-range future funding by any Regional Medical Program. As of the time of the preparation of this report, it appeared rather dubious that there would be any new grants funded by HEW through Regional Medical Programs, and this one aspect of our financial support very probably will not come to be.

Having had the support of the Missouri Association of Osteopathic Physicians and Surgeons ever since the founding of the Health Care Foundation to seek federal dollars for operational support, it was possible to gain similar support from the Council of Missouri State Medical Association to permit the Health Care Foundation to apply for an EMCRO grant. Meetings were held with representatives of HEW in Kansas City relative to the development of such a proposal. With considerable help from the staff of Missouri Regional Medical Programs, an appropriate draft for an EMCRO grant was submitted in early January of 1973. Funds for this grant are definitely available if the grant is approved, but final action by the National Review Committee on all such grants will not be rendered until probably late April or early May, 1973. If, indeed, the Health Care Foundation's grant is funded, money should be available for active utilization by the Health Care Foundation by July 1 1973.

In October, the Board of Directors, fully recognizing that funds were being strained to the maximum, decided that all Participating Members of the Health Care Foundation would be asked to make a voluntary contribution of $20 or more to help keep the Foundation alive and viable until the many other sources of funding became a reality. The result was that by the end of 1972, approximately $15,000 had been contributed by these member physicians on a voluntary basis, many of them contributing more than the requested $20, with some donations being as high as $100. The Radiological Society of Missouri contributed $500.

The financial resources of the Foundation still are not at anywhere near the level which will permit expansion of the activities of the Foundation to the desired level, because of inability to pay adequate salaries to sufficient people to expand these activities. However, the situation appears somewhat more optimistic at this point in time in view of what I have already said, and what will be said later on in this report.

A change in the Bylaws passed in early September of 1971, changing the membership of the Health Care Foundation from an automatic one to one of voluntary participation, necessitated a statewide membership drive which was begun late in 1971 and was not really fully mounted until January of 1972. As the result of this solicitation of physicians in the state of Missouri, regardless of their membership in the Missouri State Medical Association or the Missouri Association of Osteopathic Physicians and Surgeons, a total physician membership of 2,658 was achieved. This represents approximately 57% of the M.D.s and 64% of the D.O.s for an overall total membership in excess of 59% of the active practicing physicians who were solicited in the state of Missouri. It is planned that another membership drive will be undertaken in the spring of 1973 to expand this membership.

During 1972, the Central Coordinating Committee of the Health Care Foundation under the Chairmanship of Dr. Clem Grebel, working with the specialty societies throughout the state, developed its own procedural guidelines for use by hospitals, insurance carriers, physicians and others. By the end of 1972, an almost entirely complete set of such guidelines had been submitted, and Dr. Grebel and the Central Coordinating Committee have just recently completed preparing them for publication. As has been said before, these guidelines are, indeed, nothing but guidelines of proper diagnosis and treatment and are not rigid formats. They do permit and allow for the individual variations that each patient will present with a given problem, and the individual variations which any one example of a given disease entity will demonstrate in the course of diagnosis and treatment. It is the continuing responsibility of the Central Coordinating Committee to monitor these guidelines and revise them periodically in order to maintain the highest possible quality of care for the patients of this state. It should be stated again for emphasis that these guidelines do not in any way direct their attention to the matter of fees charged for services rendered.

As mentioned earlier in this report, a research project was developed with the help of Missouri Regional Medical Programs in an attempt to discover educational deficiencies and to recommend educational programs that would help resolve these deficiencies. The research approach to the project was to analyze each case that had been submitted to the Foundation for peer review to determine what the basic problem was as it related to appropriateness, quality, utilization, the mode of treatment and the cost. To supplement this data base, a Project Review Committee composed of Drs. Clem Grebel, John Matthews, and Robert Bregant launched a pilot study among physician members of the Health Care Foundation of Missouri to see if, indeed, these physicians would respond to an HCFM survey, and if they would respond, would such a survey approach yield significant data. The result of this investigation demonstrated that not only would the physicians respond, but that such a survey would yield significant data. Heartened by this initial experiment, the Foundation is now beginning to develop more meaningful surveys among its physician members that will assist the Foundation in its communications as well as in its educational programs.

The EMCRO project mentioned above, if it is accepted, will focus on the optimal programming for inpatient disease management. This project has arisen out of Foundation meetings with Missouri Regional Medical Programs, University of Missouri physicians, as well as with a study committee of the Joint Commission on Accreditation of Hospitals, from which should be evolved relatively soon a joint involvement of all organizations mentioned, particularly the Health Care Foundation, to be pursued in the hospital setting. Using the current available guidelines of the Health Care Foundation, plus more sophisticated revisions within the hospital framework, and employing a computer data base and using a health care analyst as the initial reviewer who will work with original hospital records, personnel, and staff physicians, it is quite apparent that when this becomes an ongoing activity it should do much to identify educational needs as far as inpatient hospital care is concerned, control unnecessary hospital admissions, reduce hospital stays and provide overall elevation of the optimum care which patients in the hospital setting will receive. This project has originally been started by Drs. Robert Mosser and Ed Twin at Kansas City General Hospital as a pilot project, and it is anticipated within the current 12-month period that it will be expanded to other larger community hospitals and, eventually, to the smaller hospitals in the nonurban areas.

In conjunction with this aspect of the Foundation's activities, the Foundation itself launched its own utilization review service that was designed primarily to relate to those smaller community hospitals that were having difficulties in providing adequate utilization review. In response to an initial letter to hospital administrators and chiefs of staff in all hospitals of Missouri, a rather positive response was obtained. Almost 30 hospitals have directly contacted the Foundation to ask them to meet with them and discuss this utilization review service. It is still in the experimental stage, but the initial reactions of those physician teams which have worked on the hospital utilization reviews at the request of these hospitals and their chiefs of staff has been most encouraging.

A great deal of time was spent during the past 12 months by the Health Care Foundation in evaluating its effectiveness of providing peer review in the Panel Areas. The lag time between the reception of a complaint from some party and the eventual processing of this complaint and arrival at an initial recommendation has still been too long as far as the Health Care Foundation has been concerned, as well as those parties such as physicians and insurance carriers with whom we have worked. We do believe, however, it has been improved considerably and should continue to do so. With adequate funding and the provision of more staff personnel to effect these reviews, the load on the physician members of the Panels and the lag time should continue to decrease. One concept which has been used on an experimental basis in Panel A, located in Kansas City, and Panel C, located in St. Louis, has been to subdivide the Panel Review teams into primary care panels and surgical panels, thus giving a little more specialized review of the cases submitted and still not losing the advantages of the conglomerate approach.

Much time on the part of staff and officers of the Foundation has been spent in trying to achieve better professional relations with third party payors. While there have been many difficulties in dealing with the Medicaid situation, of special note is the fact that there has been an increasingly satisfactory rapport with the Division of Welfare, and, with the passage of Public Law 92-603 and particularly the amendment more commonly referred to as HR-1 with its inclusion of the Professional Standards Review Organization, third party payors have been much more receptive to our overtures as it relates to future activities between those organizations and the Health Care Foundation. The Foundation has worked diligently to accommodate the implied changes in this PSRO legislation and still maintain a posture that would reflect the needs of the physicians of Missouri and their patients.

At the present time, there has been a major revision again of the Bylaws of the Health Care Foundation, which will be made official in the very near future. This has been done to restructure the Health Care Foundation and its five Panel Review Areas in the state of Missouri to accommodate the anticipated implementation of HR-1. These Bylaws should provide for a much more democratic organization than has existed heretofore. The Foundation will function independently from organized medicine, although all segments of organized medicine will have major input into the operation of the Foundation, and the Foundation will involve all physicians of Missouri regardless of membership in either of the two statewide physician organizations.

Inasmuch as no rules or regulations have been developed by the Department of HEW to implement the Professional Standards Review Organization, and feeling that, at least in Missouri, the Health Care Foundation has made some strides toward attempting to provide peer review; that with appropriate structural changes as set forth in the new Bylaws, it is not totally unrealistic to hope that, indeed, the Secretary of HEW after more thorough investigation and communication with the Health Care Foundation, will feel this could well be the basis for establishment of appropriate PSRO's in the state of Missouri. In spite of some of the concerns which individual physicians and organized medicine as a whole have held and still hold regarding this legislation, it is, nevertheless, totally apparent to those who have studied the matter thoroughly that, indeed, the physicians of this country will have to respond to the increased challenge which this legislation presents if we are, indeed, to maintain any control over the destiny of our profession and the patients which it serves. Failure to meet this challenge can meet with only one alternative, and that is bureaucratic control over the services which we provide and the manner in which they are provided. This would, indeed, be a sorry day for the profession and for the people of the United States.

The Health Care Foundation is, indeed, an organization that can perform a great service for the physicians of Missouri and their patients. It needs full physician endorsement and cooperation, as well as active participation.

Hector W. Benoit, Jr., M.D., Chairman

(The Speaker referred this report to the Reference Committee on Resolutions.)

Reports of Officers

REPORT OF THE SECRETARY

The Missouri State Medical Association had 4,428 members as of Dec. 31, 1972. This was an increase of 114 members over the previous year.

MEMBERSHIP CHANGES DURING THE YEAR

Members, Jan. 1, 1972		4,314
New Members admitted during year	289	
Reinstated	9	
Total added	298	
Members dropped during year	48	
Deceased	53	
Transferred to other states	70	
Resigned	13	
Total lost	184	
Net Gain		114
Members, Dec. 31, 1972		4,428

The Committee on Nominations, which is appointed by the President from the House of Delegates, must submit nominations for the following offices:

—Three Vice-Presidents to fill the expired terms of Paul F. Max, St. Louis; Charles A. McBurney, Slater; Truman B. Schertz, North Kansas City.

—A Speaker of the House of Delegates and a Vice-Speaker of the House of Delegates to fill the expired terms of E. D. Imes, Maryville, Speaker; and Robert A. Slickman, Kansas City, Vice-Speaker.

—Two Delegates and corresponding Alternates to the American Medical Association to fill the vacancies created by the expiration on Dec. 31, 1973, of the terms of Delegate, Arthur W. Neilson, St. Louis; Alternate, Robert W. Kelley, St. Louis; Delegate, Hector W. Benoit, Jr., Kansas City; Alternate, Hugh E. Stephenson, Jr., Columbia.

—The terms (two years) of the Councilors of the even-numbered districts expire this year. These Councilors are Lysle M. Bach, Hannibal, Second District; Louis P. Hetlage, Troy, Fourth District; William D. Bradshaw, Clinton, Sixth District; Howard J. McAlhany, Springfield, Eighth District; Eugene T. Hansbrough, Poplar Bluff, Tenth District. Delegates from these districts shall meet during the meeting, prior to the last day, and elect the Councilor for their district. The election shall be certified to the House of Delegates on a prescribed form which will be furnished.

The entire session will be held in the Chase-Park Plaza Hotel, St. Louis. The House of Delegates will hold its first session on Thursday, March 29, at 1:30 PM in the Khorassan Room. Reference Committees will meet in committee rooms in the hotel. The second session of the House of Delegates will convene at 4 PM on Friday, March 30 in the Khorassan Room. The final session of the House, a breakfast meeting, will be held in the Khorassan Room at 7:30 AM on Sunday, April 1.

Registration facilities will be open on Thursday, March 29, from 11 AM to 4 PM; on Friday and Saturday from 8 AM to 5 PM; and on Sunday from 7:30 AM to 9 AM. Registration will be in the Regency Room.

John I. Matthews, Secretary

Man in space, now fait accompli, re-emphasizes the importance of Uro-Phosphate therapy. Research into the effect of space travel on the astronaut reveals that weightlessness causes loss of bone calcium. As the bones are required to bear less and less of the weight of the body they lose calcium, increasing the calcium content of the urine. When physical activity is reduced, the acidity of the urine should be adjusted to keep increased calcium in solution . . . . a prophylaxis to prevent kidney or bladder calculi.

Uro-Phosphate®

NOW A SUGAR-COATED TABLET

Each tablet contains: METHENAMINE, *300 mg.;* SODIUM ACID PHOSPHATE, *500 mg.*

Uro-Phosphate gives comfort and protection when inactivity causes discomfort in the urinary function. It keeps calcium in solution, preventing calculi; it maintains clear, acid, sterile urine; it encourages complete voiding and lessens frequency when residual urine is present.

Uro-Phosphate contains sodium acid phosphate, a natural urinary acidifier. This component is fortified with methenamine which is inert until it reaches the acid urinary bladder. In this environment it releases a mild antiseptic keeping the urine sterile.

Uro-Phosphate is safe for continuous use. There are no contra-indications other than acidosis. It can be given in sufficient amount to keep the urine clear, acid and sterile. A heavy sugar coating protects its potency.

Dosage:

For protection of the inactive patient 1 or 2 tablets every 4 to 6 hours is usually sufficient to keep the urine clear, acid and sterile.

2 tablets on retiring will keep residual urine acid and sterile, contributing to comfort and rest.

A clinical supply will be sent to physicians and hospitals on request.

optional therapy

THE mudranes®

All Mudranes are bronchodilator-mucolytic in action, and are indicated for symptomatic relief of bronchial asthma, emphysema, bronchiectasis and chronic bronchitis. **MUDRANE tablets** contain 195 mg. potassium iodide; 130 mg. aminophylline; 21 mg. phenobarbital (Warning: may be habit-forming); 16 mg. ephedrine HCl. **Dosage** is one tablet with full glass of water, 3 or 4 times a day. **Precautions** are those for aminophylline-phenobarbital-ephedrine combinations. **Iodide side-effects:** May cause nausea. Very long use may cause goiter. Discontinue if symptoms of iodism develop. **Iodide contraindications:** Tuberculosis; pregnancy (to protect the fetus against possible depression of thyroid activity). **MUDRANE-2 tablets** contain 195 mg. potassium iodide; 130 mg. aminophylline. **Dosage** is one tablet with full glass of water, 3 or 4 times a day. **Precautions** are those for aminophylline. **Iodide side-effects and contraindications are listed above. MUDRANE GG tablets** contain 100 mg. glyceryl guaiacolate; 130 mg. aminophylline; 21 mg. phenobarbital (Warning: may be habit-forming); 16 mg. ephedrine HCl. **Dosage** is one tablet with full glass of water, 3 or 4 times a day. **Precautions** are those for aminophylline-phenobarbital-ephedrine combinations. **MUDRANE GG-2 tablets** contain 100 mg. glyceryl guaiacolate; 130 mg. aminophylline. **Dosage** is one tablet with full glass of water, 3 or 4 times a day. **Precautions:** Those for aminophylline. **MUDRANE GG Elixir.** Each teaspoonful (5 cc) contains 26 mg. glyceryl guaiacolate; 20 mg. theophylline; 5.4 mg. phenobarbital (Warning: may be habit-forming); 4 mg. ephedrine HCl. **Dosage:** Children, 1 cc for each 10 lbs. of body weight; one teaspoonful (5 cc) for a 50 lb. child. Dose may be repeated 3 or 4 times a day. Adult, one tablespoonful, 4 times daily. All doses should be followed with ½ to full glass of water. **Precautions:** See those listed above for Mudrane GG tablets.

MUDRANE—original formula
First choice

MUDRANE-2
When ephedrine is too exciting or is contraindicated

MUDRANE GG
During pregnancy or when K.I. is contraindicated or not tolerated

MUDRANE GG-2
A counterpart for Mudrane-2

MUDRANE GG ELIXIR
For pediatric use or where liquids are preferred

Clinical specimens available to physicians.

The diabetic who has too much...

too much sugar, too much fat.

Maybe the last thing she needs is more of her own insulin. Especially when you consider that many overweight diabetics already have normal or high levels of endogenous insulin and that insulin is lipogenic.

If she just won't diet and oral therapy is indicated in adult-onset, nonketotic diabetes.

DBI-TD® Geigy
phenformin HCl

lowers blood sugar without raising blood insulin.

For complete details, including dosage, please read the prescribing information. It's summarized below.

I® phenformin HCl
lets of 25 mg.
I-TD® phenformin HCl
ed-Disintegration
sules of 50 and 100 mg.

ications: Stable adult diabetes mellitus; sulfonyl-
a failures, primary and secondary; adjunct to
ulin therapy of unstable diabetes mellitus.
ntraindications: Diabetes mellitus that can be
ulated by diet alone; juvenile diabetes mellitus
t is uncomplicated and well regulated on in-
in; acute complications of diabetes mellitus
etabolic acidosis, coma, infection, gangrene);
ring or immediately after surgery where insulin
ndispensable; severe hepatic disease; renal dis-
e with uremia; cardiovascular collapse (shock);
er disease states associated with hypoxemia.
rnings: Use during pregnancy is to be avoided.
cautions: 1. *Starvation Ketosis:* This must be
erentiated from "insulin lack" ketosis and is
racterized by ketonuria which, in spite of relatively normal blood and urine sugar, may result from excessive phenformin therapy, excessive insulin reduction, or insufficient carbohydrate intake. Adjust insulin dosage, lower phenformin dosage, or supply carbohydrates to alleviate this state. **Do not give insulin without first checking blood and urine sugar.**

2. *Lactic Acidosis:* This drug is not recommended in the presence of azotemia or in any clinical situation that predisposes to sustained hypotension that could lead to lactic acidosis. To differentiate lactic acidosis from ketoacidosis, periodic determinations of ketones in the blood and urine should be made in diabetics previously stabilized on phenformin, or phenformin and insulin, who have become unstable. If electrolyte imbalance is suspected, periodic determinations should also be made of electrolytes, pH, and the lactate-pyruvate ratio. The drug should be withdrawn and insulin, when required, and other corrective measures instituted immediately upon the appearance of any metabolic acidosis.

3. *Hypoglycemia:* Although hypoglycemic reactions are rare when phenformin is used alone, every precaution should be observed during the dosage adjustment period particularly when insulin or a sulfonylurea has been given in combination with phenformin.

Adverse Reactions: Principally gastrointestinal; unpleasant metallic taste, continuing to anorexia, nausea and, less frequently, vomiting and diarrhea. Reduce dosage at first sign of these symptoms. In case of vomiting, the drug should be immediately withdrawn. Although rare, urticaria has been reported, as have gastrointestinal symptoms such as anorexia, nausea and vomiting following excessive alcohol intake. (B) 98-146-103-E (6/72)

For complete details, including dosage, please see full prescribing information.

GEIGY Pharmaceuticals
Division of CIBA-GEIGY Corporation
Ardsley, New York 10502

DBI 9105

What should a medication for sleep be expected to provide?

Before prescribing Dalmane (flurazepam HCl), please consult Complete Product Information, a summary of which follows:

Indications: Effective in all types of insomnia characterized by difficulty in falling asleep, frequent nocturnal awakenings and/or early morning awakening; in patients with recurring insomnia or poor sleeping habits; and in acute or chronic medical situations requiring restful sleep. Since insomnia is often transient and intermittent, prolonged administration is generally not necessary or recommended.

Contraindications: Known hypersensitivity to flurazepam HCl.

Warnings: Caution patients about possible combined effects with alcohol and other CNS depressants. Caution against hazardous occupations requiring complete mental alertness (*e.g.*, operating machinery, driving). Use in women who are or may become pregnant only when potential benefits have been weighed against possible hazards. Not recommended for use in persons under 15 years
of age. Though physical and psychol
dependence have not been reporte
recommended doses, use caution in
ministering to addiction-prone indi
or those who might increase dosage

Precautions: In elderly and debilita
initial dosage should be limited to 1
to preclude oversedation, dizziness
or ataxia. If combined with other dr
having hypnotic or CNS-depressant
effects, consider potential additive e
Employ usual precautions in patien
who are severely depressed, or with

Sleep for 7 to 8 hours without need to repeat dosage during the night

No sleep medication has been as rigorously evaluated in the sleep research laboratory as Dalmane. Insomnia patients given one 30-mg capsule of Dalmane at bedtime, on average: fell asleep within 17 minutes, had fewer nighttime awakenings, spent less time awake after sleep onset, and slept for 7 to 8 hours with no need to repeat dosage during the night.

Sleep with consistency

Dalmane has been shown to be consistently effective even during consecutive nights of administration. Thus there is little likelihood for the need to increase dosage to maintain therapeutic effect.

Dalmane (flurazepam HCl) is a distinctive sleep medication—a benzodiazepine specifically indicated for insomnia. It is not a barbiturate or methaqualone, nor is it related chemically to any other available hypnotic.

Sleep with relative safety

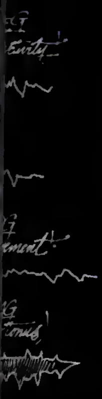
Chronic tolerance studies have confirmed the relative safety of Dalmane; no depression of cardiac or respiratory function was noted in patients administered recommended or higher doses for as long as 90 consecutive nights. Dalmane is generally well tolerated and morning "hang-over" is relatively infrequent. Dizziness, drowsiness, lightheadedness and the like have been the side effects noted most frequently, particularly in elderly and debilitated patients. (An initial dose of Dalmane 15 mg should be prescribed for these patients.)

DALMANE®
(flurazepam HCl)
When restful sleep is indicated

One 30-mg capsule *h.s.*—usual adult dosage
(15 mg may suffice in some patients).
One 15-mg capsule *h.s.*—initial dosage for elderly or debilitated patients.

ROCHE

ROCHE LABORATORIES
Division of Hoffmann-La Roche Inc.
Nutley, New Jersey 07110



depression or suicidal tendencies.
dic blood counts and liver and kid-
nction tests are advised during
ted therapy. Observe usual precau-
n presence of impaired renal or
ic function.

se Reactions: Dizziness, drowsi-
lightheadedness, staggering, ataxia
lling have occurred, particularly
erly or debilitated patients. Severe
ion, lethargy, disorientation and
probably indicative of drug intoler-
or overdosage, have been reported.

Also reported were headache, heartburn, upset stomach, nausea, vomiting, diarrhea, constipation, GI pain, nervousness, talkativeness, apprehension, irritability, weakness, palpitations, chest pains, body and joint pains and GU complaints. There have also been rare occurrences of sweating, flushes, difficulty in focusing, blurred vision, burning eyes, faintness, hypotension, shortness of breath, pruritus, skin rash, dry mouth, bitter taste, excessive salivation, anorexia, euphoria, depression, slurred speech, confusion, restlessness, hallucinations, and elevated SGOT, SGPT, total and direct bilirubins and alkaline phosphatase. Paradoxical reactions, *e.g.*, excitement, stimulation and hyperactivity, have also been reported in rare instances.

Dosage: Individualize for maximum beneficial effect. *Adults:* 30 mg usual dosage; 15 mg may suffice in some patients. *Elderly or debilitated patients:* 15 mg initially until response is determined.

Supplied: Capsules containing 15 mg or 30 mg flurazepam HCl.

It's time the American Med- Association and state and local dical societies paid off the debt by isive action to hold down the cost edical care.”

t of Drugs

Insurance rates and hospital rges are only two factors in health care costs. The cost of drugs—both prescription and nonprescription—is another.

And when it comes to drug costs, the nation's pharmacists *are concerned.* Through their national professional society, the American Pharmaceutical Association, pharmacists are advising the public to use nonprescription medication cautiously and conservatively, and to seek the advice of their pharmacist before selecting or purchasing such drugs.

Outdated Laws

The pharmacist also is aware that when it comes to prescription drugs, often he has an even greater opportunity to reduce the cost to the patient—with no sacrifice in the quality of the medication dispensed. But in many states, outdated and antiquated laws prevent the pharmacist from engaging in drug product selection. “Drug product selection” simply means that the pharmacist functions in the patient's interest by consciously choosing, from the multiple brands available, a low-cost quality brand of the specific drug to be dispensed in response to the physician's prescription order.

Much *misinformation* has been purposely spread by those who stand to gain financially by maintaining high drug costs to the public. An endless stream of propaganda has emanated from the drug industry in an effort to persuade the medical profession that these so-called anti-substitution laws should be retained. And as long as these laws are retained, the drug industry will continue its current marketing practices which contribute unnecessarily to high drug costs to patients. These practices also are inviting government agencies to expand their restrictive controls on physicians and pharmacists.

APhA Efforts

As pharmacists, we are concerned about health care costs. We hope that every physician shares our concern on this vital issue, and will give his personal support to the constructive efforts APhA has undertaken in the interest of all patients.

(For a complete discussion of drug product selection, you are invited to request a free copy of the “White Paper on the Pharmacist's Role in Product Selection” from: American Pharmaceutical Association, 2215 Constitution Avenue, N.W., Washington, D.C. 20037.)

---

30 drugs that he selects to treat the jority of conditions encountered in practice. Moreover, the physi- n's choice of a specific brand is ed on his knowledge of the pa- nt's medical history and current dition, and his experiences with particular manufacturer's duct.

Some substitution proponents e argued that the dispensing of a scription is a simple two-party nsaction between the pharmacist the patient, and that a substitut- pharmacist may avoid even a hnical breach of contract by simply ifying the patient that he is making substitution. I would judge that courts would be sympathetic ard a pharmacist who substituted hout physician approval and who dertook a legal defense that seeks make the patient responsible for pharmacist's actions.

duced Prescription Prices?

Substitution advocates are ggesting to the consumer, and par- ularly the consumer activist, that duced prescription prices could low legalization of substitution. have seen absolutely no evidence ustify this claim. To the contrary, perience in Alberta, Canada, where ostitution is authorized, suggests the opposite.

Many pharmacists understandably are concerned about the cost of maintaining multiple stocks of similar products. While there is no doubt that inventory costs rise when additional brands are stocked, it would be interesting to know how much they rise, and how many pharmacists actually stock *all* brands—of, say, ampicillin or tetracycline—or how long they keep “slow moving” products on their shelves before they are returned for credit. To ask that the industry eliminate multiple sources is to ask competitors to stop competing.

Drug Substitution—A License for the Unethical

Anti-substitution repeal would favor “corner cutting” pharmacists and manufacturers. For them, free substitution would be not a right, but a license. As an aftermath, it is quite likely that the confidence of both physicians and patients in the profession of Pharmacy would be eroded, as revelations about the unconscionable behavior of an undisciplined few were magnified in the press or in professional circles.

Summary

In short, what the American Pharmaceutical Association advocates as a broad-spectrum panacea looks to us to be not only a minority view (advocacy of substitution is by no means a uniform policy in Pharmacy), but also an extraordinarily costly and ineffective remedy, whose side effects are odious. We believe (1) that an impressive majority of pharmacists prefer to work with Medicine and with industry, for the consumer, and for the general good, (2) that they seek the privilege to substitute when the patient might gain and when the patient's doctor agrees, and (3) that they seek to work for the resolution of genuine grievances openly and professionally.

(For amplification of PMA views, please write for our booklet, “The Medications Physicians Prescribe: Who Shall Determine the Source?” It is available from: Pharmaceutical Manufacturers Association, 1155 Fifteenth Street, N.W., Washington, D.C. 20005.)

REPORT OF THE TREASURER

The report of the Treasurer is covered in the Financial Statement which appeared in the March, 1973 issue of Missouri Medicine and in the Delegates Handbook. Therefore, it is not repeated here.

Charles R. Gulick, Treasurer

(Referred to the Reference Committee on Reports of Officers.)

REPORT OF THE EXECUTIVE SECRETARY

Your Headquarters Staff has worked diligently during the past year under the direction of the Council, Officers and various Association Commissions and Committees on the many activities of the Association.

Annual sessions of the Missouri General Assembly, now being held, are considering a large number of legislative bills each year affecting medicine. A great deal of time is spent by members of your staff in following these bills, in scheduling physicians to appear before committees of the Legislature and in educational activities relating to these bills.

The new office of your Association to be located at 113 Madison Street in Jefferson City is one and one-half blocks from the State Capitol Building, and there is evident advantage here. More details concerning the new office are contained in the minutes of the Council Meetings in which the Building Committee has reported. Hopes are to move into the new office in late spring or early summer.

The Caribbean Cruise for members of MSMA on Nov. 11-18, 1972, must be rated a success. Many complimentary letters from physicians who took the tour have been received in the office. You have already received an invitation by mail to participate in another MSMA-sponsored tour in July, 1973 and properly termed "Your Scandinavian Adventure." Contact our Association Office for additional information at any time.

The Public Affairs Conference held on Feb. 3-4, 1973 at the Ramada Inn, Jefferson City, produced a total attendance of some 125 people. The MSMA Woman's Auxiliary Board Meeting was held in conjunction with the Conference and their participation was most appreciated and helpful. The programs of these Annual Conferences are carefully selected by the MSMA Public Affairs Commission and have much to offer every member of the State Medical Association. There must be a way to increase the attendance of these conferences. We are earnestly looking for it.

A constant effort is made by staff to assist physicians who contact the Association Office to find a satisfactory practice location. Our efforts also are directed toward assisting communities in securing needed physicians as well as established physicians seeking associates.

Other activities of the staff are associated with projects and programs of various Association Commissions and Committees which are reported through written reports in your Delegates Handbook and have been presented in Missouri Medicine.

On June 1, 1972, Mr. C. C. (Cork) Swarens of Jefferson City joined our staff as Public Relations Director. We are most pleased to have him on our team.

Mrs. Bertha Thomas, who many of you have known for years, will retire as of April 1, 1973. She has been with the Association since *May, 1943*. Bert deserves the sincere appreciation of every member of this Association for the many years of devoted service she has given to organized medicine. I am confident that she has the very best wishes for the future from all of us.

I would be amiss if I did not use this opportunity to express my sincere appreciation and thanks to all of your State Association Headquarters employees for their cooperation and diligent service.

Raymond McIntyre, Executive Secretary

(Referred to the Reference Committee on Reports of Officers.)

Reports of Standing Committees

REPORT OF THE COMMITTEE ON CONSTITUTION AND BYLAWS

The first item discussed was the constitutional amendment concerning referendums amending Article IX of the MSMA Constitution. The amendment accepted by the House of Delegates at the 1972 Annual Session provides:

> "Petitions signed by 10% of the active members of the Association, including petitioners representing at least one half of the component medical societies, will initiate a referendum regarding changes in the Constitution or Bylaws or questions before the House of Delegates or Council. A majority vote of all active members of the Association responding shall determine the question."

It was the consensus of the Committee that this provision as accepted gives rights to the minority of the members, but does not protect the majority. Under the present Constitution, the House of Delegates may amend any Article of the Constitution or Chapter of the Bylaws by a two-thirds vote of those present and voting. Under the proposed change a simple majority of those voting could determine the question. Several states, including Illinois, have adopted a requirement of a two-thirds majority on all questions submitted under a referendum.

The Committee recommends to the Council and the House of Delegates that the Constitutional amendment accepted by the House during the 1972 session *not be adopted*. It further recommends the acceptance of the Reference Committee recommendation:

> "Petitions signed by 10% of the active members of the Association, including petitioners representing at least one half of the component medical societies, will initiate a referendum regarding changes in the Constitution or Bylaws or questions before the House of Delegates or Council. *A majority vote of all active members of the Association shall determine the question."*

. . . or suggests as an alternative the recommendation that *"a two-thirds vote of all active members of the Association responding shall determine the question."*

Either of the above changes would protect the rights of all members.

The next item on the agenda was the implementation of Resolution #8, "Representation for Medical Students," adopted by the House of Delegates during the 1972 Annual Session.

The Committee recommends that Article IV of the Constitution be amended by adding the following sentence thereto:

> "Included also in the House of Delegates shall be two student delegates, each from a different class, elected by the student body of each of the medical schools in the State of Missouri, who shall have the same rights and privileges as other delegates."

If this change in the Constitution is adopted, a corresponding change will be necessary in the Bylaws. The Committee recommends the following amendment to the Bylaws that would amend Chapter 111 of the Bylaws by adding the following paragraph to Section 2 and be numbered Section 2A and to read as follows:

> "Each of the medical schools in the State of Missouri shall be entitled to send each year two student delegates, each from a different class, elected by the student body of the said medical school. The names of such student delegates shall be certified by the Dean of said medical school to the Secretary of this Association thirty days before the Annual Session. Such student delegates shall have all the rights and privileges of all other delegates."

It was pointed out by the Chairman that if this Constitutional amendment could be adopted on Thursday, during the first session of the House of Delegates, the Bylaws could be brought up for adoption at the second session of the House on Friday.

Staff was directed to contact the Deans of the four medical schools and inform them of the procedures for electing student delegates and request that elections be held and the names of the student delegates be certified by the Deans.

Staff also was directed to inform the Deans that if the Constitutional amendment and the Bylaws change were not adopted the designated student delegates could still sit in the House as guests.

The Committee studied the Planning Committee report concerning Resolution #27, "Definition of Council Chairmanship" referred by the House of Delegates at the 1972 Annual Session to the Committee on Planning and the Committee on Constitution and Bylaws. The Planning Committee originally recommended to the Council that this Resolution be implemented. After study it was pointed out that the resolution would be quite difficult to fully implement. The Council re-referred this to the Planning Committee. The Planning Committee tabled this resolution and the Council adopted this report.

The Chairman also informed the Committee of the legal counsel's opinion clarifying the status of the Immediate Past-President sitting on the Council. The Planning Committee had requested this opinion. Legal Counsel informed the Planning Committee, "The Immediate Past-President is a member of the Council by virtue of the Constitution. He is not an Officer or a Councilor, but is on the Council in an advisory capacity for continuity." On motion, the Committee accepted this opinion.

REPORT OF THE COMMITTEE ON PUBLICATION

The 69th volume of Missouri Medicine was completed with the publication of the Dec., 1972 issue. During the year, 13 issues were printed and distributed. Eleven of these issues contained scientific papers, special articles, organizational reports, monthly messages from

115th House of Delegates

The first session of the House of Delegates was held in the Khorassan Room of the Chase-Park Plaza Hotel. The Delegates shown here are considering a resolution which is being read by the Speaker.

the Presidents of the Association and the Auxiliary and news and other items of interest to members of the medical profession. The July 1 issue contained the official proceedings of the 1972 (114th) Annual Session of the MSMA House of Delegates. The July 15 issue was the annual Membership Directory.

There were two special issues of the Journal. The scientific articles in the April issue were contributed by members of the faculty of the University of Missouri-Columbia School of Medicine and the articles in the December issue were contributed by members of the staff of Ellis Fischel State Cancer Hospital and Cancer Research Center.

Missouri Medicine published its first supplement to a regular issue in May, 1972. The 44-page supplement, which could be removed from the main journal, was cosponsored by the Missouri Society of Pathologists and the University of Kansas School of Medicine.

During the year, 56 scientific papers and 12 special articles were published. Most of the articles were written by Missouri authors.

The Editors wish to express appreciation to all authors who submitted scientific manuscripts and to all other individuals, institutions and organizations, including the administrations, faculties and publications departments of the University of Missouri in Columbia and Kansas City, St. Louis University, Washington University and Ellis Fischel State Cancer Hospital for their valuable contributions.

At the year's end, the Journal circulation was 4,900.

The complete financial report for the Journal is included in the financial statement for the Missouri State Medical Association for the year 1972. The report was published in the March, 1973 issue of Missouri Medicine and is included in the Delegates' Handbook.

REPORT OF THE COMMITTEE ON LEGISLATIVE AFFAIRS

There was a considerable amount of work and planning done prior to the 1973 Session. We established preliminary legislative goals during the summer of 1972. We were then able to draft legislation and obtain legislative sponsors of our program in time to enable many of them to be prefiled by Senators and Representatives during the December prefiling period.

The 1973 Session, the first session of the 77th General Assembly, has introduced approximately 70 bills that are of interest to medicine. Many of these are quite important bills and are followed closely by the Committee and the Staff. MSMA has supplied a number of witnesses, principally in support of good health legislation. Annual Sessions have precipitated almost year-round activity for the Committee and the MSMA Staff.

Once again, this Committee cannot emphasize strongly enough the absolute necessity of physicians participating at the local level not only in legislative affairs, but in primary and general elections as well. So often the members of our Committee and Staff hear from legislators that the physicians in their local area have not been in contact with them. We urge all physicians to become interested in legislative matters, to stay abreast of legislative trends and to effectively communicate on a continuing basis their opinions to their respective legislators. We also strongly urge each physician to support the candidate of his choice both financially and by active campaigning on behalf of the candidate. It is extremely important for all physicians to maintain rapport with their legislators.

We wish to express our appreciation to the Woman's Auxiliary to the MSMA for establishing a legislative chairman and more than 60 key women to maintain contact with their legislators.

(Referred to Reference Committee on Miscellaneous Affairs.)

REPORT OF THE COMMITTEE ON PLANNING

The following recommendations of the Committee have been submitted to the MSMA Council:

1. It is recommended that further information be obtained on the possibility of obtaining medical students after their first year of medical school, working as assistants in physicians' offices during the summer.
2. It is recommended that the Council study the possibility of relinquishing our tax exempt status under IRS regulations for nonprofit corporations.
3. House of Delegates Resolution #27, Subject: "Council Chairmanship," that was rereferred by the Council to the Committee for reconsideration and report before the Annual Meeting was tabled.
4. The Committee is of the opinion that strict adherence to tradition constitutes a continuing deterrent to the sustained involvement of competent and interested members of the Association. The Committee recommends to the Council that an appropriate study be made of this problem.
5. The Committee recognizes the continuing problem of communications and suggests that the Communications Committee (1) advocate the use of short, personal letters from Councilors to members of their District (2) maintain closer liaison with hospital staffs. Possibly a representative of each hospital staff could be designated to receive and disseminate communications from the Association.
6. The Committee suggests that the Health Care Foundation of Missouri study the possibility of developing a certified hospital admission program.
7. It is recommended that the Council study the feasibility of retaining competent management consultants to recommend possible income producing programs for the Association.

Reports of Commissions and Ad Hoc Committees

REPORT OF THE COMMISSION ON PUBLIC AFFAIRS

(This report includes all reports of ad hoc committees set up nder this Commission.)

Activities of the Missouri State Medical Association's Commission on Public Affairs in the past year included ontinuation of ongoing projects, study and recommendaions on matters referred from the House of Delegates nd Council and proposed study of improvement of the public image of organized medicine.

Beginning in July, the Commission, with Council approval, began a joint project with the Parent-Teachers Association, the State Department of Education, the Division of Health and the Missouri Association of Osteopathic Physicians and Surgeons for a series of workshops o be held at 19 locations in the state. An Ad Hoc Committee on Venereal Disease was named and, after meetng with the other organizations to develop a curriculum, 14 physicians were selected to represent the MSMA at various VD workshops held during March. Osteopaths manned the remaining workshops.

This project is likely to be continued for several years ince the scope has been changed from emphasis on venereal disease to the development of a comprehensive health education program for the schools of Missouri.

An Ad Hoc Committee chaired by Dr. Hubert Ritter of St. Louis arranged another thought-provoking, quesion-answering Public Affairs Conference, which was held February 3-4 in Jefferson City.

For the first time, the Conference was held in conjuncion with the Winter Board Meeting of the Woman's Auxiliary to the MSMA. This led, in large part, to a fair ncrease in attendance. Registration was up from 81 in 1972 to 125 in 1973. The issue-oriented program featured enlightening presentations on organized medicine, state and national health-related legislation, health care foundations and politics.

The Commission is currently studying methods to improve attendance at future Conferences. Some of the deas currently under study are alternating the Conference location to our urban areas, holding the Conference n October to coincide with the added attraction of either a Chief's or Cardinals' football game and changing the name from Public Affairs Conference to Leadership Conference.

Again this past year, the Commission was actively involved in development and promotion of the "Large and Small Hospital Organization of the '70s" Mini-Estes Seminar, which was held on March 1-2 in Columbia. Co-sponsoring the seminar with the MSMA were the Missouri Hospital Association, Missouri Association of Osteopathic Physicians and Surgeons, Missouri Regional Medical Program and Bi-State Regional Medical Program.

The "Mini-Estes" seminar is designed to improve communications between physicians, hospital administrators and hospital boards of trustees.

Some of the matters submitted to the Commission by the House of Delegates and Council were as follows:

Pediatric Coordination Council of Missouri—The Commission recommended support of the new Council with the addition of representatives from the Missouri Chapter of the Academy of Family Physicians and the Missouri Department of Education.

Consumer Health Information Program (CHIP)—This project of the University of Missouri Extension Division was reviewed and the Commission recommended that the MSMA Council request periodic progress information from CHIP officials.

Mobile X-Ray Units—The Commission investigated the methods and effectiveness of mobile x-ray units operating in Missouri and other states. It recommended that the MSMA Council endorse new guidelines established by the Tuberculosis Society of St. Louis and Eastern Missouri which limit mobile x-ray unit activity to high incidence areas or where the unit is requested by local health officials.

A high-priority item for the coming year will be the seeking of ways to improve the public image of organized medicine. This problem has been discussed for years, but, hopefully, positive ideas will be forthcoming.

Following this report are supplementary reports from the Commission's Ad Hoc Committee on Emergency Medical Services and Ad Hoc Committee on Environmental Health.

REPORT OF THE AD HOC COMMITTEE ON EMERGENCY MEDICAL SERVICES

The Ad Hoc Committee for Emergency Medical Services met on several occasions along with the Commission on Public Affairs.

It is the realization of all concerned that a major problem to be met in this state is a lack of money not only for Emergency Medical Service but for many other services and a lack of understanding of the need by many of the members of the Legislature.

Throughout the spring and summer, several members of the Commission served on the Ad Hoc Committee under the auspices of the Comprehensive Health Planning Agency. These meetings concluded in a program which outlined the needs and goals for a statewide Emergency

In his official report to the House of Delegates, President Walter T. Gunn discussed current problems and future goals of the MSMA and again urged all physicians to "get involved."

System. This program has been accepted by the Review Committee for CHP and by the CHP Board, but little implementation can be expected unless some funds from within or without the state can be found.

This proposed program for statewide system of Emergency Medical Services is a basis upon which we can build and a resolution from this committee will be presented to seek an Ad Hoc Committee to push this program.

REPORT OF THE AD HOC COMMITTEE ON ENVIRONMENTAL HEALTH

The efforts of physicians in Missouri on behalf of improved environmental health are of long standing; they are broad in scope; and they are continuing. The direct effects of physicians' efforts have become increasingly difficult to measure, primarily because concern for the environment has become diffused through the public-at-large and because of the growth and proliferation of relevant governmental agencies.

In the past 40 years, Missouri physicians have been prominent in successful campaigns for smoke abatement, milk inspection and fluoridation, on an *ad hoc* basis. For the past eight or ten years, the St. Louis Medical Society has had an Environmental Health Committee, and for the past four or five years, the Commission on Publi Affairs of the Missouri State Medical Association has ha a Committee on Environmental Health. These commit tees have studied environmental problems in Missou and in metropolitan St. Louis and have sought to publi cize these problems, seek solutions and support efforts t realize the solutions.

Missouri physicians are prominent members of th Governor's Task Force on Occupational Health and Safe ty. They have worked with the Missouri Conservatio Federation and the Missouri Conservation Commissio fighting to bring health to all Missourians through e largement of the conservation effort. The Missouri Stat Medical Association has passed a resolution declaring i support for conservation in the state as a direct conditio of public health.

The MSMA Committee on Environmental Health h cooperated with hospitals, physicians and public healt bodies on a city, county and state level to support e forts to control water pollution, air pollution and dispos of hospital waste products. There is a group studying l cal problems under the County Health Department.

On the local level, physicians in Missouri have bee actively involved in environmental aspects of Compr hensive Health Planning. Through the heat and fury the public outcry against lead poisoning, the state's ph sicians have worked quietly and conscientiously to ou line the medical aspects of the problem and to guide go ernment in its efforts to alleviate it. In St. Louis, phys cians cooperated with the federal Environmental Prote tion Agency in a successful effort to bring the Agency CHESS (Community Health Environmental Surveillan System) program to the metropolitan area.

The environmental movement now has full time, pr fessional leadership in and out of government. We ha found that the role of physicians is limited to direct a tion for limited goals, along with cooperation in broa based efforts to work toward solution of the major pro lems. We in Missouri do not, and should not, feel unco fortable in this role. On the other hand, anything le than continuing dedication by physicians to improveme of environmental health, by whatever means, is u worthy of the medical profession. While the publici and the glamor seem likely to go elsewhere, the phys cian still finds his special knowledge and concern, whi not always avidly sought, nevertheless necessary to t effort to clean up the environment.

As the environmental movement has grown, it has ta en on all the difficulties associated with size—poor co munications, an inflexible bureaucracy, confusion, jea ousy. Nevertheless, we feel that we are making progre and that we will continue to progress.

Arthur W. Neilson, Chairman

(Referred to Reference Committee on Miscellaneo Affairs.)

REPORT OF THE COMMISSION ON MEDICAL ECONOMICS, THIRD PARTY MEDICINE AND GOVERNMENTAL RELATIONS

(This report includes all reports of ad hoc committees set under this Commission.)

Our Commission held two meetings during the pa year. Most of the work of the Commission is divid among four ad hoc committees to study respective are of concern. Reports of three of these ad hoc committe follow the Commission report.

We recommended to the Council after our June me

g that close liaison be maintained with the Division of
Velfare concerning the federal management audit of pa-
ents in professional nursing homes. Mr. Proctor Carter,
ho was then Director of the Division of Welfare, pre-
nted excerpts from a management audit recently com-
leted by the federal auditors. These lay auditors exam-
ed records, discussed cases with nurses and observed
18 patients in ten nursing homes. In their opinion, 67%
f these patients may not have needed skilled nursing
are. Based on these cases, they projected that approxi-
ately $4 million should not have been paid to profes-
ional nursing homes. This appears to be an encroach-
ent by federal auditors into the fields of medical judg-
ent and evaluation. It was noted that 18 of the patients
bserved have died since the audit.

Our Commission recommended that Phase 2 informa-
on concerning physicians' fee screens under Medicare
e published in MISSOURI MEDICINE.

Our Commission recommended to the Council that the
election of alternative methods of collecting charges
rom the Medicare patient is the responsibility of the
reating physician and that the patient should not have
he option of demanding direct payment to himself for
physician's services. It recommended that the entire
roblem of third party payments going to patients in-
tead of providers needed to be studied and an ad hoc
ommittee chaired by Dr. Max Heeb of Sikeston was ap-
ointed to study and report its recommendations to the
Commission. The Third Party Payments Report follows.

The Commission recommended that the Council study
he possibility of making the brochure, "Medicare Mis-
onceptions," prepared by the Illinois State Medical So-
iety, available to MSMA members.

Two meetings have been held with officials of Aetna
oncerning the claims practices of the Aetna Life and
Casualty Company. We also have reviewed the AMA
Council on Medical Services report concerning the efforts
f the Council to correct the objectionable practices
hrough continuing discussions with Aetna representa-
ives and their listed changes in procedures which Aetna
ad committed the company to effect in order to resolve
lifferences with the medical profession. In the January
ssue of MISSOURI MEDICINE, members were requested
o comment on unsatisfactory claims practices of any
ommercial carrier. Only one claim was forwarded to the
Commission and Aetna was not involved. The Commis-
ion suggests that in the future to prevent occurrences
uch as we have had in the past two years, that contin-
ed communications with commercial carriers be held to
revent and/or alleviate these problems.

Dr. Heeb's ad hoc committee developed the following
esolution that was unanimously adopted by the Com-
nission:

WHEREAS, There are two alternatives by which a physician ren-
lering service to a Medicare beneficiary may secure compensation,
1. Taking an assignment
2. By non-assignment and billing the patient directly.
WHEREAS, By non-assignment method the physician must issue
a sufficiently itemized receipted bill if the patient has paid his bill.
Or, issue a sufficiently itemized non-receipted statement by
which the patient may then be paid directly by the Medicare car-
rier.
WHEREAS, It is not uncommon for some Medicare recipients
who receive itemized non-receipted bills to collect from the Medi-
care carrier and fail to meet their financial obligation to the phy-
sician,
Be It Resolved, That it is the physician's option to use either al-
ternative he chooses in keeping with his judgment of the patient's
needs and the intent of the patient in meeting his obligations to the
physician.

We have discussed at length the report of the Ad Hoc Committee on the Negotiation of Professional Fees and the Constitution and Bylaws for an organization that could represent the physicians in their dealings with employers, third party carriers and fiscal intermediaries.

Our Commission recommends that the MSMA Council and the MSMA House of Delegates approve an organization formed as outlined under the Ad Hoc Committee report that follows which includes the proposed Constitution and Bylaws.

REPORT OF THE AD HOC BLUE SHIELD COMMITTEE

The Ad Hoc Blue Shield Committee reports that:

1. A pernicious effort to place Blue Shield under the control of the State Insurance Department is currently pending in the State Legislature. This would severely limit Blue Shield's flexibility in offering new programs, would cause an automatic fee increase to subscribers and is grossly discriminatory in that similar health expense coverage plans sponsored by labor unions would not be regulated.
2. An open panel plan to cover all medical expenses (with a slight deduction for office calls) will shortly be offered to the public by Missouri Medical Service.
3. Missouri Medical Service (St. Louis Blue Shield) now has a plan for mail election of outstate representatives to the Voting Board, as suggested by the State Medical Association.
4. Missouri Medical Service has changed its bylaws to allow osteopathic membership on the Voting Board and Board of Trustees, as recommended by the Missouri State Medical Association.
5. Physicians treating transient patients who are members of other Blue Shield plans are urged to bill those plans directly, to avoid the situation which has arisen when out of state patients have collected from their Blue Shield plans for Missouri physicians' services, and not reimbursed the Missouri physician.

CHARLES W. CHASTAIN, Chairman
FRANCIS M. MAPLE
HERBERT C. WIEGAND
BLAINE Z. HIBBARD
ROY W. PEARSE
E. E. WADLOW

REPORT OF AD HOC COMMITTEE ON THIRD PARTY PAYMENTS TO PATIENTS

It was stated during our Committee meeting that it would be most helpful to insurance carriers in more properly honoring claims if physicians would be more specific in description of primary disease and/or injuries and complications, especially in the description of fractures. Lack of promptness on the part of the physician frequently delays processing and frequently increases the cost of processing because of needed special contacts in certain cases.

Workshops for administrators and medical secretaries held throughout the state are sponsored by the Missouri State Medical Association, the Missouri Hospital Association and by the Health Insurance Council. Representatives of carriers also are willing to be present at monthly medical secretary meetings to present educational programs on request.

Aetna's meeting with AMA officials concerning Aetna's communication to patients that under certain conditions arising out of a discrepancy between physicians' fees and Aetna's prevailing fee schedule, legal defense services would be offered was discussed at length. The present letter now in its fourth revision does not offer legal defense except under conditions of certain union-negotiated, nationwide contracts.

Medicare fee variancy problems for the same procedure, same fee charged, same diagnosis with different payments was admittedly an error by the Medicare carrier and can be appealed by requesting reconsideration for a new determination. If a new determination is not given, the physician may request an appeal for a fair hearing. If it is a non-assigned case, the patient may initiate the appeal. It has never been done, but it is permissible for a medical society to group individual appeals and request reconsideration. The physicians on our Committee urge insurance carriers to use standard HIC forms for claims at no charge and to charge the carrier $5 for any special forms. This recommendation does not appear to be in conflict with Section 7, Opinion 6 of the AMA Judicial Council.

The HIC form should be revised to include a provision for designating disability. It was also recommended that carriers adopt the AMA-CPT Third Edition Code and design a simplified one-sided form that will enable physicians to retain a copy for their files and provide a blank for the physician's name and ID number.

The Medicare billing situation in the Fifth Councilor District was studied and discussed at great length and a resolution was submitted to the Commission on Medical Economics to be included in their report to the Council concerning the several alternatives by which a physician rendering service to a Medicare beneficiary may secure compensation.

Max A. Heeb, Chairman
Rae W. Froelich
Donald H. Beisner

REPORT OF THE AD HOC COMMITTEE FOR THE NEGOTIATION OF PROFESSIONAL FEES

(Jan. 17, 1973)

The Greene County Medical Society, prior to the state meeting of the Missouri State Medical Association in 1970, passed a resolution resolving that the Missouri State Medical Association be directed to set up the mechanism for the negotiation of not only professional fees, but also the rules, regulations and procedures that establish the conditions under which the physicians render their services. They further resolved that the Delegates to the American Medical Association be instructed to establish a similar mechanism at the AMA level. The resolution was adopted by the House of Delegates and referred to the Council for further action.

The Council then referred the resolution to the Commission on Medical Economics, Third Party Medicin and Governmental Relations, which reviewed the situation and referred it to a special ad hoc committee for th negotiation of professional fees. Dr. Peterson was chai man of this committee and the other members were Joh T. Crowe, M.D.; Frank R. Williams, M.D.; Paul F. Ma M.D.; Miles C. Whitener, M.D.; and Elmer J. Schewe Jr., M.D. The ad hoc committee made a study and it wa decided it would be worthy of further exploration.

Thereafter, correspondence was instituted with the la department of the American Medical Association an with Mr. John Noble, the attorney for the Missouri Stat Medical Association. At this time, I appeared before th Council of Missouri State Medical Association and ind cated that we were proceeding according to its instru tions and that it would be necessary to have legal assis ance. Thereafter, the Medical Association appropriate $500 for this purpose.

Mr. Noble and I made a trip to Chicago where w visited with Mr. Bernard D. Hirsh, general counsel f the American Medical Association. At this point, it b came apparent that the AMA's policy was not to pr mote unionism, though they certainly were not antag nistic and were desirous of remaining in touch with o activities.

At the annual AMA meeting in 1970, the resolutio for negotiation of fees was referred to the Board Trustees for further study. As we proceeded with the a tivities in this field it became apparent that Mr. Nob would not have the time to devote to the project, and s after some length of time, we interested Mr. Max Lill of Springfield, Missouri, in the employment.

Our first approach was toward the establishment of mechanism within the MSMA to accomplish the desir end. We investigated other associations concerned wi the problems of doctors in this area. We undertook to e tablish communications with these groups and attend several meetings with them.

Legal counsel made an extensive brief of our legal p sition and has advised that it is not legally possible f the MSMA to be a mechanism for bargaining for fe and working conditions. Here we are talking the la guage of labor unions, and labor unions cannot be co porations, either general business corporations or not-fo profit corporations (such as MSMA). Unions must be u incorporated associations as proposed by the Constituti and Bylaws enclosed herewith.

The interest, which was only moderate when this pr ect was started some two years ago, is now at a high le el. At a national meeting which we attended (and, in dentally, became a rather vital part of), we were able identify upwards of 25,000 card-carrying union me bers. These ran all the way from a loose federation to o actual group which is affiliated with the AFL-CIO. T causes of this interest have multiplied remarkably duri the past two years. For the state of Missouri alone, would call to your attention the controversy which have with Aetna Life Insurance, the problems we ha with Medicaid, the fact that Medicare has reduced o income, the fact that the government has given the ph sicians special attention in the wages and prices laws, t planning for HMOs under the aegis of everybody fro the private insurance companies, hospitals, government agencies, themselves, and the most recent activities PSROs, which we have had to petition the governme for an advisory status.

A very important case can be made for the need f strong organization for negotiation. This can be accomplished under the document enclosed herewith. It has been recommended by the Ad Hoc Committee that this document be the basis for the mechanism for negotiation.

PROPOSED CONSTITUTION AND BYLAWS

PREAMBLE

We, the physicians of Missouri, in order to provide optimum medical care for the people of Missouri; in order to insure quality facilities for the provision of medical care; in order to enable physicians to give of themselves for the welfare of their patients; in order to insure adequate compensation for physicians commensurate with their training, skill and responsibility they bear for the life and health of their fellow human beings; do establish this Guild.

ARTICLE I

Purposes

The purposes of this Guild shall include, but not be limited to, the following:

1. To represent physicians in all socio-economic matters, negotiations and grievances with employers and third parties, the ultimate purpose being to promote better patient care and to prevent abuses and correct inequities in the delivery of medical services to the public.
2. To seek a voice equal to that of all others in all appropriate political, administrative, economic and legal aspects of health practice and care.
3. To seek to insure the maintenance of quality facilities for the provision of health care in order to enable physicians to give of themselves for the welfare of their patients.
4. To seek to insure adequate compensation and proper working conditions for physicians commensurate with their training and skill and the responsibility they bear for the life and health of their fellow human beings.
5. To assert the physicians' responsibility and right to assess and determine their individual roles in the practice of medicine as well as their collective interests in the establishment and maintenance of high standards of medical care in the community as a whole.
6. To promote the general welfare of all physicians and dentists who are members of this association toward the end that in the event of any misfortune occurring to them or in the event of their becoming aged, that they may be properly cared for and as far as is practical be maintained in the station of life to which they had become accustomed.

ARTICLE II

Name

The name of this Guild shall be: Missouri Physicians' Guild.

ARTICLE III

Structure

Section 1. **Districts**—The Guild shall be composed of no districts initially.

Mrs. Keith D. Jones of Warrensburg, President of the Woman's Auxiliary to the MSMA, reported to the House of Delegates during the first session. She cited accomplishments of the Auxiliary during 1972-1973.

Section 2. **Special Divisions**—The President may establish special divisions in this Guild. Such professional divisions may hold their own meetings. No special division may pass any rules or regulations unless the Executive Board and the general membership of the Guild specifically approve such rules or regulations. A special division may recommend rules or regulations and submit the same to the Executive Board and the general membership of the Guild for approval.

ARTICLE IV

Membership

1. Any person licensed to practice medicine or dentistry in the State of Missouri shall be eligible for membership in this Guild.
2. The fact that a person may be eligible for membership in this Guild does not mean that the Guild must admit him to membership.

ARTICLE V

Dues—Financial Obligations—Good Standing

Section 1. All dues and other financial obligations are due and payable on or before the 31st day of December of each year. Annual dues shall be prorated to the first of the month next following a new member's admission into the Guild.

All dues and other financial obligations not paid on or before the last day of the month in which the same are due shall become delinquent. Delinquent members shall not be entitled to any benefits heretofore or hereinafter referred to in the Constitution and Bylaws.

Members who fall in arrears two (2) months behind the date of payment of annual dues shall be readmitted as a member upon payment of Twelve and 50/100 ($12.50) Dollars readmission fee plus the payment of all unpaid membership dues plus any other financial obligations other than dues which he then owes the Guild.

ARTICLE VI

Guild Funds

The membership by majority vote at any regular meeting or at any special meeting called for the purpose may authorize disbursements of Guild funds for any purpose that shall directly or indirectly aid or serve the objects of this Guild.

All records pertaining to initiation fees, readmission fees, and other revenues of this Guild must be kept for a period of five (5) years.

ARTICLE VII

Guild Funds—Property Rights

Membership in this Guild shall not vest any member with any right, title or interest in or to the funds, property or other assets of this Guild, now owned and possessed, or that may hereafter be acquired, and each member hereby expressly waives any right, title or interest in or to the property of this Guild, including the funds of this Guild.

The title of all property, funds and other assets of this Guild shall at all times be vested in the Executive Board of this Guild for the joint use of the membership of this Guild, but no member shall have any severable, proprietary right, title or interest therein.

ARTICLE VIII

Revenue

The funds of this Guild shall be raised by membership dues and by such other means as the Guild may from time to time determine.

Membership dues shall include the following financial obligations due and owing by a member or applicant for membership: Initiation fees, readmission fees, annual dues and special fees including withdrawal fees and assessments.

Monies paid to the Guild by a member shall be applied to his obligations to the Guild in the following priority: 1. Assessments, 2. Initiation fees, 3. Readmission fees, 4. Withdrawal fees, 5. Annual dues.

ARTICLE IX

Initiation Fees

The initiation fees for the members of this Guild shall be set by the general membership by a majority vote and by secret ballot, in accordance with the applicable law. The initiation fees shall be voted upon only upon the affirmative recommendation of the Executive Board. No payments on account of initiation fees can be refunded.

ARTICLE X

Annual Dues

The minimum dues for the Guild shall be set by the general membership by a majority vote and by secret ballot, in accordance with the applicable law. The minimum dues shall be voted upon only upon the affirmative recommendation of the Executive Board.

Dues can be changed by a majority vote of the general membership of the Guild by secret ballot and upon the affirmative recommendation of the Executive Board.

No payment of Guild dues can be refunded.

ARTICLE XI

Withdrawals

A member to be eligible for a withdrawal card must be a member for at least one (1) year and must be
member in good standing as defined in Article V.

Members withdrawing from the Guild shall be exemp
from payment of all dues and assessments and shall for
feit the benefits of the Guild during the time they are ou
on a withdrawal card.

All withdrawal cards are good for a period of one (1
year from the date of issuance. Withdrawal cards ma
be renewed without charge upon request, either by mai
or in person.

No person shall be readmitted with the Guild if he ha
committed any offense against the working rules of thi
Guild.

If the withdrawal card is accepted, the following read
mission fees shall be paid: If the application for re
admission is made within one (1) month of the issuanc
of the withdrawal card, one twelfth ($\frac{1}{12}$) of the annua
dues; if such application is made within two (2) month
of such issuance, two twelfths ($\frac{2}{12}$) of the annual dues
if such application is made within three (3) months o
such issuance, three twelfths ($\frac{3}{12}$) of the annual dues
if the application is made within six (6) months of suc
issuance, four twelfths ($\frac{4}{12}$) of the annual dues; i
such application is made after six (6) months, a fu
year's dues shall be paid.

ARTICLE XII

Officers

The officers of this Guild shall consist of: Presiden
Vice-President, Secretary-Treasurer and nine (9) votin
members of the Executive Board elected from the mem
bership at large. No member shall be eligible for offic
in the Guild unless actively engaged in the practice
medicine or dentistry in the state of Missouri or workin
as an officer or employee of the Guild. The first officer
of this Guild shall serve until the annual election to b
held in December, 1973.

ARTICLE XIII

Duties of Officers

1. **President**—The President shall be the chief execu
tive officer of the Guild and the chairman of the Exec
tive Board and he shall preside at all meetings of th
Guild and of the Executive Board. He shall respons
ble for the overall management and conduct of the affai
of the Guild and shall be responsible for carrying out an
putting into effect all orders and resolutions of the Guil
and of the Executive Board. Unless otherwise ordere
and directed by the Executive Board, all agreements an
contracts on behalf of the Guild shall be executed by th
President or by the Vice-President in the absence of th
President.

2. **Vice-President**—The Vice-President shall assist th
President in the performance of his duties. He shall pr
side in the President's absence at meetings of the Guil
and at meetings of the Executive Board and he shall re
resent the President, when requested, at meetings or ot
er functions. He shall discharge all of the duties of th
President during the absence of the President or his i
ability to act or during a vacancy in that office. In the a
sence of both the President and Vice-President at an
meeting, then those present shall elect a temporary pr
siding officer for that meeting.

3. **Secretary-Treasurer**—The Secretary-Treasurer
the Guild shall keep the minutes and act as secretary
all meetings of the Guild and of the Executive Board. H

hall be responsible for giving all notices of meetings of he Guild and of the Executive Board. He shall be the custodian of the Guild's corporate books and corporate eal and shall affix the corporate seal of the Guild and atest to all proper papers and documents, the signing and execution of which have been properly authorized. He hall generally perform all duties incidental to the office of secretary and such other duties as may from time to ime be assigned to him by the Executive Board. He shall conduct the correspondence and keep the records of the Guild and of the Executive Board.

He shall have general supervision over the collection, custody and disbursement of the funds and assets of the Guild. He shall deposit said funds and assets or cause the same to be deposited in the name of the Guild in such bank, trust company or safe deposit company as the Executive Board may designate. He shall be responsible for all monies received by the Guild and for all payments made on its behalf and shall keep, or cause to be kept, complete and accurate accounts and records of such receipts and disbursements. Whenever required by the Executive Board, he shall render or cause to be rendered a complete financial accounting of said funds.

All checks in payment of Guild obligations shall be signed by the duly elected President and Secretary-Treasurer of the Guild and in the absence of the President by he duly elected Vice-President and Secretary-Treasurer. It is the intent of this provision that all checks must be signed by two (2) officers of the Guild. All checks and orders withdrawing funds from any bank, trust company or other financial institution, in payment of Guild obligations, in excess of Five Hundred ($500) Dollars, must be approved by the Executive Board. At the annual meeting of the Guild, the Secretary-Treasurer shall render a statement prepared by a certified public accountant, summarizing the receipts and disbursements of his office since the last statement. Said statement shall be presented to the Executive Board. He shall be prepared to submit a current Treasurer's report at all regular meetings of the Executive Board and the general meetings of the Guild.

4. **Compensation of Officers and Members of the Executive Board**—No officers of the Guild or member of the Executive Board shall receive any salary, compensation or emolument from the Guild or Executive Board, either directly or indirectly, unless authorized by the membership.

ARTICLE XIV

Term of Office, Nominations and Elections

1. **Term of Office**—The term of office shall be two (2) years and they may stand for reelection.

2. **Nominations and Elections**—Sixty (60) days before the annual meeting, a Nominating Committee of seven (7) members will be appointed by the Executive Board. This Nominating Committee will present a slate of officers to the membership by mail within a period of fourteen (14) days. Thirty (30) days before the annual meeting there will be an open hearing conducted by the Nominating Committee at which any member or members may make additional nominations. A complete list of nominations will be mailed to the general membership not less than twenty (20) days before the annual meeting.

Officers shall be elected at the annual meeting by signed ballots. Members may vote for the election of officers or may vote on a particular issue at a general membership meeting, either in person or by mail, by ballots supplied by the Secretary. Ballots received by mail shall be held by the Secretary and shall not be opened and counted until the time of the meeting. All ballots shall be held for a period of seven (7) days after the date of the meeting to permit examination and challenge by any interested member.

ARTICLE XV

Installation

Installation of officers and Executive Board members shall take place at the general membership meeting in January following the election.

ARTICLE XVI

Guild Meeting

There shall be one (1) general membership meeting each year, and such special meetings as may be called by the Executive Board. There shall be at least one (1) Executive Board meeting each month.

ARTICLE XVII

Quorum

At least twenty-five (25) members must be present to constitute a quorum of the membership in order to hold a meeting and transact business, or 50% of the membership, whichever is lesser.

ARTICLE XVIII

Executive Board

1. The Executive Board shall consist of all officers and shall have general charge and direction of the affairs, property and business of the Guild and the conduct of its affairs.

2. No actions against any employer shall be called until action sanction is secured from the Executive Board of the Guild.

3. Fifty (50%) per cent of the total membership of the Executive Board shall constitute a quorum at any meeting.

4. In the event that any office shall become vacant, a temporary officer shall be elected by the Executive Board. Said temporary officer shall serve until the next general membership meeting.

5. The Executive Board shall have the power and authority to censure, suspend or expel any member of this organization for good cause. The censuring, suspension or expulsion of any member shall require a two-thirds (⅔) vote of the full membership of the Executive Board. Prior to any such action, the accused member shall be given notice in writing of the charges that have been made against him. The accused member shall be given a reasonable opportunity to answer the charges either in person or in writing, request a hearing and present any evidence that he may wish. All hearings on charges shall be held before the Executive Board.

ARTICLE XIX

Committees

1. The President, with the consent and approval of the Executive Board, shall appoint the chairmen of such committees as may be deemed necessary. The chairmen of such committees shall be chosen from the members of the Executive Board. The chairman of each committee shall appoint the members of his committee, and no in-

James H. Sammons, M.D. of Baytown, Tex., Vice-Chairman of the American Medical Association Board of Trustees, was a special guest at the Annual Session. He was the guest speaker at the MSMA General Luncheon and at the Public Affairs Breakfast sponsored by the MSMA Woman's Auxiliary.

terested member of the Guild may be excluded from membership on any committee.

2. The President, with the consent and approval of the Executive Board, shall have power to appoint the chairmen of such ad hoc committees as shall from time to time be deemed advisable. The chairman of the ad hoc committees shall be chosen from the members of the Executive Board. Members of ad hoc committees shall be appointed by the chairman.

3. No officer or chairman of any committee of the Guild shall incur any financial obligation on behalf of the Guild, in excess of One Hundred ($100) Dollars, without first obtaining the consent and approval of the Executive Board. No officer or committee chairman of the Guild shall incur any financial obligations on behalf of the Guild, in excess of Two Thousand ($2,000) Dollars, without first obtaining the consent and approval of a simple majority of members voting at a general or special meeting called for that purpose.

ARTICLE XX

Appeals

1. A member who has been convicted of any offense and who believes his conviction was irregular or unjustified may appeal.

2. A member wishing to appeal from a decision may do so in writing, stating his grounds for such appeal, within thirty (30) days after such decision, after which time no appeal will be allowed. The written appeal is made by presenting it to the President.

3. An appeal from a decision must be taken to the next regular membership meeting of the Guild, or may be postponed until the next following membership meeting by special permission.

4. It shall require a majority vote of the members present at the regular membership meeting to annul or in any way alter the decision.

5. Subject to the provisions of applicable statutes and laws, every member or officer of this Guild against whom charges have been preferred and disciplinary action taken, or who has a grievance, claim or dispute against the Guild or any officer thereof, agrees as a condition of membership or affiliation, and the continuation of membership or affiliation, to exhaust all remedies provided for in the Constitution and Bylaws of this Guild, and further agrees not to file or prosecute any action in any court, tribunal or other agency until those remedies have been exhausted.

ARTICLE XXI

Amendments

This Constitution and Bylaws may be amended by the vote of two thirds (⅔) of the members of the Guild voting at a general or a special meeting called for that purpose. At any such meeting, a member of the Guild may vote in person or by a properly signed proxy. The text of the proposed amendment together with a proxy voting form shall be mailed to the membership at least thirty (30) days prior to the meeting for voting on the amendment.

(Referred to Reference Committee on Resolutions.)

REPORT OF THE COMMISSION ON CONTINUING EDUCATION AND HEALTH MANPOWER

(This report includes all reports of ad hoc committees set up under this Commission.)

The Commission on Continuing Education and Health Manpower appointed three Ad Hoc Committees, as follows: Ad Hoc Committee on Continuing Medical Education; Ad Hoc Committee on Health Manpower; and Ad Hoc Committee—115th Annual Session. The Ad Hoc Committees implemented directives of the MSMA Council and worked closely with allied health services in the study and solution of problems referred. Specific details of each Committee can be found in the individual Ad Hoc Committee Annual Reports published herein.

This year, because of pressure of time to expedite study and answers to meet deadlines, the Commission as a whole or the Chairman, directed MSMA staff to study and research certain projects. Such included (1) approval for joint sponsorship of Hospital Trustees, Administrators and Physicians Institutes to explain the revised Accreditation Standards of the Joint Commission on Accreditation of Hospitals, May 11-13, 1973 (to include Quality Assurance Program for Medical Care in the Hospital, American Hospital Association) and (2) study of comparison with other states of reciprocity licensure.

REPORT OF THE AD HOC COMMITTEE ON CONTINUING MEDICAL EDUCATION

The Ad Hoc Committee on Continuing Medical Education met three times in 1972. There was an orientation of the Councilor District representatives at the first meeting. Discussions were held concerning the advisability of voluntary versus compulsory systems of CME in Missouri. It was reaffirmed that a voluntary system should be developed.

At its second session, the Ad Hoc Committee and district representatives invited three experts from other states to discuss the role of the State Medical Society in CME. The session was enlightening and stimulating.

A severe ice storm interfered with the third meeting, but several topics referred to the Ad Hoc Committee were discussed and reported to the Council.

The MECO program, in cooperation with the SAMA, has been generally successful. Evaluations have been received from both the community hospitals and the students. These evaluations clearly justify continued support of the program.

The Chairman now feels that the Ad Hoc Committee and the district representatives are in a position to develop a specific plan for CME of members of the Society. It is anticipated that in 1973, it will be ready for presentation to the Council.

REPORT OF THE AD HOC COMMITTEE ON HEALTH MANPOWER

The Ad Hoc Committee on Health Manpower met in Columbia, held a telephone conference and finalized discussions of the year by letter communication. These were presented to the Missouri State Medical Association Council, approved and received final approval of Missouri State Medical Association at its annual meeting establishing guidelines for the nurse administration of intravenous fluids, medications and blood. Unresolved is the use of intubation, intracardiac injections and defibrillation. However, results of consultation with the involved specialties are available for committee evaluation and recommendation.

The committee was presented the program of and support the Community Based Educational Manpower project in Rural Mid-Missouri.

The committee was represented at Itasca, Ill. on November 9 and 10 at the conference of State Joint Practice Committee sponsored by AMA's National Commission for the study of nursing and nursing education with the findings that many of the presented problems are already under discussion by your committee.

The committee was represented in Jefferson City at the statewide conference of nursing and nursing education on September 19 and 20.

We thank you for your confidence and support.

REPORT OF THE AD HOC COMMITTEE 115th ANNUAL SESSION

For the second year in succession, the Committee invited the respective medical specialties to sponsor and develop Scientific Sessions of their own choosing to be included in the MSMA 115th Annual Session on March 29-April 1, 1973 in St. Louis. The Committee is pleased to report the response was very gratifying. A total of twenty-five 90-minute sessions were developed and will be presented, including two General Sessions and two programs presented by voluntary agencies.

The Program Committee invited the medical specialties to also schedule their business and social functions during the MSMA Annual Session. Again, the response was good.

The Committee revised the Scientific Session format as described above, in an effort to promote greater interest and attendance at Scientific Sessions.

The Committee would like to express appreciation to the official representatives serving on the MSMA Commission on Interspecialty Medicine for their cooperation and interest.

REPORT OF THE COMMISSION ON MEDICAL-LEGAL AFFAIRS

Our Commission held three meetings conjointly with the medical-legal committees of the Missouri Association of Osteopathic Physicians & Surgeons and the Missouri Bar Association.

All three parent organizations approved and adopted

(Left to right) Dr. Hubert A. Ritter, St. Louis, and Dr. James H. Sammons are interviewed by Reed Powell on his "morning Affair" TV program which is telecast live from the lobby of the Chase Hotel. Dr. Sammons is Vice-Chairman of the AMA Board of Trustees.

the "National Interprofessional Code for Physicians and Attorneys." This Code sets forth suggested rules of conduct between the two professions. Copies of this Code have been distributed to all members of MSMA and, also, to senior medical students.

The Associations represented also obtained permission from their parent organizations to receive and attempt to resolve complaints arising between physicians and attorneys in their inter-related practice that cannot be resolved at the local level. During 1972, several complaints were handled by our Committee.

We have discussed the preliminary report recently issued by the United States Malpractice Commission. Their main specific recommendations included (1) States should drive the "bad apples" out of medical practice by putting sharper teeth into their licensing laws; (2) States should set up machinery for compulsory but nonbinding arbitration of some malpractice claims; (3) The courts in the states should require a sliding scale contingent fee for malpractice cases; (4) Private interests should draw standby plans for insuring physicians in any area where malpractice coverage becomes unavailable; (5) A broad-base group, not otherwise specified should look into *res ipsa loquitur* and other prickly medical-legal doctrines; (6) A major effort should be made to collect data that might contribute to a better understanding of the medical malpractice process; (7) Health care institutions should intensify their efforts to prevent all types of medical injuries, whether due to negligence or not; (8) Each hospital and other health care institutions should establish a grievance mechanism for dealing meaningfully with patient complaints; (9) Each state should establish a cabinet level office of consumer medical affairs. Most of our members expressed their disappointment in the conclusions of the report. This Commission met for a year and a half and spent $2 million and their main conclusion seems to be that a broad-based group should study the problem. This was the original charge to this Commission.

Our Commission has discussed and studied at great length the use of video tape depositions. Under present Missouri court rules, video tape depositions are considered inadmissible except by agreement between the attorney representing the plaintiff and the attorney representing the defendant. They must agree beforehand to permit the use of video tape depositions in lieu of written depositions. Missouri statutes and Supreme Court rules clearly state that depositions must be reduced to writing. Under Federal Court rules, video tape depositions are now permitted in Federal Courts.

The following arguments were presented for the use of taped depositions:

1. The great convenience to the witnesses especially physicians. 2. These can eliminate prejudicial statements. Improper remarks that could result in a mistrial or a new trial can be removed before the tape is rerun in court. 3. It would allow the judge to reconsider rulings. He would have time to think over objections, and it would give him a second chance to rule. 4. They could prevent continuances of trials due to the absence of witnesses. Attorneys could go ahead and take the video tape testimony. It is always believed that video tape testimony could be obtained more cheaply than written and transcribed depositions. 5. It would insure against loss of testimony. Under the present system, witnesses may be dead or out of state or unavailable when the case is finally tried. Also, expert out-of-state witnesses are presently quite expensive. It is necessary to bring the man to trial and have him wait to give his testimony. If video tape depositions would be allowed, the attorney could go out of state and take the deposition. 6. The present system of written depositions is quite time consuming. It is believed that video tape depositions would allow attorneys more time to prepare for the case. 7. All of the facts and testimony could be recorded when it is still current and fresh in the mind of witnesses. 8. It could prevent the present "circus" atmosphere of courtroom trials. 9. It would help shy or nervous witnesses in presenting their testimony. 10. It could create a layer of "super specialists." Special super lawyers could take video tape depositions from nationally known super specialist witnesses. 11. It could possibly help produce settlements. Both sides would now know the witnesses' remarks before the trial and there would be no gamble on the testimony.

There are few disadvantages as compared to the present system. Some of the disadvantages are:

1. On medical testimomy, a physician testifying in court could help fill in some of the gaps for the jury. 2. While this system may save time for the attorneys, it makes much more work for the judge, court and the jury. 3. The handling of exhibits, especially x-rays, would be more difficult with the use of video tape depositions. 4. Lawyers would need to spend more time developing and proving the credibility of witnesses. With court appearances, the jury can see them and they have more of a person-to-person relationship. It would take a TV personality to come across on a video tape screen. 5. It would be quite difficult to prepare for cross-examination. 6. Trial by screen would be a much duller experience. Verdicts would probably tend to be more in the middle.

Our conjoint Committee has recommended that the question of the usage of video tape depositions be brought to the Missouri Bar Rules Committee and that possibly Missouri Court rules could be changed to allow the use of video tape depositions.

We have recommended that the joint meetings be continued as we believe they are of great assistance to both professions.

REPORT OF THE COMMISSION ON INTERSPECIALTY MEDICINE

(This includes all reports of ad hoc committees set up under this Commission.)

The Interspecialty Medicine Commission has had nothing referred to it for action and, therefore, has had no meeting during the past year and has no report to make at this time.

The medical specialties represented on the Commission, however, were invited by the Convention Planning Committee to sponsor Scientific Sessions during the 115th Annual Session on March 29-April 1, 1973. Medical specialties sponsoring one or more sessions included the Missouri State Allergy Association; Missouri Society of Internal Medicine; Missouri Chapter, American Academy of Pediatrics; Missouri Psychiatric Association and Missouri Academy of Psychiatry; Missouri State Surgical Society; Missouri Society of Anesthesiologists; Missouri Ophthalmological Society, Inc.; Missouri Radiological Society; and Missouri Dermatological Society, Inc.

The Ad Hoc Committee for Health Care of the Poor was organized from representatives on the Interspecialty Commission. See report below.

THE COUNCIL

The Speaker stated that the portions of the reports of Council Meetings which are referred to Reference Committees are preceded by a black square (■) and are concluded with the committee assignment, which is set in bold face type.

Meeting of April 9, 1972

■ Walter T. Gunn, M.D., St. Louis, President, called the meeting to order. Those present were Drs. Gunn; Gerald L. Miller, Kansas City; E. A. Stricker, St. James; John I. Matthews, Jefferson City; Charles R. Gulick, St. Louis; John N. Martin, St. Joseph; Lysle M. Bach, Hannibal; Max S. Franklin, St. Louis; Louis P. Hetlage, Troy; James C. Cope, Columbia; William D. Bradshaw, Clinton; R. Allen Chandler, Kansas City; Howard J. McAlhany, Springfield; Claude W. Cooper, Thayer; Eugene T. Hansbrough, Poplar Bluff; Joseph V. Finnegan, St. Louis; Robert Felix, St. Louis; William D. Mayer and William C. Allen, Columbia; Mrs. Keith D. Jones, Warrensburg; Messrs. Allen D. Smith, Kansas City; Hollister S. Smith, St. Louis; Gary L. Schnedler, Springfield; Edward Hirsch, St. Joseph; John Noble, Kennett; Ray McIntyre, Bob Carroll, Royal O. Cooper and Miss Jean Duensing, Staff, Jefferson City.

Dr. Gunn opened the meeting and asked Dr. Stricker to introduce the new Councilor. Dr. Stricker introduced Dr. Claude W. Cooper, Thayer, as the new Councilor from District 9.

Dr. James C. Cope was nominated and elected Chairman of the Council by unanimous vote and, thereby, became the presiding officer.

Dr. R. Allen Chandler was nominated and unanimously elected Vice-Chairman of the Council. Dr. Charles R. Gulick was nominated and unanimously elected Treasurer, and Dr. John I. Matthews was nominated and elected Secretary by acclamation.

The next meeting of the Council will be held on June 3-4, 1972, at the Ramada Inn, Jefferson City.

PUBLICATION COMMITTEE REPORT

Dr. Joseph V. Finnegan, Editor of the MSMA Journal, MISSOURI MEDICINE, recommended to the Council that the present Publication Committee consisting of Drs. Finnegan, William C. Mixson, Charles S. Sherwin, Byron M. Stuart and Wilfred Wooldridge be reappointed. On motion, duly seconded, the Council agreed that the above members be reappointed to the Publication Committee for a one-year term.

After a brief discussion regarding appointments to the MISSOURI MEDICINE Editorial Board, it was moved and seconded that this matter be tabled until the next Council meeting.

FINANCE COMMITTEE REPORT

Dr. Cope then made the following appointments to the Finance Committee: Drs. Gulick, Gunn, Miller, McAlhany and Cope. He indicated that he would make his appointments to the Communications Committee at the next Council Meeting.

Dr. Cope stated that Blue Shield has compiled a notebook that will be sent to the physicians explaining the various Blue Shield plans and indicating the benefits of each plan. He said that he felt this will be very worthwhile.

The Chairman made the following appointments of Councilor Advisors to the standing Commissions of the MSMA for the year 1972-1973:

Commission on Public Affairs	William D. Bradshaw, M.D.
Commission on Continuing Education and Health Manpower	E. T. Hansbrough, M.D.
Commission on Medical Economics, Third Party Medicine and Governmental Relations	Louis P. Hetlage, M.D.
Commission on Medical-Legal Affairs	Howard J. McAlhany, M.D.

—Referred to Reports of Officers Committee.

HEALTH CARE FOUNDATION

■ Dr. Bradshaw indicated that the MSMA House of Delegates had passed a resolution stating that a current copy of the Constitution and Bylaws of the Health Care Foundation of Missouri, Inc. be sent to all members of the Missouri State Medical Association and that this mailing be undertaken at the direction of the Council of MSMA.

Discussion followed regarding how this mailing might be accomplished. Dr. Miller stated that the Board of HCFM has discussed the possibility of such a mailing, but no definite decision had been made. It was stated that, perhaps, MSMA should await action of the Board of HCFM on this.

After further discussion, Dr. Hansbrough moved that the Health Care Foundation be asked to initiate preparations for mailing a copy of the Constitution and Bylaws of HCF to all members of MSMA with our assistance. Motion was seconded and carried. It was then moved and seconded that the suggestion be made to the Foundation that their Constitution and Bylaws might be published in the July 15, Directory Issue of Missouri Medicine. Motion carried.

The Chairman asked that all motions be written and presented to the Secretary so that they may be recorded properly.

COMPREHENSIVE HEALTH PLANNING

Dr. Hetlage reported that there is a study of emergency medical care facilities now being undertaken in Missouri by a task force of the State Comprehensive Health Planning Agency. He made the following motion concerning this matter: That the Council of MSMA encourage the project undertaken by the State Sub-Task Force on Comprehensive Emergency Services of the Comprehensive Health Planning Agency as recommended by the MSMA Ad Hoc Committee on Emergency Services and that a letter be sent to the Governor and the Chairman of the Commission offering assistance and cooperation of the MSMA in the development of this project. Motion was seconded by Dr. Martin.

Dr. Hetlage stated that this project would be funded with money from HEW. The Illinois Plan was discussed. It was pointed out that there were some problems with that particular plan, but it was felt that the Ad Hoc Committee would recommend a more feasible plan. Dr. Hetlage pointed out that he was not seeking approval of a specific plan, but asking only that the Council encourage this and offer our assistance and cooperation in its development. After further discussion, the above motion made by Dr. Hetlage and duly seconded was accepted by the Council.

Dr. Miller thanked the Council for its support during his year as President of the Association and offered his support and cooperation to the Chairman of the Council for the coming year.

The meeting adjourned at 10 AM and was followed by a short Executive Session to discuss the administrative set-up in the MSMA Office.—**Referred to Resolutions Committee.**

Meeting of June 3-4, 1972

■ James C. Cope, M.D., Columbia, Chairman, called the meeting to order. Those present were Drs. Cope; Walter T. Gunn, St. Louis; E. A. Stricker, St. James; John I. Matthews, Jefferson City; Gerald L. Miller, Kansas City; John N. Martin, St. Louis; Lysle M. Bach, Hannibal; Max S. Franklin, St. Louis; Louis P. Hetlage, Troy; William D. Bradshaw, Clinton; R. Allen Chandler, Kansas City; Howard J. McAlhany, Springfield; Claude W. Cooper, Thayer; Eugene T. Hansbrough, Poplar Bluff; Joseph V. Finnegan, St. Louis; Stanley S. Peterson, Springfield; Arthur W. Neilson, St. Louis; J. Loren Washburn, Versailles; Hector W. Benoit, Jr., Kansas City; William D. Mayer and William C. Allen, Columbia; R. K. Noback, Kansas City; George Thoma, St. Louis; Blaine Z. Hibbard, Kansas City; Paul R. Young, Columbia; Herbert R. Domke, Jefferson City; John S. Spratt and James N. Hueser, Columbia; Mrs. Keith D. Jones, Warrensburg and Mrs. Gerald L. Miller, Kansas City, Woman's Auxiliary; Messrs. John W. Noble, Kennett; Allen D. Smith, Kansas City; Hollister S. Smith, St. Louis; Ray McIntyre, Tom P. Fox, Royal O. Cooper and C. C. Swarens, Jefferson City, Staff.

Chairman Cope called the meeting to order at 9:05 AM and requested approval of the minutes of meetings on April 5 and April 9, 1972. On motion of Dr. Gunn, duly seconded, the minutes were approved as distributed.

Dr. Cope read a letter from a MSMA member requesting use of the addressograph plates for a statewide mailing. He stated that he had answered this letter, indicating MSMA policy regarding use of these plates but stating that if the writer so desired, it would be brought up at this Council meeting. No further request was received. Dr. Hansbrough stated that he felt that when such a request is received from an MSMA member, it should be considered.

REPORT OF THE EXECUTIVE SECRETARY

Mr. McIntyre introduced Mr. C. C. Swarens, new Public Relations Director for the Missouri State Medical Association, who joined the MSMA Staff on June 1.

Mr. McIntyre reported that a letter expressing deep regret at the death of Mr. Edgar Mothershead, former Executive Secretary of St. Louis County Medical Society, was sent to Mrs. Mothershead and had been acknowledged. Thanks also were received for the flowers sent by the Council and Officers to the funeral of Dr. Wendell Scott of St. Louis.

Mr. McIntyre reported that M.D. Day at the University of Missouri will be held on November 17-18. The Missouri Tigers will play Iowa State.

He said that a resolution received from the California Medical Association indicated that the California Medical Association has informed the Regional Medical Program of California that it will not support the funding for financing of HMOs from RMP funds.

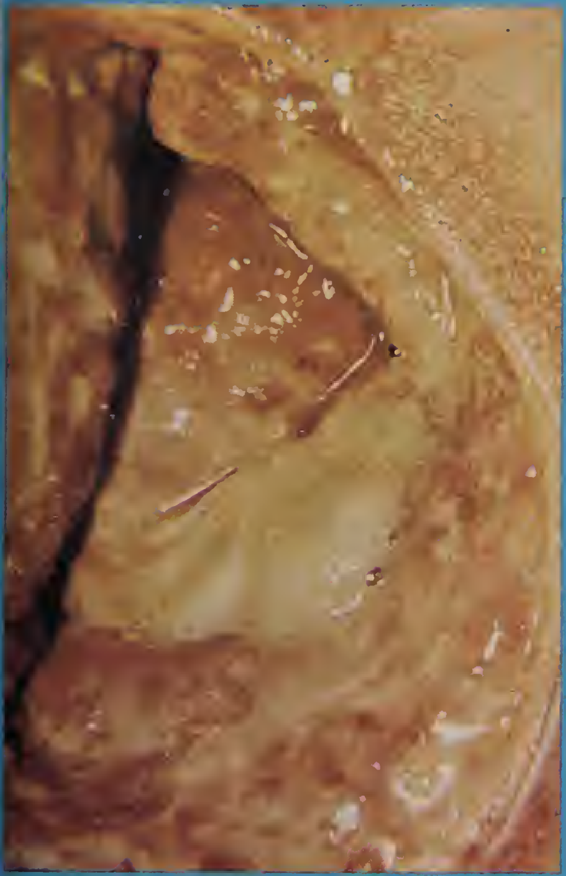
He stated that total registration at the 1972 MSMA Annual Session was 955 with 605 physicians. Dr. Richard E. Palmer, Trustee of the AMA, who attended the Annual Session, called the office after the meeting and indicated that he felt the scientific sessions were very good. The sessions were well attended.—**Referred to Reports of Officers Committee.**

■ Mr. McIntyre reported an evaluation of the conference on "Large and Small Hospital Organization for the 70s." The overall attendance was 300. During the meeting, a questionnaire regarding the content of the conference was circulated. These reports were favorable. On the basis of this and the financial outcome, it is recommended and planned for a similar conference to be held next year on March 1-2, 1973. The Joint Commission on Accreditation is trying to set up workshops for the same people (hospital administrators, chiefs of staffs, board members, etc.). There is the question as to how many meetings can be held in a short period of time for the

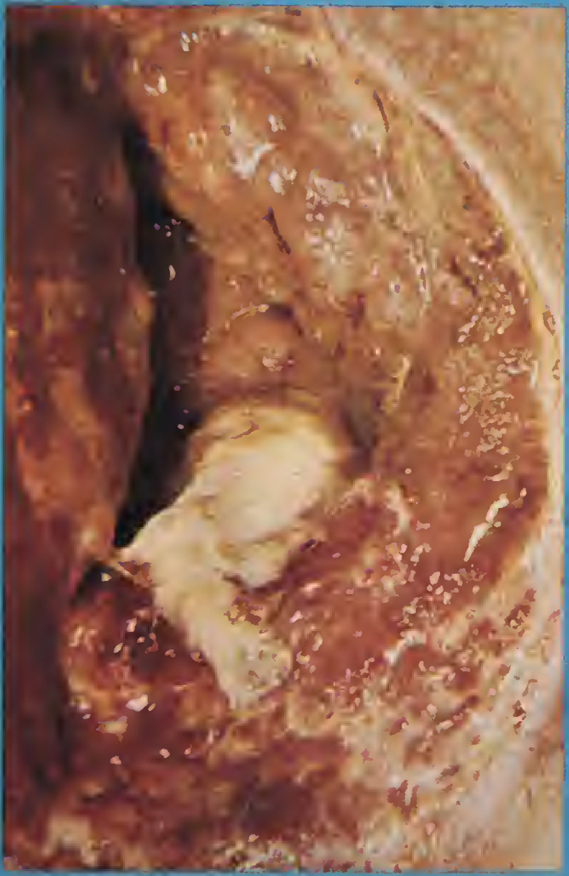
Decubitus Ulcers Yield to

Travase® Ointment

brand of **Sutilains**



Before treatment, necrotic matter coated the inner surfaces of this decubitus ulcer.



After six days of TRAVASE therapy, debridement is nearly complete and granulation evident.

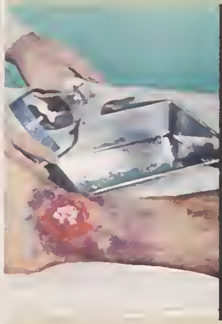
Travase® Ointment brand of Sutilains

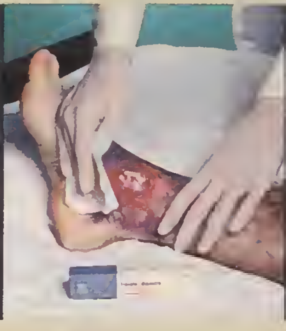
PPLICATION TECHNIQUE: TRAVASE Ointment is indicated as an adjunct o established methods of wound care for biochemical debridement. It dissolves and facilitates the removal of necrotic tissues and purulent xudates.

RAVASE enzymes are selective. Virtually inactive on viable tissue.

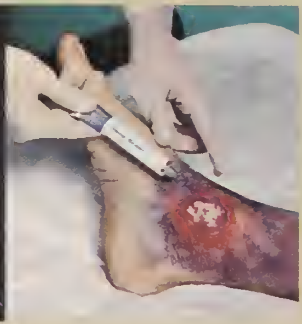
Vhen this recommended nursing technique is followed without deviation, his procedure can generate visible improvement within 48 hours . . .



cer being irrigated) roughly cleanse and gate the wound area using y sterile water or sodium oride solution. Be sure to anse the wound of any iseptics or heavy-metal ibacterial agents which y interfere with the yme activity.

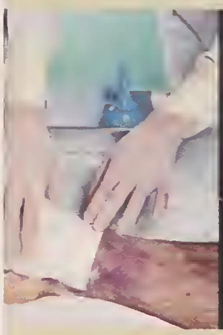


Thoroughly soak the wound area. Where practical, tubbing or showering is suitable. Or wet soaks with gauze pads may be used. Remember to avoid chemical cleansing agents which may interfere with the therapy.

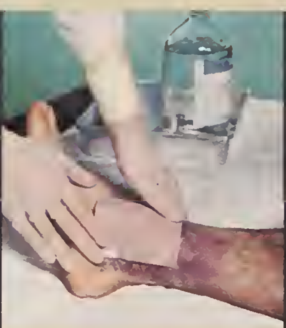


With a sterile cotton swab or finger cot, apply a very thin layer of TRAVASE Ointment. The ointment spreads easily and only a small amount is needed (a small dab of ointment will cover an area as big as the back of a hand).

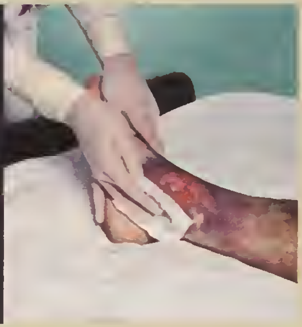
Be sure, though, to rub the ointment well into every crack or crevice of the wound and overlap the surrounding skin one-fourth to one-half inch beyond the area to be debrided—to be sure of complete coverage.



ply loose, wet dressings, roughly soaked in sodium oride solution or sterile ter to the area to be rided only.



Cover the moist dressings with an occlusive wrap (Saran wrap, Telfa Pads, or other plastic wrappings) to keep wound site moist. Do not extend occlusive wrap over ½ inch beyond area to be debrided.



When changing dressing, gently wipe away the dissolved material. Repeat the complete dressing procedure, including application of TRAVASE Ointment, four times daily.

e ulcer shown in these photos is simulated on a model in order to demonstrate e correct TRAVASE application technique.

______Additional Information on TRAVASE® Ointment (brand of Sutilains)

______In-service training program

______Comment______________________________

DESCRIPTION: TRAVASE® (brand of sutilains) Ointment is a s preparation of proteolytic enzymes, elaborated by **Bacillus sub** hydrophobic ointment base consisting of 95% white petrolatur polyethylene. One gram of ointment contains approximately 82 units* of proteolytic activity.

ACTION: TRAVASE Ointment selectively digests necrotic soft proteolytic action. It dissolves and facilitates the removal of n tissues and purulent exudates that otherwise impair formation granulation tissue and delay wound healing (4).

At body temperatures these proteolytic enzymes have optimal the pH range from 6.0 to 6.8.

INDICATIONS: For wound debridement (1,2)—TRAVASE Ointn indicated as an adjunct to established methods of wound care biochemical debridement of the following lesions:

Second and third degree burns,
Decubitus ulcers,
Incisional, traumatic, and pyogenic wounds,
Ulcers secondary to peripheral vascular disease.

CONTRAINDICATIONS: Application of TRAVASE (brand of sut Ointment is contraindicated in the following conditions:

Wounds communicating with major body cavities,

Wounds containing exposed major nerves or nervous tiss

Fungating neoplastic ulcers,

Wounds in women of child-bearing potential—because of laboratory evidence of effects of TRAVASE upon the deve

WARNING: Do not permit TRAVASE Ointment to come into cc the eyes. In treatment of burns or lesions about the head or n the ointment inadvertently come into contact with the eyes, th be immediately rinsed with copious amounts of water, prefera

PRECAUTIONS: A moist environment is essential to optimal a enzyme. Enzyme activity may also be impaired by certain age several detergents and antiseptics (benzalkonium chloride, hexachlorophene, iodine, and nitrofurazone) may render the s indifferent to the action of the enzyme (3). Compounds such a containing metallic ions interfere directly with enzyme activity slight degree, whereas neomycin, sulfamylon-streptomycin, ar do not affect enzyme activity. In cases where adjunctive topic has been used and no dissolution of slough occurs after treat TRAVASE Ointment for 24 to 48 hours, further application, be interference by the adjunctive agents, is unlikely to be reward

In cases where there is existent or threatening invasive infect appropriate systemic antibiotic therapy should be instituted c

Although there have been no reports of systemic allergic reac humans, studies have shown that there may be an antibody re humans to absorbed enzyme material.

ADVERSE REACTIONS: Adverse reactions consist of mild, tra paresthesias, bleeding and transient dermatitis. Pain usually controlled by administration of mild analgesics. Side effects enough to warrant discontinuation of therapy occasionally ha

If bleeding or dermatitis occurs as a result of the application (brand of sutilains) Ointment, therapy should be discontinued toxicity has been observed as a result of the topical applicat TRAVASE Ointment.

Dosage and Administration

STRICT ADHERENCE TO THE FOLLOWING IS REQUIRED FC RESULTS OF TREATMENT

1. Thoroughly Cleanse and Irrigate Wound Area with sc or water solutions. Wound **MUST** be cleansed of anti heavy-metal antibacterials which may denature enzy substrate characteristics (e.g., Hexachlorophene, Sil Benzalkonium Chloride, Nitrofurazone, etc.).
2. Thoroughly moisten wound area either through tubbi or wet soaks (e.g., sodium chloride or water solutior
3. Apply TRAVASE Ointment in a thin layer assuring in with necrotic tissue and complete wound coverage e ¼ to ½ inch beyond the area to be debrided.
4. Apply loose wet dressings.
5. Repeat entire procedure 3 to 4 times per day for be

How Supplied

3P3002 TRAVASE Ointment is supplied sterile in one-half (14.2 g.) containing 82,000 casein units of sutilains hydrophobic ointment base.

The ointment must be stored under refrigeration at 2° to 10° (35° to 50° F).

ame people.—**Referred to Miscellaneous Affairs Committee.**

■ Mr. McIntyre stated that he attended a recent meeting of the Governor's Advisory Council on Comprehensive Health Planning. A number of committee meetings had been held the previous night and reports were presented to the Council. He stated that he felt it would be well for a member of our staff to attend all of these meetings. On motion of Dr. McAlhany, duly seconded, it was agreed that a staff member should attend all Advisory Council meetings.—**Referred to Resolutions Committee.**

PRESIDENT'S REMARKS

■ Dr. Gunn reported that the check which KMOX had received as part of its Journalism Award from MSMA at the 1972 Annual Session was returned to the Association to be used in any manner the Association desired. KMOX was informed that the money would be given to the Missouri State Medical Foundation in the station's name. KCMO donated its Journalism Award check to the University of Missouri-Kansas City. Dr. Gunn announced that the MSMA Honors Graduate Awards and $100 Savings Bonds were awarded this year to the following three medical school graduates: Richard Allen Landy, St. Louis University; Mrs. Charlotte DeCroes Jacobs, Washington University; and Mrs. Jean Edwards Holt, Missouri University-Columbia.

The President reported that the MSMA membership check has been sent to the Association of State Medical Association Presidents. He will attend their meeting on Saturday preceding the AMA Annual Session in San Francisco.

Dr. Gunn reported that the Missouri State Medical Foundation has received a donation of $2,402.74 from the Boone County Medical Society Polio Fund.

President Gunn said that he had sent a telegram of congratulations to Mrs. Prentiss Lee, President of the AMA Woman's Auxiliary, on the occasion of the Auxiliary's 50th Anniversary.—**Referred to Reports of Officers Committee.**

■ Dr. Gunn stated that the Health Commissioner of the City of St. Louis had made application, with the endorsement of St. Louis Medical Society, for assistance through the National Health Services Corps to provide additional physicians to serve patients utilizing Homer G. Phillips Hospital. If there were no objection from the Council, Dr. Gunn would sign the endorsement.

The Wayne Miner Health Center in Kansas City is involved in this same type of program with the approval of the Jackson County Medical Society. These physicians serve in this way in lieu of their military service. The community must demonstrate a real need and the local and state medical societies have to certify the need. These physicians received a straight salary.—**Referred to Medical Education and Public Welfare Committee.**

REPORT OF THE EXECUTIVE COMMITTEE

■ Dr. Gunn, Chairman of the MSMA Executive Committee, reported that the Committee met on May 7 and interviewed applicants for the MSMA staff position opening created by the resignation of Mr. Bob Carroll. Mr. Swarens was employed.

The Executive Committee appointed Drs. Matthews, Cope and Gulick to a Building Committee for the new home of the MSMA.

The Executive Committee also requested staff to research and make recommendations regarding staff personnel policies.

Congressman James W. Symington of Missouri *(left)* and Congressman Tim Lee Carter of Kentucky addressed members of the MSMA at the General Session in the Chase Club on March 30.

On motion of Dr. McAlhany, duly seconded, it was agreed that a Committee of the Council should work with the staff in this regard. The following Councilors were appointed to this Committee: Drs. Matthews, Stricker and Franklin.—**Referred to Reports of Officers Committee.**

REPORT OF LEGAL COUNSEL

■ The Chairman called on Mr. Noble, MSMA Legal Counsel, for a brief report regarding the two law suits in which the Association is involved. He stated that a disappointing decision had been handed down in the Curteman Case. A motion for rehearing has been filed. He stated that the decision deprives the physicians of Missouri of certain rights. Mr. Noble stated that he is hopeful that the Court will rule favorably on the motion for rehearing.

Mr. Noble reported that in connection with the Health Care Foundation suit, motions filed in the case are still pending and answers supporting these motions also have been filed with the Court.

Discussion followed regarding Legal Counsel's presentation. In regard to the Curteman Case, Mr. Noble indicated that the Missouri Supreme Court held that MSMA was not a real party in interest. It was pointed out that the decision rendered was made by a section of the Court and the MSMA has requested that it be reconsidered or that the entire Court consider it.

Dr. Hetlage asked whether or not this decision would place physicians' assistants in jeopardy. Mr. Noble indicated that he thought this might set a precedent.—**Referred to Resolutions Committee.**

REPORT OF DISTRICT COUNCILORS

■ *District #1*—Dr. Martin reported that the Northwest Missouri Medical Society recently held a meeting with Blue Shield representatives present. They discussed their new policy on payment of outpatient charges and how they will pay laboratory charges on outpatients.

Dr. Martin reported difficulties with some of the planned parenthood clinics. He stated that it seems that many girls are going into Kansas City and are getting birth control pills without any examination. He stated that the St. Joseph and Northwest Missouri clinics are not operated that way.

Dr. Martin stated that they have become involved in the MECO Program and feel that it will be a good thing for their area.

He indicated that they are having a problem with the Coroner's job, and could not find an M.D. who wanted to run for the position. However, they now have an M.D. on the ballot.

Dr. Martin expressed concern about the fact that the President of the Illinois Medical Association was in attendance at the MSMA Annual Session and seemingly was unescorted and left on his own. Dr. Cope indicated that if this were the case, he felt it was serious and every effort should be made in the future to be certain that these gentlemen are taken care of.

Mr. Martin reported that North Kansas City Hospital has received applications for staff privileges from two D.O.s. This matter is now pending before the Board.

District #2—Dr. Bach stated that he had no pertinent report at this time.

District #3—Dr. Franklin reported that the Publicity Committee for St. Louis Medical Society has completed a three-year program to indoctrinate the news media. During this period, they have had meetings and round table discussions with presidents, editors and program administrators, editorial page editors, radio announcers, etc. of various radio and TV stations and newspapers. Dr. Franklin stated that he feels their relationship with the media has improved tremendously.

Dr. Franklin reported that he had received many phone calls regarding the mailing of the Division of Health on the new controlled substances law and the requirement for registration. An article has since been published in MISSOURI MEDICINE explaining the background and purpose of this law. This explanation was developed in collaboration with the Division of Health. Dr. Domke stated that the bill in the Legislature received extensive play from the press.—**Referred to Miscellaneous Affairs Committee.**

■ Dr. Franklin indicated that Dr. Benoit went to St. Louis and discussed the Health Care Foundation. Th meeting was sparsely attended due to the number o other meetings and activities that evening.—**Referred t Resolutions Committee.**

■ *District #4*—Dr. Hetlage indicated that his Distric Report does not necessarily represent his opinions, bu those of his Councilor District. Dr. Hetlage reported tha the following action was taken by a committee compose of the majority of delgates from the Fourth Councilo District, all counties being represented, and the pres dents of the various medical societies. There was a 75 attendance at this meeting. The Committee requested th Council to ask the appropriate commission to defin areas of action for those paramedical personnel perform ing certain emergency functions normally carried out b physicians (the Chairman referred this to the Commis sion on Continuing Education and Health Manpower).

The Committee urges passage and implementation of "Good Samaritan Act" which would not only protec physicians, but paramedical personnel rendering emer gency treatment if a physician is unavailable.

Dr. Hetlage stated that a lengthy discussion was hel on compulsory postgraduate education. In summary, th Committee favors the compulsory education as an ult mate goal of the Missouri State Medical Association. was felt that the most practical solution for immediat implementation would be a yearly minimum of hou of postgraduate study as a prerequisite for continuin licensure.

The Committee did not favor examination as a mean to this end. However, it did favor self-evaluation exam inations as a means for continuing education stimulus. I was felt that there should be some reexamination withi a specialty for continued certification, but that thi should be left to the individual discretion of the specialt boards, either on a local or national level.—**Referred t Medical Education and Public Welfare Committee.**

■ Dr. Hetlage reported that a lengthy discussion wa held regarding the relevance of the MSMA and the ap parent lack of interest exhibited by the average gras

---

The Woman's Auxiliary to the MSMA held its Annual Convention in conjunction with the MSMA Annual Session on March 29-April 1.

(Left to right, first row) Mrs. Charles R. Willman, St. Joseph, and Mrs. George J. Lytton, Kansas City, were installed as MSMA Auxiliary President and President-Elect for 1973-1974; Mrs. Willman confers with Mrs. Keith D. Jones, Warrensburg, 1972-1973 Auxiliary President; Mrs. J. Loren Washburn, Versailles, Doctors' Day Chairman, with special posters she prepared for the meeting.

(Second row) Mrs. James A. Reid of Marshall, Chairman, presents a membership pin to Mrs. Raymond Bozzo, first sustaining member of MMPAC. Mrs. Bozzo is retiring Treasurer of the MSMA Auxiliary and President of Franklin-Gasconade-Warren County Woman's Auxiliary; Mrs. Willard C. Scrivner of East St. Louis, Ill., President-Elect of the AMA Woman's Auxiliary and a distinguished guest, received a special gift; Mrs. James Gordon of Jefferson City, Chairman, presents the firs annual Missouri State Medical Foundation Award t Mrs. Donald Fakhoury, President of Clay County Au iliary. The plaque was provided by Dr. Paul C. Whit ner, a Past-President of the MSMA and MSMF.

(Third row) Mrs. James R. Nakada, St. Louis County was co-chairman for the convention with Mrs. Willia E. Moore, St. Louis County (not pictured); Mrs. Wil man, Mrs. Lytton and Mrs. Jones; Mrs. E. E. Kin President of St. Louis County Auxiliary, welcomes th guests.

(Fourth row) Mrs. Gerald L. Miller of Kansas City Legislation Chairman, and Mrs. Scrivner; Mrs. Wil man, Mrs. Chester Young, a Director of the AMA Au iliary, Mrs. Scrivner and Mrs. Erle E. Wilkinson, Pres dent of the Woman's Auxiliary to the Southern Medic Association, who spoke at the Installation Luncheo Mrs. Larry Ozenberger, of Plattsburg, AMA-ERF Chai man for the MSMA Auxiliary.

MSMA Auxiliary Holds Annual Convention

DOCTORS' DAY
MARCH 30
1973
Park Plaza

roots member in State Society business. The Committee felt that increased emphasis on the part of the State Medical Society on relevant issues with increased opportunities for participation of members in discussion of these issues is necessary. It also was felt that relevant issues should be discussed and action should be taken on a Councilor District level as well as on a local society level, rather than confine the majority of action and discussion to Council meetings. It also was was felt that even more improvement in dissemination of information on "gut issues" is badly needed.

Dr. Hetlage reported that the second phase of the discussion on the MSMA confined itself to the previously proposed need for a change in the Council structure and in presidential rotation and election. Fourth Councilor District Delegates and all officers of the component societies unanimously favor the changes as outlined in the resolution submitted to the House of Delegates in April.

They further would encourage changes which would permit a more frequent rotation of councilors and would favor changes which would permit the selection of the President from the floor of the House of Delegates, rather than by automatic election of the Council Chairman to that position. A discussion was held relative to proportionate representation, and a resolution to this effect will be presented to the Council at its September meeting.—**Referred to Reports of Officers Committee.**

■ The Committee requests a detailed report of the progress of Dr. Peterson's Committee on Negotiation of Professional Fees and his plans for action within this committee. The Committee has requested his presence or the presence of a member of his committee at a forthcoming Councilor District Conference.

The Committee brought up the matter of the information on the bylaws of the Health Care Foundation and the drug resolution which had not, at that time, been received. This material, however, was received in the mail on June 1.

A motion was made and passed approving on a district level the plan presented by Blue Shield for an open panel comprehensive Blue Shield Program. This program has been developed with wide district consultation through a large and active advisory committee and has been explained in detail to the members of the component societies.

Prior to adjournment, it was decided that the format of the meeting and the content of discussion was better than at any previous meeting of this type and that these meetings would be continued on a regular basis on the Wednesday prior to the Council meetings. It was suggested that $1.00 per member assessment be paid by the component societies to pay the expenses of this conference. This is to be considered by the component county societies and action is to be taken by them voluntarily, if they so desire.—**Referred to Resolutions Committee.**

■ Dr. Hetlage brought up the matter of the resolution which was passed in the House regarding the failure rate of the state boards, particularly for foreign physicians. He indicated that it was his understanding that one third of the foreign physicians taking the Missouri State Boards do not pass them.

Dr. Mayer indicated that the FLEX examination which was put together by a national board and is in use in some states could enhance the present problem when Missouri goes to this examination. The failure rate of the FLEX examination across the country is high.—**Referre to Medical Education and Public Welfare Committee.**

■ Dr. Hetlage reported briefly on the planned parenthood clinics in St. Charles. With a grant from HEW they came to several gynecologists and said they wer going to start a planned parenthood clinic. They wer told that if the local physicians did not help them, the would bring doctors from St. Louis County to run i The biggest objection to these clinics is their use of nor professional social workers who go out and solic business. Dr. Hetlage indicated that they have take testimony from several people regarding the clinic goin into private hospitals and soliciting patients. It is costin this particular clinic $40 per patient to treat then There is objection to the means by which the clinic wa established by coercion. A representative from HE has been asked for his plans for this particular clini Seemingly, they plan to go into all GYN and OB ca and, if necessary, to enlarge into total medical car Dr. Domke indicated that there has been substanti federal money appropriated for planned parenthood.

Dr. Hetlage reported that Lincoln County has son objections to the manner in which the County Healt Nurse is operating. She is hired by the County Cour In some instances, she is prescribing INH following positive Tine Test. He said that oral polio clinics an measles clinics are being held within three weeks each other.

Several of the Councilors indicated that the topic planned parenthood clinics will be brought up in the reports and it was agreed that this matter be table until all Councilor District reports were made.—**Referre to Miscellaneous Affairs Committee.**

■ *District #5*—Dr. Cope indicated they had two cas reviewed by the Health Care Foundation, both Med care cases. The Foundation decided in favor of the ph sician in both instances. The effect on the carrier wa in one instance, no response. In the other case, a sizab increase in the amount was allowed on the basis of mistake by the carrier in its computer programming. D Cope indicated that if the HCF is going to be a on way street, it isn't going to lead very far. He indicate this was given to the Council only for their informatio

Dr. Cope reported on what he considers a very serio situation taking place on his district and probably oth parts of the state and country. The Boonville Medic Group has a policy of requiring payment before ar Medicare forms are filled out. This policy is spelled o and posted on the office wall. The patients are told th they do not accept assignment. One particular patie accepted treatment under these circumstances. He r ceived a bill from the clinic stating so much for medic care, so much for laboratory services, etc. He took th statement to the SSA office in Sedalia and they indicat to him that the statement was not adequately itemiz for their use. The Boonville Medical Group was inform that they were in violation and any patient must given the equivalent of an unassigned Medicare for Dr. Cope submitted a report regarding this to the Med care carrier with a copy going to the AMA. In essenc the AMA agreed with the position that the Group w in violation of the AMA recommendations if they d not give an adequately itemized statement to the patier so that he can collect from Medicare. It was Dr. Cop opinion that this is pressure that SSA is putting on ph sicians to take assignment.

Mr. Smith reported that this had come up in Jackson ounty. He indicated that he did research on AMA ac-ities in this regard. He stated that the original Medi-re regulations required that the patient pay his bill d then be given a receipted statement to use to ceive Medicare payment.

Mr. Smith indicated that at that time, the AMA felt is was not right, since many patients could not pos-bly pay their bills prior to receipt of the payment from edicare and the AMA asked for the change. Mr. Smith ated that he felt this is well substantiated by the AMA.

The Chairman referred the Boonville Medical Group atter to the Standing Commission on Medical Eco-mics, Third Party Medicine and Governmental Rela-ns which is chaired by Dr. Peterson.—**Referred to Res-utions Committee.**

District #6—Dr. Bradshaw reported that the Golden alley Memorial Hospital has opened. It is a 100-bed ospital and serves about 107 patients all the time.

Dr. Bradshaw discussed the medical manpower prob-m in the state and indicated that we have tried to take me leadership in this problem. There are now young eople practicing in the state who are on federal pay-lls. He indicated that many rural Missouri towns that e badly in need of physicians do not have the back-round information and do not know how to go about etting such physician manpower. He stated that he is ure many of these physicians are meeting real needs, ut many of them have not. Dr. Bradshaw feels that here should be someone to determine where the needs re and that, perhaps, the MSMA Council or the Divi-ion of Health or both might serve as a clearing agency determine the manpower needs.—**Referred to Medical ducation and Public Welfare Committee.**

■ Dr. Bradshaw expressed his concern regarding help-ng individuals who have been arrested on drug addic-ion charges or for sale of drugs. Many times, they pend many months in jail. It is the contention of some awyers that if the case is drawn out long enough, the harges will be reduced or possibly dropped. When the ddict does get out of jail, he finds that jobs are difficult o get and he has no visible means for paying his attor-ey's fees. In many instances, he turns back to the sale f drugs to aid his financial situation. Perhaps some hange should be made in the legal procedure so that rompt action can be taken. Dr. Bradshaw indicated that e feels that our system is perpetuating such problems nd stated that he feels this is part of the medical com-unity's concern.—**Referred to Miscellaneous Affairs ommittee.**

■ Dr. Bradshaw brought up the matter of M.D.s and D.O.s practicing together. He stated that a group of D.O.s in his locality have approached several M.D.s ver the state about coming and practicing with them. He said that there is one M.D. practicing on the staff f this group now. He indicated that he would like to ear reflective thinking from the Council members re-garding such an arrangement.

Dr. Bradshaw reported that a joint meeting of the Henry, Johnson, Pettis, Lafayette-Ray and Saline Coun-ty Medical Societies was held on Wednesday, May 31, in Sedalia and was well attended. Three physicians from the University of Missouri presented the program re-garding some of the recent innovations at the University and held a question and answer period. He said that it was very enjoyable meeting.—**Referred to Medical Education and Public Welfare Committee.**

■ Dr. Bradshaw indicated that they too have the family planning clinic in the community and he is one of the physicians who is trying to help them.—**Referred to Miscellaneous Affairs Committee.**

■ Dr. Bradshaw stated that he would like to see the Health Care Foundation be expanded into doing hospital review. He stated that he feels the need for his particular hospital to have a total review by some outside and disinterested party. He said that possibly this could be done for small hospitals of less than 150 beds or, perhaps, on a staff-size basis and he would like to see the Foundation do such a review on a request basis. —**Referred to Resolutions Committee.**

■ Dr. Bradshaw reported that a physician who is a conscientious objector will be spending his service time working with him beginning July 1. He said the physician seems to be a very bright young man and he is happy to have him.

District #7—Dr. Chandler reported that the Kansas City Bar Association, Jackson County Osteopathic Association and the Jackson County Medical Society have completed work on a detailed interprofessional code.

Jackson County Medical Society sponsored a dinner meeting at which Dr. Russell Roth, Speaker of the AMA House of Delegates, was the spokesman. Four AMA Delegates were present; two were from Kansas. There was a question and answer period.

Dr. Chandler called attention to an article from the *Kansas City Times* headlined, "Expense Account." This article spoke of organized tours as being only a tax dodge unless more actual medical papers are presented.

He reported that Dr. George Lytton has been elected President of the Urban League in Kansas City.

District #8—Dr. McAlhany reported that Dr. E. A. Hoffman, President-Elect of the AMA, will visit in Springfield on November 16. During the day, he will be at Drury College and he will be the guest of Greene County Medical Society in the evening. This event probably will be held at the Howard Johnson Convention Center with a social hour at 6 PM or 6:30 PM. He urged the Council members and officers to make every effort to attend and indicated that more detailed information will be supplied at a later date. He did state that this meeting conflicts with the Caribbean Cruise which is being sponsored by MSMA.

District #9—Dr. Cooper indicated that the main problem in his area is still manpower shortages.—**Referred to Medical Education and Public Welfare Committee.**

■ *District #10*—Dr. Hansbrough reported that their local extended care facility, which is the Lucy Lee Annex, had come under a great deal of fire by Blue Cross of St. Louis. He stated that he had sent a patient to this ECF for rehabilitation following hospitalization with a fractured hip. She remained there for only nine days and was told that was as long as she could stay. Dr. Hansbrough communicated with Rep. Burlison regarding this situation and he has now received a letter which opens the door and the ECF will accept almost anybody.

Dr. Hansbrough indicated that the Department of Health provided him with the National Health Services applications. There are two physicians being assigned to

New Madrid under this program. They had three physicians, but all have left. Two have gone into practice in Cape Girardeau. He said their reason for leaving was due to the inadequate fees being paid under Medicaid. He stated that he feels this bill was written to see that indigent people do receive adequate medical care. He said that he felt the Council should determine if anything can be done about these fees. He stated that the community has to apply for these physicians. They come through the Regional Offices of HEW. Ordinarily, these physicians are assigned to communities of less than 4,000 population, although exceptions will be made in extreme cases of isolation, etc. The state and local medical societies have to certify the need as well as the local government. Other health organizations are encouraged to comment.

Dr. Hansbrough reported that Lilbourn, a community of less than 1,000 population in his district, is served by one D.O. and has applied for a federal HMO. It was approved by the Bootheel Comprehensive Health Planning Agency by a vote of 6-4 with some abstaining. He stated that he understands that this did not receive later approval. It has a budget of $373,320. No physician was written into the budget. He stated that he is under the impression that this was not community-oriented, but that it came down from the federal government that this is a good place to try one of these.

Dr. Hansbrough expressed concern that people in rural areas should be educated to the fact that with today's modes of transportation, one does not necessarily have to have a physician in town as long as there is one within a reasonable distance. He indicated that he felt transportation might be the problem rather than physician location.

Dr. Hansbrough indicated that he had sent 51 Medicaid case reports from his clinic to the Health Care Foundation for review. The Fifth Region of the HCF review them and they received 100% approval. He stated that he hopes the HCF will transmit this information to the Division of Welfare. He said that he is concerned over the fact that 35% of the cases have been in favor of the physician and 65% in favor of the carrier.

Dr. Hansbrough cited a case of a physician in his area whose last check from Medicaid was in the amount of $1.90. He contended that it would be cheaper to treat the patient at no charge than to fill out the Medicaid forms.—**Referred to Resolutions Committee.**

■ Dr. Hansbrough stated that they do have some ter ribly strong reactions toward the Constitution and Bylaw change regarding referendum that will be voted on a the next meeting. He indicated that if the metropolita areas would get together, they would be able to cal for a statewide referendum. Dr. Hetlage stated that St Louis County Medical Society is worried about it, also **—Referred to Constitution and Bylaws Committee.**

■ Dr. Hansbrough reported that there is a planne parenthood clinic operating out of the Butler Count Health Department. It is being run by one of the loca GYN's, Dr. Carlson. He indicated that they feel it is problem, and the physicians are trying to help in th situation. He stated that it is costing them $67 per pa tient. They will not do therapy there. The doctors fee that there is a certain number of people who can b reached through this clinic who will not come to th physician's office or who cannot get funding anywher else. He stated that Dr. Carlson is running for the Coun ty Health Board. If elected, he will be on the decision making end of the Board. Dr. Hansbrough reiterated th feeling that physicians must become involved in thes planned parenthood clinics.

Dr. Hansbrough indicated to the Council that he fee it should go on record, following all of the other group with the exception of the TB Society, as condemnin the use of the portable X-ray unit.—**Referred to Mis cellaneous Affairs Committee.**

■ Speaking to Dr. Bradshaw's problem regarding M.D and D.O.s, Dr. Hansbrough stated that he felt that th group needs a very strong physician. If they had one, h could see no reason why this group could not be compose of M.D.s and D.O.s. He said that you must get th right, strong personality, and he will update the grou **—Referred to Medical Education and Public Welfar Committee.**

■ Regarding the possible hospital review by the HC he stated that the JCAH has a fine mechanism for sel evaluation. He indicated that he felt the idea of th HCF doing hospital review is a good one, but state that manpower will be a problem.—**Referred to Resol tions Committee.**

■ This concluded the Councilor District Reports.

The Chairman pointed out that the following iten were brought out in the Councilors' report and woul

---

The Annual President's Banquet on March 31 was a highlight of the Annual Session. The Honorable William C. Phelps, Lieutenant Governor of Missouri was the guest speaker.

(Left to right, first row) President E. A. Stricker spoke briefly after accepting the President's gavel from retiring President Walter T. Gunn; Dr. Gunn accepts a plaque of appreciation from Dr. Stricker and the MSMA; Lt. Gov. William C. Phelps.

(Second row) Dr. and Mrs. Billy J. Bass, Salem; Mrs. Erle E. Wilkinson, President of the Woman's Auxiliary to the Southern Medical Association with Mrs. Willard C. Scrivner, President-Elect of the AMA Auxiliary and Mrs. Frank R. Bradley, St. Louis; Mrs. Arthur W. Neilson and Dr. Neilson, MSMA Delegate to the AMA.

(Third row) Dr. and Mrs. Charles E. Nickson, J Independence; Dr. Truman B. Schertz, MSMA Vic President and Mrs. Schertz, North Kansas City, and D and Mrs. William R. McPhee, Kansas City; Dr. Paul Whitener, a Past-President of the MSMA and Mr Whitener, St. Ann.

(Fourth row) MSMA Past-President Gerald L. Mill and Mrs. Miller, Kansas City; Allen D. Smith, Executi Secretary of Jackson County Medical Society, with Mr Smith and Mrs. George J. Lytton and Dr. Lytton, Ka sas City; Mrs. Stanley S. Peterson and Dr. Peterso MSMA Delegate to the AMA.

The Annual President's Banquet

now be further discussed by the Council:

1. Planned Parenthood Clinics
2. Central Clearing Agency for Health Manpower
3. Peer Review—Extending to Hospitals by HCF
4. Fees under Medicaid
5. Education concerning traveling to the doctor's office rather than trying to get a doctor in every community
6. Constitution and Bylaws Change
7. TB Unit
8. Problem of D.O.s and M.D.s on same staff
9. Legal provisions on drug abuse problem.

PLANNED PARENTHOOD

Dr. Hetlage stated that they certainly favor these clinics as they feel the clinics reach people who would otherwise not come into private offices and that this is an important medical problem. He indicated that local control is necessary and the clinics are being pressed beyond what the local doctors want them to do. He stated that they have written a letter suggesting an advisory board of four GYN's who would review the operation of the clinics.

Dr. Martin indicated that the family planning clinics in his area are through the Family Guidance Clinic under the United Fund. The family planning part is run by the GYN's. He stated that this seems to be an ideal situation and is well controlled.

Dr. Chandler indicated that he would like more background information on this, such as where does the money come from, is this a statewide agency under one central office; etc.

Dr. Cope asked that rather than go into background at this time, that this be a staff function, and at the next meeting, the Council will have a more comprehensive, factual background on family planning activities.

Dr. Bradshaw then moved that an Ad Hoc Committee of this Council be appointed to investigate and make recommendations concerning family planning activities. The motion was seconded by Dr. Hetlage and carried.

Dr. Stricker indicated that there is a planned parenthood clinic in this area and that he was approached recently, indicating that the clinic had instructions to extend their services to diagnosis and treatment of VD. He said that the doctors did not go along with any treatment except that in the physicians' offices. The clinic will pay the physician and collect from the patient on the basis of his ability to pay. The physician will be paid in full provided that the clinic makes the appointment with the doctor.

Dr. Cope stated that Staff will get all the information they can on this subject and an Ad Hoc committee will be appointed.—**Referred to Miscellaneous Affairs Committee.**

HEALTH MANPOWER

■ The next item discussed was the National Health Service Corps and the need for health manpower within the state. It was indicated that a statement of need signed by the state and local medical societies is required before a community can receive a physician through the National Health Service Corps. It was suggested that, perhaps, it would be well if there were a central clearing agency to help in the process of placement of physicians.

Dr. Domke pointed out that approximately a year and a half ago, the Division of Health, in cooperation with MSMA and MAOPS, set up a Physician Placement Cc ordinating Committee. This committee is in the proces of obtaining physician distribution data from the Stat Board of Registration for the Healing Arts. Within few weeks, it should have up-to-date information o physician distribution in the state.

Dr. Bradshaw stated that he thought there is nee for a central clearing agency. He also suggested tha a system of priorities should be set up. Dr. Domk pointed out that perhaps the data received by the Phy sician Placement Coordinating Committee can produc information that will help in the development of guid lines.

Dr. Bradshaw moved that the Physician Placemer Coordinating Committee accumulate data and make available to the Council and that the Council take pos tive steps toward developing a criterion for priority sy tems of physician placement in Missouri. The motio was seconded and carried.—**Referred to Medical Educa tion and Public Welfare Committee.**

TOTAL HOSPITAL REVIEW

■ Dr. Bradshaw expressed concern over the fact th small hospitals with small staffs are probably incapabl of effective peer review. He indicated that many Mi souri hospitals need outside medical input and he woul like to see the Health Care Foundation expand the activities to involve complete hospital review.

Dr. Benoit indicated that the HCF Board of Directo would meet on Sunday afternoon and he would brin this matter up at that time. Dr. Benoit stated that pe haps the Foundation could act as a back-up group t utilization review committees in hospitals. Dr. Beno indicated that this would be on a voluntary basis. Eac hospital would have to request a review. There wa discussion regarding at what given intervals this revie should be done if the Foundation agreed to hospit review.

Dr. Miller moved to pass the feeling of this grou on to the HCF Board and await their reply. The motio was duly seconded and carried.

FEES UNDER MEDICAID

During a Councilor District report, the matter fees under Medicaid was discussed. After discussion, was decided that staff should get information on th subject and that this matter will be on the agenda f the next Council meeting. The Ad Hoc Committee o Negotiation of Professional Fees will look into this ma ter.—**Referred to Resolutions Committee.**

PUBLIC EDUCATION ON PHYSICIAN AVAILABILITY

■ There is a need to educate the public to the fact th it is not miles, but time that is important in obtainin medical care. It is not necessary for a community have a physician, but only for a physician to be the immediate vicinity.—**Referred to Medical Educati and Public Welfare Committee.**

CHANGE IN CONSTITUTION & BYLAWS REGARDING REFERENDUM

■ There was discussion on the change in the Constituti & Bylaws regarding referendum. It was noted that the was opposition to this. It was pointed out that if t Councilors are not in agreement with this change, th should make their opposition known to their respecti legates and their delegates can vote accordingly when is issue comes up for approval at the 1973 House of legates. It was agreed that this matter should be iced on the agenda for the January Council meeting. **Referred to Constitution and Bylaws Committee.**

PORTABLE X-RAY UNITS

The matter of using portable X-ray units in the de- tion of tuberculosis was discussed. It was agreed to fer this matter to an existing committee or commission study and recommendations. This matter was re- rred to the Commission on Public Affairs.—**Referred to iscellaneous Affairs Committee.**

M.D.-D.O. ASSOCIATION IN GROUP PRACTICE

There was discussion regarding problems involved in e association of M.D.s and D.O.s in partnerships. Dr. etlage stated that in checking the insurance problem in- lved in M.D.-D.O. partnerships, some insurance com- nies will not insure such a partnership. He said that had been his experience in his area that when there d been cooperation between M.D.s and D.O.s, the re of patients had been upgraded. Dr. Miller indicated at the AMA had had some discussion on this subject d he thought there was some decision made at a cent meeting. Dr. Benoit indicated that he remembered at there had been a great deal of dialogue on this bject, but he did not recall that any action had been ken. Dr. Cope asked the Staff check into this and give e Council an answer.—**Referred to Medical Education d Public Welfare Committee.**

REPORT OF WOMAN'S AUXILIARY

Mrs. Jones thanked the Council for inviting her to the eeting and said that it had been very interesting. Mrs. nes reported that approximately 120 women had at- nded the Woman's Auxiliary Day at the Legislature d that seven Senators from the Public Health Commit- e had attended the luncheon. She stated that she hoped at the women would become better informed on poli- s. She reported that the Auxiliary is already planning legislative day for next year and she hopes that it will able to entertain all members of the Legislature and, rhaps, have the Governor address them.

Mrs. Jones reported that two regional workshops had en held in Kansas City and St. Charles and both had en well attended by the officers. She expressed the pe that more members will attend the next workshop. ne also reported that the circulation manager for *Mis- uri Doctor's Wife* had advised her that the Auxiliary w has a master list of members and will not need to e the MSMA addressograph equipment.

Mrs. Jones reported on the Fall Conference of the oman's Auxiliary which will be held on October 24-25 the Ramada Inn in Columbia. This conference will e held in conjunction with the Fifth Councilor District eeting. She stated that there will be a benefit dinner r the Missouri State Medical Foundation on the first ening. On the second day, the Auxiliary plans a Health ducation Day. Mrs. Jones asked for Council support by -sponsoring this and, perhaps, an Ad Hoc committee ould be appointed to assist the Auxiliary. She also in- icated that the Auxiliary may need minor financial sup- ort.

Mrs. Jones thanked Dr. Gunn for sending a telegram ongratulating the AMA Auxiliary on its 50th Anniver- ry. Mrs. Jones invited all wives attending the AMA Annual Session in San Francisco to a breakfast on June 19. Mrs. Jones introduced Mrs. Irene Miller, Legislation Chairman for the Woman's Auxiliary.

Dr. James C. Cope *(left)*, **MSMA President-Elect for 1973-1974, congratulates Dr. Donald Judd of St. Louis who was elected as Treasurer of the MSMA for the coming year. Dr. Judd is President of St. Louis Medical Society.**

Dr. McAlhany moved acceptance of the report with commendation. Dr. Cope indicated that in accepting the report, the Council also is directing the appointment of the ad hoc committee requested by Mrs. Jones. The motion was seconded and carried.

APPOINTMENT OF COUNCIL COMMITTEE

Dr. Cope appointed Drs. Franklin, McAlhany, Hansbrough and Cooper to serve on the Council Committee on Membership Communications.—**Referred to Reports of Officers Committee.**

SELF-TESTING PROGRAM FOR LABORATORIES

■ Dr. Blaine Hibbard, Kansas City internist, reported to the Council on the recently-developed program for self-evaluation of laboratory services known as a Proficiency Evaluation Program (PEP). This is a voluntary program sponsored by the American Society of Internal Medicine and the College of American Pathologists and has been developed for the quality control of physician's office laboratories.

This program provides a confidential data to assist physicians in evaluating the performance of their own laboratories. Test materials and instructions are sent to the physician four times a year. Test results obtained by the physician's laboratory staff are sent to an impartial computer processing center. These results are compared to the performance of the participating office laboratories and reference laboratories for the same tests. A confidential report is sent to the physician. Dr. Hibbard stated that this testing program can assure the physician that what he is doing in his own laboratory is of high quality. He indicated that he felt there is a good chance that some of the third party carriers will require some measure of proficiency evaluation if they are going to pay for it.

Dr. Hibbard asked the Council's endorsement of this program and indicated that he would like to write an article recommending this type of program to appear in Missouri Medicine. Motion was made and seconded that the Council accept endorsement of this program. The motion carried.

REPORTS OF THE MEDICAL SCHOOL DEANS

Dr. William Mayer reported that on May 16, the University of Missouri School of Medicine-Columbia graduated 98 new M.D.s, the largest graduating class in its history. There will be 110 incoming students in September: 102 Missourians out of 570 Missouri applicants and eight out-of-state students out of 970 applicants. The Board of Curators recently passed a resolution indicating that it would be appropriate for the professional schools to accept approximately 10% out-of-state students in their classes.

Dr. Mayer stated that he and other members of his staff have been invited and have participated in various county medical society and district meetings and indicated that he appreciates these opportunities to become involved in organized medicine.

Dr. Noback reported that the University of Missouri-Kansas City will have 72 new students this year. He said that the initial two years has pointed out that the combined Arts and Sciences medical school program works well. The docent program also is working well. He stated that they have been working with Dr. Jack Stelmach and will have family practice preceptorships this summer.

Dr. Noback indicated that people have been impressed by the curriculum book which has been assembled.

Dr. Thoma indicated that Dr. Felix will not retire this year since his time was extended by the St. Louis University Board of Trustees.

He stated that St. Louis University graduated 117 medical students recently. For the coming September class, they have had 5,400 applicants and are accepting 154 students. He stated that the Dean of Admissions estimated that about 600 applicants with a grade point average of 3 or better cannot be accepted because of lack of space. He said this is regrettable. St. Louis University has accepted between ten to 15 disadvantaged minority students. Almost all do not meet the standards, so a bridging course has been developed for the summer to try to bring these students up to the standard.

Dr. Thoma reported that for the past year they have had a Blue Print Committee studying how to teach comprehensive ambulatory care. There will be a final report of this committee, and he indicated that he would be glad to share it with anyone interested.

Dr. Thoma reported that ground has been broken for the $15 million modernization and expansion program of the University Hospital basically for ancillary services.

It was pointed out by a Councilor that Washington University has rarely been represented at Council meetings.—**Referred to Medical Education and Public Welfare Committee.**

MATTERS REFERRED TO THE COUNCIL BY THE 1972 HOUSE OF DELEGATES

■ *Resolution #25—Smallpox Vaccination*—Dr. Domke reported that a committee of the Division of Health is presently being formed in the field of communicable diseases. He stated that the MSMA will have representation on this committee and this particular matter will be one which the committee will discuss.

On motion of Dr. Miller, duly seconded, it was agree that this matter be tabled until the Division of Healt Committee on Communicable Diseases is formed an functioning.

Resolution #33—Pediatric Coordination Council *Missouri*—The Chairman referred this resolution to th Commission on Public Affairs.

Resolution #35—Restrict Usage of Amphetamines an *Resolution #39—Foundation Bylaws to Membership*- It was reported that a pledge card regarding the am phetamines and a copy of the Constitution and Bylaw of the Health Care Foundation have been sent to th membership of MSMA.

Resolution #37—Emergency Services in Kansas City- The Chairman indicated that a copy of this resolutio had been forwarded to Mr. Allen Smith. Dr. Miller i dicated that the resolved portion states, "That MSM cooperate in whatever manner is deemed advisable b our Officers and Council." He stated that the MSMA h been active in this field for several years. He suggeste that all information on MSMA efforts in this field shoul be passed on to Mr. Smith, so that not only MSMA efforts for the Kansas City plan, but statewide effor regarding emergency services should be made known.

Mr. McIntyre stated that he had talked with D Bowles who said that he is in the process of naming h Ad Hoc Committees and Dr. Klippel again will named as Chairman of the Ad Hoc Committee on Eme gency Medical Services and will continue this progra He also stated that there will be a statewide meeti on emergency medical care services in Jefferson City August. This is a federally-funded program under CH

Dr. McAlhany stated that the city of Springfield h appropriated $600 to make five or six tapes to help D Cook work with the ambulance personnel. There is su a rapid turnover.

Dr. Thoma reported that the Bi-State RMP, acting f a separate corporation with which Drs. Klippel and Co rad are involved, has applied for a federal contract emergency services in the metropolitan areas. He i dicated that St. Louis is to be site visited in the ne future to see if they will be funded.

Dr. Cope indicated that the resolution asked that t MSMA cooperate and stated that we certainly will n discontinue our efforts statewide.—**Referred to Misc laneous Affairs Committee.**

■ *Resolution #40—Failure Rate of State Board Exa inations*—The Chairman referred this resolution to t Commission on Continuing Education and Health Ma power.—**Referred to Medical Education and Public W fare Committee.**

■ *Resolution #41* was discussed. This resolution resolv that, "The Health Care Foundation of Missouri, Inc., w not review any issue unless the parties requesting t review agree to be bound by the decision of the HCF with the privilege of appeal." A copy of this resoluti has been forwarded to the Health Care Foundation. **Referred to Resolutions Committee.**

■ Dr. Miller indicated that he had received various co ments on the pledge cards regarding restriction of a phetamine usage. He said that many physicians do realize that this is a problem and cannot understand w they should be challenged. Dr. Cope indicated that will turn this problem over to the new MSMA Pub Relations Director.—**Referred to Miscellaneous Affa Committee.**

REPORT OF THE AMA DELEGATE

Dr. Neilson reported to the Council on activities of e upcoming San Francisco meeting. He indicated that will prepare a resolution regarding the death of Dr. endell Scott to be presented on the floor of the House. ie Delegation will work for the reelection of Dr. Ver- n Wilson to the Council on Medical Education. He ited that they would be ready to take part in the honor hich the AMA will bestow on Dr. Durward Hall. The SMA delegation will present two resolutions. Dr. Neil- n indicated that both he and Dr. Benoit will chair ref- ence committees.

Dr. Neilson indicated that during the last several years, ere has been a change in the attitude of physicians ward the AMA and, in a sense, toward the delegates. me physicians do not feel that their delegates truly present them. He stated that he felt the MSMA delega- n has tried to represent Missouri medicine and to take the AMA those thoughts which the House and the uncil have expressed. He said there has been an in- easing cry about the lack of "grass roots" physicians' fluence on "The Establishment." Dr. Neilson stated at there will be an airing of some of these problems at e San Francisco meeting. He stated that "as delegates, e need instruction from this body." The AMA House of elegates will be confronted with serious proposals to ange the rules and to make association policies and ograms more responsive to the needs and demands of e grass root membership. The following items will un- ubtedly receive airing at the San Francisco meeting:

The State Medical Society of Wisconsin, at the 1971 MA Clinical Meeting, pressed the House to order pub- c hearings by the Council on Long Range Planning and evelopment so that physicians throughout the country uld air criticism of AMA structure, programs and pol- ies. Dr. Neilson indicated that he had written to mem- ers of the MSMA Council and the delegates to deter- ine whether they wished the MSMA delegation to ap- ear as witnesses at the hearing and what they wished to e presented.

The Harris County Medical Society at Houston, Tex., as voted to support a constitutional convention and to shape the AMA and to rededicate it to the private prac- ce of medicine.

The Colorado delegation to the AMA House has been irected to urge action to effect a significant revision of e internal organization structure of the AMA.

Michigan State Medical Society has adopted a resolu- on asking for reassessment of AMA structure, function nd purpose.

Dr. Neilson stated that the AMA seemingly has been nable to do much about the increasing number of in- idents in which the government has intruded further nd further into the practice of medicine.

There has been an attempt in San Francisco to orga- ize a union of Bay area physicians. The AMA has op- osed unionism. Florida's House of Delegates has reated a statewide "guild" similar to a union.

Maryland's House of Delegates passed a resolution es- ablishing a commission to study collective bargaining nd institution of class actions in behalf of the medical rofession in the AMA.

There also is the matter of the American Hospital As- ociation and its relationship to the AMA.

It has been prophesied that some form of national ealth insurance will become law by 1974.

Dr. Neilson stated that there also is the matter of a separate national House Staff organization.

The California Medical Association has expressed to their congressman and health committee leaders its strong concern over HEW's aggressive HMO spending following the CMA Council's call for a moratorium on HMO projects in the state.

The Wisconsin physicians who participated in the first pilot hearings conducted by AMA's Long Range Planning and Development Council want direct election of AMA delegates, early involvement of interns and residents on medical societies, AMA activities and placing leadership structure into the hands of young physicians. They also stressed improved AMA communications as a must. California is now polling its physicians to determine whether they wish to elect AMA delegates by popular ballot or through their district delegations.

Pennsylvania Medical Society has begun a mandatory continuing education program as of July 1.

Dr. Neilson stated that an open hearing by the Council on Long Range Planning of the AMA will be held on Saturday, June 17, and the delegation plans to prepare a ten-minute testimony summing up the thinking of the Council on the problems facing physicians and its desires in regard to changes in the AMA that will help solve these problems. Testimony can be presented on the 17th, but we need to submit a written statement immediately and then there will be our oral appearance before the Committee. Dr. Neilson stated that if we can't get this together in this short period, we can present your views in Cincinnati on November 25.

Discussion followed as to how to direct the MSMA delegation in regard to the hearing by the Council on Long Range Planning:

It was suggested that possibly the AMA Speakers' Bureau should conduct a state-to-state campaign to talk to the physicians directly.

Regarding the subject of a negotiating mechanism, it was brought out that the MSMA has told Dr. Peterson to proceed with further development.

On National Health Insurance, the MSMA should let the legislators know that the AMA wants to be consulted.

Dr. Benoit stated that we are not forced to do this in two weeks. He suggested that, possibly, the Councilors would like to think about this during the next several months and come to the Council meeting in September with a definite statement to be made at the Clinical Session in November.

Dr. Peterson indicated that we want to be sure that we don't condemn the AMA for what they are doing unless we can come up with a better way.

Dr. Neilson stated that he felt that many of the things the AMA is being asked to do they are already doing.

Dr. Hetlage stated that he felt the AMA could not be changed effectively without changing the MSMA and the local medical societies.

Dr. Cope then suggested that Dr. Neilson's report be reproduced and given to the Council and that the Council make positive recommendations for the delegates at the Cincinnati meeting.

Dr. McAlhany stated that he felt some recommendations should be made now.

Dr. Bradshaw suggested that a positive recommendation be made that we need more factual information about what is presently going on by word of mouth. He

Progress

Diagnosis

In these illustrations of tissue from a patient with acute cystitis, you can see the swollen and inflamed mucosa of the ureteral orifice (50×), a fibrin strand (300×), and a whitish exudate composed of polymorphonuclear leukocytes (1000× and 3000×). The photographs were taken with the scanning electron microscope (SEM) by Dr. Shirley Siew, Associate Professor of Pathology at the University of Pittsburgh School of Medicine. They come from the clinical exhibit "Scanning Electron Microscopy of Urinary Tract Infection," which won first prize in Clinical Research at the May 1972 meeting of the American Urological Association.

The scanning electron microscope promises to be extremely useful in its investigation of human pathology. In time, examination of tissue with the SEM is likely to play a significant role in the diagnosis of urinary tract infection.

Before prescribing, please consult complete product information, a summary of which follows:

Indications: Nonobstructed urinary tract infections (mainly cystitis, pyelitis, pyelonephritis) due to susceptible organisms. **IMPORTANT NOTE:** ***In vitro*** **sensitivity tests not always reliable; must be coordinated with bacteriological and clinical response. Add aminobenzoic acid to follow-up culture media. Increasing frequency of resistant organisms limits usefulness of antibacterial agents, especially in chronic and recurrent urinary infections.** Maximum safe total sulfonamide blood level, 20 mg/100 ml;
measure levels as variations m

Contraindications: Hypersens
sulfonamides; infants less tha
months of age; pregnancy at t
during the nursing period.

Warnings: Safety in pregnanc
lished. Do not use for Group A
lytic streptococcal infections,
(rheumatic fever, glomerulon
are not prevented. Deaths rep
hypersensitivity reactions, agr
tosis, aplastic anemia and oth
dyscrasias. Sore throat, fever,
purpura or jaundice may be e

ting chronic or recurrent
ucted cystitis, pyelitis or
hritis due to *E. coli* and
ceptible organisms. (See
t Note in summary of product information.) Complete blood counts and urinalyses, with careful microscopic examination, should be performed frequently.

high solubility Gantrisin (sulfisoxazole) Roche is one of the most soluble of all sulfonamides, with both free and acetylated forms highly soluble in the commonly encountered urinary pH range of 5.5 to 6.5. Urine levels have been detected in 60 minutes; therapeutic levels are usually reached in from 2 to 3 hours. About 90% of a single dose is excreted in 24 to 48 hours. As with all sulfonamides, adequate fluid intake must be maintained.

economy Average cost of therapy is still only about 6½¢ per tablet.

total therapy: 14 days Recent evidence in the medical literature suggests that therapy in acute nonobstructed urinary tract infections should be continued for 10 to 14 days even if patients become asymptomatic in 2 or 3 days, as they often do.[1-11] However, one investigator, evaluating a 5-year study of sulfisoxazole used to treat urinary tract infection in 368 girls, found no advantage in continuing therapy more than two weeks *for a first infection.*[12]

For acute, chronic or recurrent nonobstructed cystitis, pyelitis, or pyelonephritis due to susceptible organisms...

begin with
Gantrisin®
sulfisoxazole/Roche®

Usual adult dosage: 4 to 8 tablets *stat*
2 to 4 tablets *q.i.d.*

n should be performed fre-

s: Use cautiously in patients
red renal or hepatic function,
rgy or bronchial asthma.
, frequently dose-related, may
ucose-6-phosphate dehydro-
ficient patients. Maintain
luid intake to prevent crystal-
tone formation.
eactions: *Blood dyscrasias:*
ytosis, aplastic anemia, throm-
ia, leukopenia, hemolytic ane-
ra, hypoprothrombinemia and
lobinemia; *Allergic reactions:*
multiforme (Stevens-Johnson syndrome), generalized skin eruptions, epidermal necrolysis, urticaria, serum sickness, pruritus, exfoliative dermatitis, anaphylactoid reactions, periorbital edema, conjunctival and scleral injection, photosensitization, arthralgia and allergic myocarditis; *Gastrointestinal reactions:* Nausea, emesis, abdominal pains, hepatitis, diarrhea, anorexia, pancreatitis and stomatitis; *C.N.S. reactions:* Headache, peripheral neuritis, mental depression, convulsions, ataxia, hallucinations, tinnitus, vertigo and insomnia; *Miscellaneous reactions:* Drug fever, chills and toxic nephrosis with oliguria and anuria. Periarteritis nodosa and L.E. phenomenon have occurred. Due to certain chemical similarities with some goitrogens, diuretics (acetazolamide, thiazides) and oral hypoglycemic agents, sulfonamides have caused rare instances of goiter production, diuresis and hypoglycemia as well as thyroid malignancies in rats following long-term administration. Cross-sensitivity with these agents may exist.

Supplied: Tablets containing 0.5 Gm sulfisoxazole.

ROCHE

Division of Hoffmann-La Roche Inc.
Nutley, N.J. 07110

stated that he did not know enough about it to give definite recommendations.

Dr. Cope asked Drs. McAlhany, Hansbrough and Bradshaw to formulate a statement or recommendations for the AMA delegation and to have it ready for action of the Council the following morning.

Dr. Miller moved that the matter regarding recommendations to the Missouri delegation concerning AMA organization be tabled until the following morning. The motion was seconded and passed.—**Referred to Reports of Officers Committee.**

APPOINTMENT OF COMMITTEE ON RAPID PRESS RELEASES

■ Dr. Cope pointed out that there is a need to make knowledgeable and effective responses to items appearing in the various news media. He suggested the following way to do this: (1) A committee of one doctor be appointed. This committee could be composed of the President; (2) Staff will compose answers to various items and then seek approval of the committee to release the answer as quickly as possible. Input would come from all over the state.

Dr. Hetlage moved that a committee composed of the President be appointed to work with the staff in developing responses to items appearing in the various news media. The motion was duly seconded and carried.—**Referred to Miscellaneous Affairs Committee.**

REPORT OF THE COMMISSION ON CONTINUING EDUCATION AND HEALTH MANPOWER

■ A meeting of the Commission on Continuing Education and Health Manpower and its ad hoc committees met on May 14. Mr. Fox indicated that the Ad Hoc Committee—115th Annual Session had made an evaluation of the 1972 Scientific Sessions. This is the first year that a number of specialty groups has sponsored scientific sessions as a part of the program. There were 17 sessions sponsored by medical specialists and three general sessions. All reported favorably on the new format. An inquiry has been sent to each specialty and all replies to date indicate that they were satisfied with the format. If invited, they will be glad to sponsor a session next year. The Committee also indicated that this same format will be used for planning the 115th Annual Session.

Dr. McAlhany moved acceptance of this portion of the report. The motion was duly seconded and carried.

Mr. Fox stated that if the Council approves, perhaps the 1974 meeting in Kansas City could be moved to the Crown Center. He indicated that at present, the only available date at the Crown Center is the weekend of April 4-7, 1974, and he would like to hold these dates. Dr. Miller inquired as to whether or not the possibility of using the Alameda Plaza in Kansas City had been investigated. Dr. Cope requested an investigation of the Alameda Plaza.

Dr. McAlhany moved that the dates of April 4-7, 1974, be held at the Crown Center. The motion was duly seconded and carried.

It also was moved that an investigation of the Alameda Plaza be made. This motion was duly seconded and carried.

The report of the Ad Hoc Committee on Health Manpower was presented. Mr. Fox reported that there had been negotiations with the nursing profession for guidelines to be drafted covering four specific patient care services identified by the nursing profession as practice of medicine but actually performed in certain small hospitals by the nurses. Mr. Fox indicated that Dr. Worley the chairman of the Ad Hoc Committee, is planning another meeting with the nurses to resolve differences The results will be reported to the Council at its September meeting.

Mr. Fox reported that the Health Careers Recruitment Program which was developed by the Missouri Hospital Association, funded by RMP and endorsed by MSMA has been resumed. This program is an educational effort to explain to student assemblies the opportunities in health careers. The Hospital Association will be invited to again cosponsor with the MSMA an exhibit booth on Health Careers at the 115th Annual Session in 1973.

It was moved and seconded to approve this portion of the report. The motion carried.

Dr. Paul Young, chairman, gave the report of the Ad Hoc Committee on Continuing Medical Education. He reported that the MECO program will be continued this summer and that there are 12 hospitals in the program involving 19 students.

Dr. Young then reported on the MSMA Continuing Medical Education Program, Phase I and Phase II. Dr Young indicated that a state level CME Conference is scheduled for June 24 and 25. He indicated that the CME Committee, the CME Councilor District Directors MSMA Council and Officers and other interested persons will be invited to attend. He also stated that the following national authorities on CME will address this conference: Mr. LeRoy Erickson, Director, Educational Activities, Pennsylvania Medical Society; Robert Evans M.D., Dean, Rockford School of Medicine, Rockford Illinois and Sigurd Sivertson, M.D., Assistant Dean, Continuing Education, University of Wisconsin Medical School, Madison, Wisconsin. Dr. Young indicated that the budget for this meeting is $825 and that he would like Council approval for the expenditure of this money

Dr. Franklin moved the acceptance of Dr. Young's report and in so doing, authorized the expenditure of funds. The motion was duly seconded and carried.

Dr. Cope noted the absence of Mrs. Bertha Thomas who had requested to be excused from Council meetings. He stated that he will write a letter thanking her for her years of service to the Council.

FUND DRIVE FOR CANCER RESEARCH CENTER

Dr. John S. Spratt, Chief Surgeon for the Ellis Fische State Cancer Hospital and State Coordinator for Cancer Control, presented a brief history and background information on the Cancer Research Center. Dr. Spratt stated that the Cancer Research Center was founded in 1963 as a nonprofit corporation. He stated that when CRC was founded in 1963, the Columbia Chamber of Commerce raised $60,000 seed money for initial operation costs. At present, one building has been constructed and includes a small cancer detection clinic. CRC presently has an arrangement with the Medical School whereby students and residents rotate through the various programs. Currently, CRC has an annual budget of approximately $1,000,000. The Cancer Research Center has entered into a contract with the Missouri Division of Health for the development of a State Tumor Registry.

Dr. Spratt indicated that there is a drive under way to raise $3.7 million for the Cancer Research Center. Aproximately $2.7 million will be used for construction of needed facilities and $1 million will be used to develop new programs. Dr. Spratt extended an invitation to all present to visit the Cancer Research Center.

CANCER DETECTION CLINIC

Dr. James N. Hueser, Director of the Cancer Detection Clinic, presented information on the Cancer Detection Clinic, which is part of the Cancer Research Center. This Clinic was formed to try to develop a plan for the early detection of cancer. At present, the Clinic is being staffed by himself and a practicing gynecologist in Columbia. It is now operated on a fee-for-service basis, but Dr. Hueser indicated that there is a proposal before the National Cancer Institute to fund an expansion program. He indicated that in four months of operation, approximately 100 patients have been examined. Dr. Hueser stated that they are trying to expand to the point where approximately 40 to 50 persons per day could be examined at the Clinic. Dr. Hueser explained the various procedures that are used in examinations at the clinic.

During discussion, it was pointed out that only a small portion of the money collected by the Cancer Society is used in Missouri. Dr. Spratt indicated that he, in his capacity as State Coordinator for Cancer Control, will look into various sources of funding and then be able to make recommendations for future funding.

Dr. Chandler asked Dr. Spratt if he thinks the Council could be helpful. Dr. Spratt indicated that they are trying to develop a cancer control plan for the state of Missouri and that he will need input from and the endorsement of the Council if he is to get appropriate funding for this plan.

Dr. Cope stated that there are three things that need to be considered in regard to the above reports:

1. Do you wish to accept the report of Dr. Spratt on the fund drive for the Cancer Research Center?

Dr. Chandler moved acceptance of this report. His motion was duly seconded and adopted.

2. Do you wish to accept the report of Dr. Hueser for the Cancer Detection Clinic?

Dr. Chandler moved acceptance of the report, the motion was duly seconded and adopted.

Dr. Cope asked the Council what they would like to do in regard to further liaison with Dr. Spratt concerning the use of Cancer Society funds. Dr. Cope then indicated that Dr. Spratt will be asked to attend a Council meeting at a future date and this matter will appear on the agenda at that time.—**Referred to Medical Education and Public Welfare Committee.**

JOINT COMMISSION ON ACCREDITATION OF HOSPITALS WORKSHOPS

■ Mr. Fox indicated that the JCAH had recently revised its standards and is offering workshops to Hospital Administrators and others in order to familarize them with the new standards. He stated that in Missouri, this workshop will be jointly sponsored by the Missouri Hospital Association and MSMA. The Hospital Association has sent out a survey to determine interest in attending such a program. To date, 139 persons have indicated interest in attending a workshop of this type. When the MSMA and the Hospital Association tried to set dates for this workshop, it was found that there were no open dates that could be met by both Associations and the JCAH. It was suggested that this could be combined with the "Mini-Estes" Conference, which will be held on March 1, and that the JCAH Workshop could be held on March 2 and 3. The JCAH charges $50 per person for materials and faculty travel and an additional $30 for administrative costs. Mr. Fox indicated that the Osteopathic Association will not be one of the sponsors of this workshop, but that the workshop probably will include both M.D.s and D.O.s since a number of hospitals in the state have both M.D.s and D.O.s on staff.

The motion was made, seconded and adopted that the council approve the holding of the JCAH Workshop in conjunction with the Large and Small Hospitals Conference.—**Referred to Miscellaneous Affairs Committee.**

REPORT OF THE JOINT COMMISSION ON MEDICAL-LEGAL AFFAIRS

■ The Medical-Legal Committees of MSMA, Missouri Association of Osteopathic Physicians and Surgeons and the Missouri Bar Association held a joint meeting on May 6 and made the following recommendations:

1. That the Associations represented request permission from parent organizations to receive and attempt to resolve complaints arising between physicians and attorneys in their interrelated practice that cannot be resolved at the local level.

2. That the Associations represented should continue to hold joint meetings.

3. That the committees should obtain additional information on pretrial screening panels.

Dr. Matthews requested that the report be amended to include the following recommendation:

4. That the members of the MSMA Medical-Legal Commission discuss the Good Samaritan Law with members of the Bar Association who attend these meetings and encourage them to discourage their members from advising physician clients not to act as good Samaritans because of the danger of liability.

Dr. Hetlage moved that the report be accepted as amended. The motion was duly seconded and adopted. —**Referred to Constitution and Bylaws Committee.**

MSMA SPONSORSHIP OF FUTURE TOURS

■ Mr. Cooper informed the Council that, as of Saturday morning, 95 persons had signed for the Caribbean Cruise. He also indicated that 12 hours of scientific programs are scheduled and that these hours have been approved by the AAFP.

Mr. Cooper then indicated that the Councilors and Officers had previously received information on two different tours of Scandinavia. He requested Council action as to whether or not they wish to sponsor one of these tours.

Dr. Gunn moved that the MSMA sponsor the INTRAV tour to Scandinavia in May or June, 1973. The motion was seconded and adopted.—**Referred to Medical Education and Public Welfare Committee.**

REPORT OF AMA DELEGATES REPORT

■ Following Dr. Neilson's report on Saturday, Drs. Bradshaw, Hansbrough and McAlhany were appointed to a committee to formulate a statement to be given to the AMA Delegation for use at the Annual Session in San Francisco. Drs. McAlhany and Bradshaw presented the following statement:

"The Missouri Delegation recommends that the House of Delegates sponsor a nationwide program to promote the goals and aims of the AMA. We suggest that the AMA, through the Speakers Bureau, organize a state-by-state program which will inform all physicians of the intent of organized medicine."

Dr. Hansbrough stated that he concurred with the original report as given, but that he would like to make an additional report that includes the following five items:

1. That the AMA, through the Long Range Planning Committee, look into the method of election of AMA Delegates.
2. That the AMA should consider setting up a section of hospital physicians, allowing such physicians to be either members of this group or the section in the specialty in which they practice.
3. That the AMA continue to keep an open mind on HMO's, but pointing out that the cost record so far has been poor using for example statistics from medical clinic associations.
4. That the AMA consider statements such as doctors being democratic and be willing to support legislation as desired by the people, but begging for input into such programs about which we should and do have expertise.
5. That the AMA issue no statement on unions.

Dr. Neilson stated that many of the items suggested are already being implemented and that the AMA has good consultative bodies to turn to and their information is up-to-date and first class. Dr. Peterson stated that the way in which delegates are elected is a function of the state society and not a function of the AMA.

Dr. Hetlage made the following recommendation concerning Council position on the AMA:

"That the position of our AMA delegation as instructed by this Council shall be one of change in the structure of organized medicine from the county society level to the higher echelons of the AMA, so that the structure and image of organized medicine shall be relevant to the social and economic structure of society today. That these changes be made only after reasonable and advised study of present structure and the alterations and problems involved in changing established modes of operation."

This recommendation was made in the form of a motion and passed during the summary session.

Dr. Bradshaw stated that he felt that our AMA delegation is well informed and should be able to use its own judgement in our behalf. He saw no point in giving our delegation specific instructions. Dr. Mayer stated that he felt there are no elegant solutions to these problems. He then mentioned the age factor that exists not only in the AMA, but also at the state society level, and felt that this is another problem that should be considered.

Dr. Miller moved that the Council accept the report of Dr. McAlhany as extended by Dr. Hansbrough and that this, together with the deliberations, be submitted to the AMA Delegation for appropriate use as they see fit at the Annual Session in San Francisco. Councilors should make further study of this and give specific instructions to the AMA Delegation in September. The motion was duly seconded and adopted.—**Referred to Reports of Officers Committee.**

REPORT OF THE COMMITTEE ON LEGISLATIVE AFFAIRS

■ Dr. Matthews reported on legislation supported by the MSMA that was passed; legislation opposed by MSMA that did not pass; and legislation that passed that was of interest, but upon which MSMA did not have a position.

Dr. Matthews stated that the passage of Concurrent Resolution #5 was of special interest. This resolution establishes a joint committee of Senate and House members to investigate the deficiencies in the federal-state medical care programs, the general costs and operations of providers of medical care and to establish viable alternatives or improvements to our present system of medical care in the state.

Dr. Matthews indicated that the Legislative Committee is planning needed legislation and hopes to have the following bills ready for early introduction next Session: 1. Legislation to provide for the establishment of ambulatory care centers; 2. Legislation to provide for immunity from liability for review physicians; 3. Legislation to provide a broad consent bill; and 4. Legislation to provide for mandatory labeling of prescriptions.

Dr. Miller stated that he would like to see changes in the Nurses Practice Act to allow for the RN-Midwife. Dr. Matthews stated that through a resolution in the MSMA House of Delegates, we could make known how physicians stand on this issue and that we should work with the Nurses Association in getting needed legislation to change their practice act.

Dr. Gunn read a letter that had been received from the Missouri Association of Nurse Anesthetists. This Association is seeking approval of MSMA and other health organizations in issuing a joint statement regarding the qualifications of individuals administering anesthetics in the state of Missouri. Dr. Gunn asked that this matter be referred to the Legislative Committee for further study.

Mr. McIntyre indicated that the Governor of Missouri will probably call a special session of the Legislature in September and that legislation regarding Blue Cross and Blue Shield may come up again at that time.

It was moved that the report of the Committee on Legislative Affairs be accepted with commendation. The motion was seconded and adopted.

CONSUMER HEALTH INFORMATION PROGRAM

The Commission on Public Affairs had been asked by the Council to evaluate the Consumer Health Information Program developed by the University of Missouri, following the request of Dr. Arthur Rikli for MSMA approval. The Commission made the following recommendations regarding the CHIP Program:

1. Approve the CHIP and so notify Dr. Rikli. (To disapprove would not stop the program and would tend to represent negativism to the public.)
2. Volunteer assistance in whatever areas seems needed by the medical sector.
3. Respectfully request follow-up reports at each Council meeting by Dr. Rikli as to project developments.

The motion was made and duly seconded for acceptance of the three points. The motion carried with one dissenting vote.—**Referred to Miscellaneous Affairs Committee.**

APPOINTMENT OF EDITORIAL BOARD

■ Dr. Finnegan recommended that the following members be appointed to the Editorial Board of Missouri Medicine for 1972-1973: Drs. Robert K. Skillman, Kansas City; Wilfred E. Wooldridge, Springfield; James N. Haddock, St. Louis; William A. Leo, Kansas City; William M. Hart, Columbia; Leo T. Neu, Jr., Springfield; Richard D. Blim, Kansas City; John W. Berry, St. Louis;

Charles R. Willman, St. Joseph; Thomas M. Mier, St. Louis; Bentley A. Nelson, Kansas City; Donald J. Mehan, St. Louis; John S. Spratt, Jr., Columbia; Wayne A. Simril, St. Louis; Ben H. Koon, Bolivar; Raymond A. Ritter, Jr., Cape Girardeau.

It was moved that these members be appointed to the Editorial Board for 1972-1973. The motion was seconded and carried.—**Referred to Reports of Officers Committee.**

Meeting of Sept. 16-17, 1972

■ James C. Cope, M.D., Columbia, Chairman, called the meeting to order. Those present were Drs. Cope; Walter T. Gunn, St. Louis; E. A. Stricker, St. James; John I. Matthews, Jefferson City; Gerald L. Miller, Kansas City; Charles R. Gulick, St. Louis; John N. Martin, St. Joseph; Lysle M. Bach, Hannibal; Max S. Franklin, St. Louis; Louis P. Hetlage, Troy; William D. Bradshaw, Clinton; R. Allen Chandler, Kansas City; Howard J. McAlhany, Springfield; Claude W. Cooper, Thayer; Eugene T. Hansbrough, Poplar Bluff; J. Loren Washburn, Versailles; Stanley S. Peterson, Springfield; Arthur W. Neilson, St. Louis; Hector W. Benoit, Jr., Kansas City; William D. Mayer and William C. Allen, Columbia; M. Kenton King, Samuel Guze, George Thoma, St. Louis; R. K. Noback, Kansas City; Herbert R. Domke, Jefferson City; George Ladyman, Poplar Bluff; Mrs. Keith D. Jones, Warrensburg; Mrs. Charles Willman, St. Joseph; Messrs. John W. Noble, Kennett; John R. Smart and William Tetley, Fayette; Allen D. Smith, Kansas City; Hollister S. Smith, St. Louis; Gary L. Schnedler, Springfield; E. Mark Halvorson, Jefferson City; Ray McIntyre, Tom P. Fox, Royal O. Cooper and C. C. Swarens, Jefferson City, Staff.

Chairman Cope called the meeting to order and requested approval of the minutes of the June 3-4 Council Meeting. On motion of Dr. Gunn, duly seconded, the minutes were approved as distributed.

Dr. Cope then asked Dr. King of Washington University to introduce his guest. Dr. King introduced Dr. Samuel Guze, the new Vice-Chancellor for Medical Affairs of Washington University.

REPORT OF THE EXECUTIVE SECRETARY

Mr. McIntyre indicated that Mr. Cooper has been named to head one of the sections of the United Community Fund (UCF) campaign in Jefferson City.

Mr. McIntyre stated that flowers had been sent to the funerals of Dr. C. E. Burford, a Past-President of MSMA; Dr. Martyn Schattyn, a Past Vice-President of MSMA; and Dr. Wendell Scott. A resolution also was introduced into the AMA House of Delegates relative to Dr. Scott.

Mr. McIntyre said that at the last meeting of the Council, staff was asked to look into different possibilities for a meeting place in 1974 for the annual session, which is scheduled to be held in Kansas City. He asked Mr. Fox for a report. Mr. Fox stated that he had checked into the Alameda Plaza as a possible site and stated that the maximum number of guest rooms available for booking a convention would be 225. Last year, the MSMA occupied approximately 270 rooms. He further reported that Alameda Plaza did not have meeting room space required for the annual session. Mr. Fox reported that tentative dates have been set with the Crown Center and the Muehlebach Hotel. MSMA is holding the dates of April 4-7, 1974. It was pointed out that Southwest Clinical Society will hold its meeting at Crown Center in the fall of 1973. Mr. Fox asked the Council for approval to confirm the dates at one of the two places.

Dr. Chandler moved that the dates of April 4-7, 1974 be confirmed at the Crown Center in Kansas City for the 116th Annual Session. Motion was seconded and carried.

Mr. McIntyre stated that for the coming year, at the suggestion of the Council, MSMA is offering exhibitors a choice of either exhibiting or in lieu of that, giving a cash grant in the amount of the cost of an exhibit space. Mr. Swarens then reported that as of September 14, we have assigned ten exhibit spaces and three companies have indicated their intention to give cash donations in lieu of an actual exhibit space.

Past-Presidents of the MSMA

Fourteen Past-Presidents of the Missouri State Medical Association were introduced and honored at the Presidents' Banquet.

(Left to right, first row) Drs. Donald M. Dowell, Chillicothe; Walter T. Gunn, St. Louis; Harold A. Goodrich, Webster Groves; Robert Mueller, St. Louis; Gerald L. Miller, Kansas City; Victor B. Buhler, Kansas City; W. A. Bloom, Fayette.

(Second row) Drs. Byron M. Stuart, Boonville; Paul R. Whitener, St. Ann; Kenneth C. Hollweg, Kansas City; David N. Kerr, St. Louis; Joseph L. Fisher, St. Joseph; Raymond O. Muether, St. Louis; and Guy N. Magness, University City.

Mr. McIntyre asked that an additional item be placed on the agenda. He indicated that representatives from Central Methodist College in Fayette would present a proposal regarding a Community-Based Educational Manpower Project in Rural Mid-Missouri.

The Chairman then introduced Mr. Lee Mortenson to the Council. Mr. Mortenson is with the Department of Field Service of the AMA.—**Referred to Reports of Officers Committee.**

REPORT OF COUNCILORS

■ *District #10*—Dr. Hansbrough said that he reported at the last meeting regarding their local extended care facility. He stated that it is closed at the present time for repairs and feels that it probably will not open again. Apparently, the requirements of law relative to these facilities are quite demanding. He indicated that he understands these closings are happening in other parts of the state. He said that he feels this will bring on other problems. Some patients may now have to be in hospitals longer where there is no extended care facility.
